Why do we usually associate ill-health and disease with tenement dwellers in large cities? Why do those who work indoors lack the health and vigor of those, most of whose time is spent in the open? Why do you get drowsy in a warm poorly ventilated room? The answer to these questions is an inadequate supply of pure fresh air or rather

per hour. This air, after being breathed contains nearly five per cent water which, in twenty hours amounts to nearly one and a half gallons per cow. Multiply this amount by the number of cows in your barn and you can readily see that, if a large part of this moisture is permitted to condense in the barn it will soon cause rust and decay, thus materially shortening the life of the equipment and building.

A cow and the food she consumes may be likened to a stove and the fuel it burns. Close the drafts on a stove and the fire burns more slowly and finally is extinguished. Close all the fresh air inlets in a barn and the cows slacken up in production and if it were possible to absolutely close all inlets of pure air the cows would soon die. In both cases an abundant supply of oxygen as found in fresh air is necessary to convert fuel or food into heat or energy. Oxygen not only controls the rate but also the efficiency of converting food into heat and ener-

A Well Ventilated and Well Lighted Barn

gy. It is estimated that a cow needs an amount of pure air equal to twice the weight of her daily ration.

It is usually desirable to have the square surface of the intake flues slightly larger than that of the outlets. One square foot for every five or six cows should give a sufficient supply of fresh air. King's method of calculating the size of the flues will be of assistance under average conditions.

It is true that cows must be comfortable to give their maximum production and that the barn is kept comfortable only by the heat given off from their bodies, so that a sufficient number of animals should be kept in the barn to keep the temperature from falling below the freezing point and still permit the entrance of fresh air and the escape of foul air. When it is necessary to keep only a few head of cattle in a large barn it is desirable to partition off the unused section in real cold weather if at all possible.

Suppose for a moment we ignore the health of the animals and consider the effect of poor ventilation upon the life of the barn itself. A cow requires about sixty cubic feet of air per minute or 3600 cubic feet

59 x 25—1475 number of cubic feet of air for each animal.

1475—4.91 number of square feet in outtake flues.

300 (rate of flow)

If two outtake flues are used, they must each contain 2.45 square feet or 253 square inches.

MILK SITUATION IN NEW YORK

The sale of milk of Dairymen's League members for March started in on a much more lively basis than has been the case during winter months due to the improvement in general market conditions, notably the buying of milk in less limited quantities by manufacturers. Several large manufacturing companies again opened their plants in late February and early March, buying milk at the league price of \$2.10 a 100 pounds for 3 per cent milk, this price being the base figure in the 200 to 210-mile zone from New York city. The same variation of 4 cents per 100 pounds for each tenth per cent variation in butterfat content remained in force. The special contract markets in New York state, of Syracuse, Rochester, Buffalo and several smaller markets followed their same system of purchase with Dairymen's League members, the March price being adjusted to correspond with the \$2.10 base figure.

This situation is indeed encouraging to dairymen and their friends who have suffered many thousands of dollars in loss due to the curbed outlet since last fall when large milk manufacturing concerns refused to buy the farmers' milk. The brighter outlook has also come about in the face of extensive and expensive propaganda by milk companies in the winter months, which purposed to destroy the confidence of members in the Dairymen's League and to bring about the situation which existed prior to the war when the milk dealers bossed the situation.

Pooling Plan Progressing

The momentum of the pooling plan has so increased the promise for early operation for the Dairymen's League Co-operative Association in the pooling of milk proceeds that the promise in early March was for sale of milk under the pooling plan in April. At the close of the first week in March nearly 43,000 individual contracts had been signed and received by the home office of the League. It will be noticed that the base price of \$2.10 per 100 pounds is 48 cents or approximately 1 cent a quart lower than for February.

For approximately two years now the Dairymen's League has been selling its milk on the basis of 4 cents per 100 pounds variation for each tenth per cent increase in butterfat content. Previous to this time the variation of one point in butterfat was valued at 3 cents. There has been agitation from time to time to increase this sliding scale as the butterfat content increased. Some dairymen have claimed that the figure might well be four cents for each tenth per cent variation in butterfat between 3 and 4 per cent total content, and that 5 cents for each tenth per cent increase would be a fair figure between 4 and 5 per cent total butterfat content. Certainly under existing conditions and in view of the fact that above certain limits the cost of producing high butterfat milk is not proportional, the point may be well taken.

It is interesting to note that during February the lowest average price paid to farmers anywhere in the country was \$2.59 per 100 lbs. for average 3.5 per cent milk in the eastern north central states, which comprises Ohio, Indiana, Illinois, Michigan and Wisconsin. The south Atlantic farmers received the highest price of \$3.91 during the month, which includes the states from Delaware to Florida.—H. T. B.

The same factors which have made the De Laval Separator famous are back of the DE LAVAL MILKER

Just as the De Laval Cream Separator established new and higher standards of efficiency and construction, so is the De Laval Milker establishing higher standards among milkers. It is strong; durable; simple in construction and operation; easy to keep clean; saves time, and increases production.

The same policies which have made the De Laval Cream Separator the most popular and most widely used in the world are back of the De Laval Milker and are responsible for its rapidly increasing use.

Long ago the De Laval Company recognized the need for a mechanical means of milking, to place the dairy business on a machine basis. For over twenty years experiments have been conducted, and after many years of research, test and use, and not until the De Laval Company was absolutely sure its milker was actually a better way of milking, was it offered for sale. Now after four years of commercial use, in all sections of the country, owners are proving that it not only saves time and eliminates the drudgery of milking, but it actually increases the flow of milk even over good hand milking.

Service also helped make the De Laval Separator famous; and it is service back of the De Laval Milker that is helping

to create preference for it among dairymen. This means that the De Laval Milker will be properly installed, that you will be thoroughly instructed in its care and operation, and that the De Laval Company's interest in you, instead of ending there, just begins.

The De Laval Separator has rendered a service of inestimable value to the dairy industry—the De Laval Milker is doing the same. It removes the one great drawback to dairying—hand milking. American farmers realize the service, stability and integrity back of the name "De Laval," all of which is reflected in the rapidly increasing use of De Laval Milkers.

THE proper use of Dempwolf's Fertilizers will pay you better in crop returns than the work of "all the King's horses and all the King's men." No amount of work will make up for lack of fertility in your soil.

On the other hand, the right brand of Dempwolf's Fertilizers will be the most profitable farm "help" you can get. It will meet the needs of the crop you want to grow and also replace some of the plant food used by the crop you grew last year.

It is good farming judgment to see that your crops are fed as well as cultivated. Both are necessary to give you the best returns for your labor.

For 50 years we have been furnishing Dempwolf's Fertilizers to many of the most successful farmers of this section. Year after year, they have profited by our experience, as we have also profited by theirs. We have come to know fertilizer as you know your farm, and all that we know about making good crops by making good fertilizer is at the service of our customers.

Write us for information that will enable you to get exactly the right fertilizer for your needs.

Dairy Problems

Note—The answers to the following queries on matters of interest to dairymen were prepared by Professor A. A. Borland, head of the Department of Dairy Husbandry at the Pennsylvania State College.

THE RIGHT SIZE OF SILO

I have a 14x30 ft. silo and I want to keep about ten cows to be fed 250 days almost exclusively on silage, using some cottonseed meal, shredded fodder and plenty of rye straw. Will ten cows fed twice per day eat off sufficient silage to keep it from drying or will it be necessary to take down the silo, build new foundation, cut the hoops and take out sufficient staves to make the diameter 10 or 12 feet? These cows are kept for milk for the family, milk for pigs and chickens and calves and to make some wholesome "land improver." I don't expect a maximum yield and will not feed for it. Would it be better to keep four cows on heavy grain feed with hay and buy more fertilizer? We have plenty of land and a 20-acre pasture. Did I correctly interpret an article in Pennsylvania Farmer from State College from which I concluded that for silage one should use sorghum and soy beans since sorghum out-yields corn? Compare the grain value of corn with that of sorghum for silage. Our land has been in blue grass pasture for five years and therefore is free of weeds. Shall I

valuable pound for pound for feeding purposes as sorghum silage. Since soy beans may also be planted with corn as readily as with sorghum, it would appear that for Pennsylvania, corn would be preferable to sorghum for silage purposes.

Since your land is free from weeds, it will make little difference whether you hill or drill corn for silage. From the standpoint of convenience, especially if soy beans are planted with the corn, the drilling would perhaps be preferable for your condition.—A. A. B.

AN EFFICIENT DAIRY RATION

I have a cow which has been getting about twelve pounds of a grain mixture composed of 300 lbs. corn and cob meal, 300 lbs. bran and 100 lbs. oil meal besides all the mixed hay and corn fodder she will eat. Will you please tell me how I can improve this feed. The cow gave about 16 quarts of milk per day when first fresh but soon failed and is now giving about 8 quarts per day. She freshened in November. Some people say she has the wolf in the tail while others tell me this is a mistaken idea. I gave her a mixture of the following: aux vomica, sulphate of iron and ground gentian, but it didn't seem to do any good. Will you please tell me what is wrong with the cow and what I can do for her.—J. R. M., Montgomery Co., Pa.

J. R. M.—So far as "wolf in the

Building Silos at Greystone Jersey Farm, West Chester, Pa.

hill or drill my silage corn?—F. M. G., Sussex Co., Del.

F. M. G.—It is necessary to lower the surface of the silage about two inches daily in order to keep it from spoiling. In order to do this with a silo 14 feet in diameter, a herd of about 25 cows would be necessary when the cows are fed at the rate of 40 pounds of silage each per day. Hence your present silo is impractical for a herd of ten cows. It would be advisable to do as you suggest and narrow the diameter of the silo to 10 feet. The ideal plan would be to have two silos each about 8 feet in diameter. This would insure that the silage would be fed down rapidly enough to prevent spoiling.

There would be ample silo capacity in this way to enable you to feed silage 250 days if the surface were lowered 2 inches daily.

It will be better to keep ten cows with moderate feeding rather than four on heavy grain feeding from the standpoint of maintaining the fertility of your farm.

Well matured corn silage contains 1.1 pounds protein, 15 pounds carbohydrates and 0.7 pounds of fat per hundred pounds, while sorghum silage contains but .6 pounds of protein, 11.6 pounds of carbohydrates, 0.5 pounds of fat. It will therefore be evident that well matured corn silage is approximately 1 1/2 times as

tail" is concerned there is no such thing. This cow evidently does not get enough protein in her feed. If you were to modify your present grain mixture so that it would be composed of 100 pounds of corn and cob meal, 100 lbs. of wheat bran, 150 lbs. of linseed oil meal and 150 lbs. of cottonseed meal, you would have a grain mixture which when fed with mixed hay and corn stover would be much more efficient as a milk producer. The cow should have approximately one pound of grain mixture for every 31 pounds of milk she produces.—A. A. B.

FEEDING DAIRY CALVES

When calves are fed for veal their life story is soon complete and while errors in feeding may cut down the veal check they do not have a lasting effect on the income. But when calves are to be retained for a dairy business it is important to give them the best of care as such animals are apt to be a factor in the farm income for many years to come. Properly fed calves should grow into heifers with vigor and stamina and later become cows capable of producing a profitable amount of milk and more vigorous calves. The weaning has no place in the dairy business and the early feeding of the calf helps to make a good cow.

Making Farm Power History

SINCE the first Titan went out to the fields five years ago, the farming world has invested over seventy million dollars in Titan tractors. This is a record approached by no other 3-plow tractor. During those years of power history, countless experiments have risen and fallen, but Titan has advanced on a basis of practical design and workmanship to a success acknowledged the world around.

Entering into 1921, this Company has effected arrangements which include provision for time

payment and price reduction guarantees in the sale of its tractors. Titan owners are benefiting by this assistance and safeguard during the present period of uncertainty. Details may be had by application to any International Dealer or by letter from the address below.

Farmers who believe in plain drawbar and belt power work that will cut further the costs of farming, as this Company believes in manufacturing standards based on quality, will help to build higher the achievement of Titan in 1921.

NEW PRESIDENT OF STATE COLLEGE

In Dr. John Martin Thomas, the president-elect of the Pennsylvania State College, the institution is remarkably fortunate in obtaining a leader with a brilliant and diversified record, not only in educational affairs but in business and many phases of endeavor that have stamped him as one of the most popular and well-known educators in New England. President of Middlebury (Vt.) College since 1908, he has increased the student enrollment from 200 to 447 and the college endowment by more than a million dollars.

Dr. Thomas was born in Ft. Covington, a country town in New York, fifty years ago, and is the son of a minister. His early life has acquainted him with the feelings and desires of rural people, and he has always been greatly interested in agriculture and in the life and work of the farmer. His wonderful ability to adapt himself to any and all

DR. JOHN MARTIN THOMAS

Recently Elected President of the Pennsylvania State College

circumstances in which he is placed, causes his coming administration at the State College with its School of Agriculture to be looked forward to with assurances of success by all who have dealings with him.

Prior to becoming president of Middlebury College, Dr. Thomas was for twelve years pastor of the leading Presbyterian Church at East Orange, N. J. He is a graduate of Middlebury and the Union Theological Seminary, and studied abroad. He was chairman of the Vermont State Board of Education from 1910 to 1914, and as an appreciation of his popularity in Vermont, was sent as a delegate to the last Republican National Convention in Chicago. He expects to assume his duties at Penn State about April 15, or as soon thereafter as he can be released at Middlebury.

Dr. Thomas takes the place of Dr. Edwin E. Sparks who was forced to resign by ill health.

NEXT WEEK'S FARM WORK

Our harness will get one grand fixing up during the next period of bad weather. We don't follow the prescribed rules but just go at it early in the morning and keep at it hard all day. While in the village Saturday night I bought some castle soap, a gallon of neatsfoot harness oil; two pounds of copper rivets, an awl, wax and thread, needles and a harness punch. We have on hand an assortment of snaps, buckles, hame straps and several "trace sta-

pies" (you know what I mean; the irons that wear out where the traces connect onto the hames).

Before we begin working on the harness the frost-proof packing house will be cleaned out especially at the end nearest the stove and work bench. Ropes and poles will be suspended horizontally about six feet high. All the harness will be hung on these supports. It will be quickly rubbed with a coarse piece of burlap to remove the dust and dirt. Then it will be washed quickly with hot water and castile soap. This material takes the sweat out of the harness. While the work is going on the stove is kept hot. The men work faster and the harness dries up more rapidly. Before we get thru cleaning and washing, part of clean harness will be dry enough to soak with the harness oil. Oh sure, I know some people wouldn't think of cleaning up a harness until they had taken every buckle apart. That's too much work for us. Furthermore, we don't try to rub in the oil; we just rub it on thoroughly and generously, it soaks in itself. After the harness is cleaned and oiled, it is carefully examined and repaired. Here is something more you don't often see in print. You must realize that sewing harness is the prescribed method but we do very little sewing except on the lines. Riveting is much easier and quicker for a farmer than hand sewing.

We have three sets of double harness, two sets of heavy one-horse harness and half a dozen "hames and traces" for cultivating. During the busy season every Tom, Dick and Harry uses the horses. They may know little or nothing about harnessing a horse, therefore, when you understand the circumstances, you may not be alarmed when I tell you that we have found it advisable to rivet the hame straps, breast straps, breeching straps, girths, etc., so that the harness cannot be pulled apart. The trace chains must be fastened inseparably to the traces. Otherwise, the hame straps are pulled out for a hundred miscellaneous purposes; some fellow gets plowing in the back field and lays the breast straps down. Good-by breast straps! Breeching straps can be smuggled into service to hold up some hobo's breeches. Just so it goes; you may not agree with me but try my scheme on your old set of harness. Besides the regular harness and bridles, it must be remembered that the halters and collars especially need careful attention. After everything is repaired and adjusted, the entire thing gets another generous application of the harness oil. Then we gather up the tools and equipment so that we will have it when needed again.

—R. W. DeBaun.

A BIG TREE

I saw a short article in your paper relating to big trees. There is a red oak a few rods from our home which is 22 feet in circumference, 13 inches from the ground; 100 feet high and 70 feet spread of branches. The first limb is broken down and is 2 feet in diameter at largest measurement and more than 50 feet in length.

This is a line tree where W. L. Seigworth Graham heirs and Brishba Farms corner or extend, and one and a half miles from West Freedom, Clarion Co., Pa.—J. N. Brishba, Parkers Landing, Pa.

Kill the rats, and save money.

STUDYING THE POTATO MARKET

(Continued from Page Two).

age caused by the late blight and rot disease epidemic last summer and fall in potato fields. From New Brunswick thru to Pennsylvania the losses by rot found at digging time were very heavy, and the potatoes put into storage continued to rot in most cases.

Results of Other Rot Years

Next to the reports of the two bureaus of Crop Estimates and of Markets, a third and fourth class of scientists can throw light on the potato growers' problems. I refer to the plant doctors, as a farmer would say, though they prefer to call themselves plant pathologists, and to the teachers of farm management at our agricultural colleges. The plant doctors keep every year records of every plant disease as they find it in each state. These are got together in the Bureau of Plant Industry, Washington. From these records we find that the worst late blight and rot epidemics of the twenty years before 1920 were those of 1915, 1912, 1905, 1903 and 1902. Other years had had attacks, but in these five the disease was most widespread as well as severe. In each of these five seasons potato prices were higher towards the end of the season, March to June, than in any of the fall or winter months. The reason is plain. Consumers ate one end off the crop while the rot out of sight in the cellars was eating off the other end, and they met towards spring in the middle with but few potatoes left to eat the rest of the year.

The 1912 crop was the largest potato crop the United States ever grew for each consumer. With the population we had then its 420 million bushels figured out at the rate of no less than 4.43 bushels per capita, nearly three-eighths of a bushel more for every man, woman and child than last seasons' crop we have all thought to be so big. Late blight and rot were, bad that year, and in spite of the great size of the crop potatoes ran short in the spring. Prices at New York city were higher in May than in any other month of that season.

Southern New Crop Plantings

Plantings in the South this year have run about one-third smaller than last year. For Florida, the planting is estimated as being 16,000 acres against 23,000 last year. Southern farmers are short of money to buy the seed and expensive fertilizer needed to plant. This means that unless they have an unusually favorable season the South will not have many potatoes to compete with the rest of the northern hold-over.

Carlots Only Part of Whole Crop

With a minute's thought any one can see, if he or she wishes, something some do not, that the car lot movement is only a fraction of the whole crop, generally between one-quarter and one-third. Nearly 40,000,000 people on American farms eat a lot of potatoes, even more than the same number of city residents. A large share of city trade is supplied by wagon and auto truck. I live a few miles from a city of 25,000 people who seldom ever buy a car of potatoes from outside, all being supplied by local growers. It takes around 40,000,000 bushels of seed to plant our potato acreage of nearly 4,000,000 acres. Even in years without rot there must be some

shrinkage in storage. Records at Washington show that for the last twelve years the late or main crop of northern potatoes averages between 45 and 50 per cent used up by January first. The shipments later from January to along in June, farm consumption, shrinkage and seed take an immense quantity of potatoes to supply. This season there is less than three-eighths of the northern states' crop left to last thru. Some states as New York and Michigan have very heavy stocks, but it is the total of holdings that counts, and that is short many millions of bushels.

The Future of Potatoes

Two great factors are going to fight each other all the rest of this potato shipping season to set the price. The first great factor is the world wide fall in prices which has been going on for the last six or more months. No one wants to buy potatoes or anything else in any quantity when the article may be lower soon. With potatoes, as with everything else, most holders have been anxious to sell, even at a loss. Bankers and manufacturers believe that bottom has been reached. Many factories have started up again. We must expect that the recovery will be slow, and that it may not be fully in effect till our old potatoes are all gone. At any rate, it would be hard for potato growers to find a more discouraged lot of buyers than they have had since last fall. In one way hard times have been a blessing to potato growers if not to makers of automobiles. As one old farmer out in Michigan said, "A lot of these silk-shirt folks have quit eating grapefruit and took up potatoes again."

Against this falling price level we have the factors that consumption has been the heaviest ever known, that stocks are already reported short for the nation as a whole and that rot in storage will continue. The lesson of other blight and rot seasons is that potatoes will be higher towards the end of the season, even with a heavy crop.

WHITE GRUBS IN THE CORN

Severe injury from white grub is to be expected this season thruout southern New York, northern Ohio, the southern half of Michigan, northern Indiana and Illinois, eastern Iowa and southern Wisconsin. Every three years these regions are visited with outbreaks of this pest, because of the fact that it takes three years for the insects to pass thru their complete life cycle. There will be an abundance of small grubs this year of what is known to entomologists as "Brood A" of the white grub. They will occur especially in fields that were in grass last year, and potatoes nor corn should be planted on such land.

Ground that was in pure clover or even in corn last year is likely to be quite safe for planting to corn this year. A good rotation of crops to escape white grub injury is as follows: First year, oats or barley; second year, clover; third year, corn. Timothy or other grasses harbor white grubs from year to year and, therefore, in case they are grown, the land producing them should not be planted to corn, at least for the first year after it is broken from the sod.

HEATS WHOLE HOUSE | KEEPS CELLAR COOL | USES LESS FUEL

"STEWART" Onepipe Furnace

FARM HOMES by the hundreds are putting in this Powerful NEW Heater because it is built to meet farm home heating requirements. It HEATS the house thoroughly—every room—even in below-zero weather and KEEPS THE CELLAR COOL, so that it can be used as usual for storage of vegetables, fruits and foodstuffs.

STEWART ONEPIPE Furnaces are now giving users the same dependable, satisfactory service that STEWART Stoves and Ranges have been famous for since 1832. Back of this Furnace and built into it is the experience of eighty-nine years of successful stove and furnace manufacturing. It is RIGHT in principle, design, materials and construction, and can be depended upon absolutely for lifetime service and satisfaction.

ONEPIPE Furnaces are sized according to width across TOP of firepot, 20, 22, 24, etc. inches. In some makes the firepot tapers in, so that at grate the diameter is four or five inches LESS than top measurement. This makes its coal and consequently its heating capacity MUCH LESS than the STEWART, whose firepot, built EXTRA HEAVY, varies only 2 inches in top and bottom measurement, as illustration shows. A 22-inch STEWART ONEPIPE for example, about equals in heating capacity a 24-inch furnace of other makes.

THE STEWART ONEPIPE weighs from 100 to 300 pounds MORE than other makes of Pipeless Furnaces—and most of this EXTRA weight is in the Firepot and Grates where naturally the furnace has its hardest wear. Picture shows heavy Triangular Grates, the bars of which can be easily replaced when necessary. Also note large ashpit.

"The Lucile" A Stunning Serge SUIT DRESS

Special
Sale
Price
\$5.95

Without question the greatest dress bargain in the world! To prove it we gladly send it without a penny in advance. Decide only after you have seen and tried it on. The Lucile is the season's clearest offering, a charming, rich looking Serge Dress that can instantly be changed into a stylish, smart jacket suit by removing the detachable vest. Really 2 garments for the price of one. Modeled after the most expensive fashions—all the rage this Spring! Only a limited number can be offered at this special advance price. Act quick before this sale closes. Only one to a customer.

Send No Money

The Lucile is made in the newest spring style of excellent quality. Fully lined. Wearable Serge. Beautiful silk finish. Fastened on each side with strong snap fasteners. Long, tailored jacket collar beautifully trimmed with an all silk satin embroidery. Two-piece vest with buttoned placket. Plain ash belt. Skirt has two vertical pleats on each side of front—very stylish fullness. Ladies sizes 32 to 44. Cost, about 40 inches. Misses sizes 16 to 28 years. Possible every blue color only. Size year.

Send Now!

Just tell the coupon or write letter quick—no money now. Enclose \$1.00 and money order, or cash on arrival. Try on and examine. If not satisfied, it will be returned to you. If you are satisfied, it will be sent to you. If you are not satisfied, it will be returned to you. If you are not satisfied, it will be returned to you.

Of Interest to Farm Women and Girls

Early Spring Vegetable Dishes

THESE recipes may be helpful to the housewife who is puzzled as to how to make variations in the ways of serving the root and similar vegetables to which most of us are limited at this time of year.

Parsnip Cakes.—To 1 cup grated raw parsnip add 1 cup breadcrumbs, 2 well beaten eggs, and 1 tablespoon cooking oil. Season with salt and pepper, moisten with milk and shape into flat cakes. Bake in a pan containing meat drippings, basting the cakes frequently until they are nicely browned and crusty.

Parsnip Oysters.—These are made the same way, except that they are dropped on a hot greased griddle, once with oyster crackers.

Dishes all sorted, ready for washing, with soap, scouring powder, brush, cloths and pans at hand. Two good wire draining racks, one for the dishes and the other for pans and kettles would save wiping the dishes. If scalded with boiling water from the teakettle, the dishes will soon dry themselves.

and baked on both sides until brown. **Smothered Parsnips.**—Dice a thick slice of salt pork, and brown it in a saucepan; add 1 pint each of sliced potatoes and parsnips, season with salt and pepper, and lay over the vegetables a rich biscuit dough. Make a hole in the center of the dough, pour in 1 pint of meat stock, cover and cook in a quick oven for half hour.

Buttered Parsnips.—Boil the parsnips in a little salted water until they are tender, then drain well. Put 2 tablespoons butter, 1 tablespoon chopped parsley, salt and pepper in a saucepan, and when it bubbles up add 3 tablespoons cream. Pour this over the parsnips, and serve at once.

Parsnips Balls.—Mash boiled parsnips, season with salt, pepper and a little butter. Add a little flour and 2 well beaten eggs, shape into tiny balls, and fry in hot deep fat. Nice to serve with roast meat.

Salsify or Vegetable Oysters. Oyster Plant Potpie.—Soak and scrape the salsify roots, then cook until tender in boiling water. Slice them, and place in a pan lined with biscuit dough, which has been lightly baked. Fill up with a thin sauce, add a little shredded codfish, sprinkle with pepper and salt, dot with butter, cover with a sheet of pastry, and bake until thoroughly done. Be sure to prick the pastry cover well.

Salsify Fritters.—Wash and scrape the roots and put at once into cold water to which a little vinegar has been added to keep the salsify look-

fine enough cabbage to make two quarts, put it in a saucepan of boiling water, add 1 teaspoon of salt, and boil slowly for 20 minutes. Make 1 pint of white sauce (with flour, butter and milk), and alternate layers of the cabbage and this sauce in a baking dish until the dish is full, or all ingredients are used. Sprinkle buttered breadcrumbs over the top, and bake in a quick oven 20 minutes. Sometimes grate some cheese over the top to add a different flavor, and to increase the nutritive value of the dish.

Russian Cabbage.—Cut a head of cabbage very fine, soak it in cold water half an hour, then drain very dry. Boil in salted water 15 minutes, drain again, return to the kettle, add 1 pint cream, 1/2 teaspoon salt and a little pepper, and let simmer gently 10 minutes. Then mix in gently 1 tablespoon butter, and serve at once.

Celery and Dried Beef.—Dice the outer stalks of celery until you have two cups. Boil until tender, which will take about 15 minutes. Save 1 cup of the celery water, add to it 1/2-pound of dried beef, and simmer gently a few minutes while you make a white sauce of 2 tablespoons flour, 2 tablespoons butter or other fat and 1 cup milk. Add this to the celery and dried beef, cook 10 minutes, preferably in a double boiler, and serve on toast or with baked potatoes.

Carrot Fritters.—Clean and scrape some small firm carrots, and cut in two lengthwise. Boil until tender in salted water, drain and cool. Make a batter of 1 egg, 1 cup flour, 1/2 cup milk, a little salt and 1 tablespoon melted fat, mix thoroughly, and add 1 teaspoon baking powder. Dip the pieces of carrot in this batter, then drop them into deep hot fat, and fry until brown. Serve hot.

Harvard Beets.—Wash the beets, and cook in boiling salted water until tender; drain, skin and cut into thin slices. Mix half cup of sugar and half of cup corn starch and half cup vinegar, and let boil 5 minutes. Pour this over the beets and let them stand in a warm place half an hour. Then add 2 tablespoons butter, and serve immediately.—Mrs. F. W. Stillman, New Jersey.

Good seed measures the difference between success or failure in most gardens.

The farmers' wife who washes dishes at this sink has hot and cold soft water from an attic tank and very cold drinking water from a spring on the hill above the house coming to her sink by these three faucets. The hot water is made by a kerosene water heater attached to the tank that sets near the furnace in the cellar. The tank is heated by the furnace in the winter.

A GOOD COMMUNITY ENTERPRISE

Our town has established a lecture and concert course. Last year we had seven numbers, and this year eight, consisting of lectures on current subjects of interest, concerts of vocal and instrumental music, impersonations, etc.

The price of each course ticket has been only \$1.75. And some of the numbers cost over \$100 to bring here. Nevertheless our little village of only 400 people, with the surrounding farmers, have supported the enterprise so well that we have never run behind. The numbers are held in our high school auditorium, which is really quite a fine hall. We are four miles from a railroad station. Every evening there have been large, interested, appreciative audiences, and the numbers have been wonderfully educational for us, particularly our young people.

We have no movies, and this sort of culture leads to appreciation of the better forms of entertainment. No one is trying to make money out of it, for it is purely a community effort to give ourselves and our families something good and pay expenses. Every one who buys a ticket a member of our Lyceum Association, but the price of the course ticket is all the dues there are to pay.

Our course year extends from October to about May 1. If there is any money left, it is used for making the next year's course a little better. We sell quite a good many one-night tickets, for which we charge 35 cents. We put out pamphlets advertising the course, the dates, the features and giving pictures of the entertainers. Cuts are furnished by the bureau thru which we arrange for the course, and the local advertising which we get to put in the pamphlets pays for the expense of circulating them. Our ushers are high school pupils, who are given the courses free for their service; we have a different set for each night.—C. J. S., Cumberland Co., New Jersey.

VENTILATION WITHOUT DRAFTS

The simplest way to have fresh air without drafts, according to the leaders in health work, is to place a folding screen in front of the window. This method of cutting off drafts, is not adequate if there is a strong wind and it does not prevent snow and rain from blowing into the room.

A simple window ventilator may be made by covering an ordinary window screen with heavy unbleached muslin, or by making narrow strips of board into a frame the width of the window and the desired height—usually 4 to 6 inches—and stretching one thickness of unbleached muslin across the frame, tacking it firmly on all four sides.

One of these ventilators should be inserted both above the top sash and below the bottom sash of the window, since the air will circulate more freely if the windows are open at the top as well as at the bottom.

It is desirable to open two windows on different sides of the room in order that there may be a cross circulation of air.—N. Y. Agricultural College.

Take Castor Oil This Way.—Another use for the all-important castor oil. A small amount rubbed into the scalp is an excellent hair tonic.

How about a small home orchard, planted especially for table use?

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give just measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3248.—Pretty Dress for a Junior. Pattern is cut in 3 sizes: 12, 14 and 16 years. For a 14-year size 4 1/2 yards of 36 inch material will be required. As here shown figured foulard was used. One may have this in dotted Swiss, organdie or challie. A crush girle or sash of silk or ribbon in a contrasting shade forms a pretty finish. Pattern, 10 cents.

2990.—Simple Frock for a Little Miss.—One may choose gingham, percale or lawn for this style, or checked or plaid suiting. An attractive effect is gained by cutting waist and pockets bias. The sleeve may be finished in wrist or elbow length. The pattern is cut in 5 sizes: 2, 4, 6, 8 and 10 years. Size 6 requires 2 1/2 yards of 36-inch material.—Pattern, 10 cents.

3480.—School Dress.—The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. A 10-year size requires 3 1/2 yards of 38-inch material. Pattern, 10 cents.

3491.—Party Frock for Girls.—This pattern is cut in 4 sizes: 6, 8, 10 and 12 years. A 10-year size will require 3 1/2 yards of 38-inch material. The panel may be omitted, and the sleeve finished in wrist or elbow length. Voile and lace, taffeta and ribbon, serge and satin, could be combined for this design. It is also good for gingham and percale. Pattern, 10 cents.

Good Cleaner for Rugs.—One tablespoonful of turpentine in a quart of warm water not only cleans carpets and rugs, but brightens them up a lot and is apt to discourage moths.

Boys and Their Sisters.—Teaching a boy to treat his sister with respect and courtesy is not making a "sissy" of him. It is insuring that when he gets to be a man he will unconsciously treat other peoples' sisters with the same respect and courtesy, and some day will thank his mother for the early training.

WOMEN FOLKS!

YOU CAN MAKE THIS DRESS-FORM EASILY IN YOUR HOME AT A TOTAL COST OF ONE DOLLAR

A Special Introductory Offer

To make the Liberty Dress Form the only things required are a needle and thread, a pair of scissors and a bowl of water, and the Liberty Dress Form set. The form is easily shaped on your figure. A friend, daughter or your husband can do it in an hour. It requires no skill—merely the following of simple directions enclosed in the box. And when it is completed you have a dress form on which you can fit your dresses accurately. It is your figure reproduced exactly.

More Style

Think of the improvement in the fit of your clothes! Proper fitting is all important in making stylish waist, dress or suit. That is why ordinary dress forms don't always do. The Liberty Dress Form does away with all doubts and fears about fitting, because it reproduces your figure exactly.

How easy it would be to take some silk or other dainty material and in a spare hour or two run up a pretty little blouse for Easter with the help of your Liberty Dress Form—a blouse that really and truly fits—with no need for later alterations and trouble. Or a substantial house dress of gingham! No fuss or bother trying the half-finished garment on yourself or on a dress form that does not truly

represent your figure. The cost of the Liberty Dress Form is so small that you can easily provide one for each of the womenfolk in your family, and thus save all dress-maker's bills.

Used by U. S. Demonstration Agents Don't think of the Liberty Dress Form as something new and untried. Demonstration Agents of the United States Department of Agriculture have been busy making dress forms exactly like this in many communities throughout the country. They are demonstrating how quickly and simply these forms are made—urging women to make them in their own homes, thus saving the cost of expensive mechanically-regulated or papier-mâché forms and the trouble of putting the dress on a living model. Already thousands of these forms have been made and are in successful use in many homes.

Act Now

Fill out and mail coupon below along with your dollar—now. You will then receive the Liberty Dress Form set in ample time to make up your Easter clothes. The set is made for 3 sizes—small, medium and large and consists of a shirt of special make for this purpose, a sponge, a full supply of tape and complete instructions for making. The picture above shows how the dress form will appear when completed. Don't delay. Send now.

Liberty Paper Company, 52 Vanderbilt Avenue, New York, N. Y.—Enclosed is one dollar, for which please send me, post-paid, the Liberty Dress Form set, as advertised. C

The Voice of the Pack

by Edison Marshall

CHAPTER XIII

BERT CRANSTON waited in a clump of exposed thicket on the hillside until he saw two black dots, that he knew were Dan and Snowbird, leave the Lennox home. He lay very still as they circled up the ridge, noticing that except for the pistol that he knew Snowbird always carried, they were unarmed. There was no particular reason why he should be interested in that point. It was just the mountain way always to look for weapons, and it is rather difficult to trace the mental processes behind this impulse. Perhaps it can be laid to the fact that many mountain families are often at feud with one another, and anything in the way of violence may happen before the morning.

The two passed out of his sight, and after a long time he heard the crack of Snowbird's pistol. He guessed that she had either shot at some wild creature, or else was merely at target practice—rather a common proceeding for the two when they were on the hills together. Thus it is to be seen that Cranston knew their habits fairly well. And since he had kept a close watch upon them for several days, this was to be expected.

He had no intention of being interrupted in this work he was about to do. He had planned it all very well. At first the intermittent snowstorms and the thaws between had delayed him. He needed a perfect snow crust for the long tramp over the ridge; and at last the bright days and the icy dawns had made it. The elder Lennox was still helpless. He had noticed that when Dan and Snowbird went out, they were usually gone from two to four hours; and that gave him plenty of time for his undertaking. The moment had come at last to make a thorough search of Lennox's house for those incriminating documents that Dan had found near the body of Landy Hildreth.

The only really dangerous part of his undertaking was his approach. If by any chance Lennox were looking out of the window, he might be found waiting with a rifle across his arms. It would be quite like the old mountaineer to have his gun beside him, and to shoot it quick and exceptionally straight, without asking questions, at any stealing figure in the snow. Yet Cranston felt fairly sure that Lennox was still to helplessness to raise a gun to a shooting position.

He had observed that the mountaineer spent his time either on the fireplace divan or on his own bed. Neither of these places was available to the rear windows of the house. So, very wisely, he made his attack from the rear.

He came stealing across the snow—a musher of the first degree. Very silently and swiftly he slipped off his

snowshoes at the door. The door itself was unlocked, just as he had supposed. In an instant more he was tiptoeing, a dark, silent figure, thru the corridors of the house. He held his rifle ready in his hands.

He peered into Lennox's bedroom first. The room was unoccupied. Then the floor of the corridor creaked beneath his step; and he knew nothing further was to be gained by waiting. If Lennox suspected his presence, he might be waiting with aimed rifle as he opened the door of the living room.

He glided faster. He halted once more—a moment at the living room door to see if Lennox had been dis-

“that the doors of my house were no longer open to you.”

“You did say that,” was Cranston's guttural reply. “But you see I'm here just the same, don't you? And what are you going to do about it?”

“I probably felt that sooner or later you would come to steal—just as you and your crowd stole the supplies from the forest station last winter—and that probably influenced me to give the orders. I didn't want thieves around my house, and I don't want them now. I don't want coyotes, either.”

“And I don't want any such remarks out of you, either,” Cranston answered him. “You lie still and shut up, and I suspect that sissy boarder of yours will come back, after he's thru embracing your daughter in the snow, and find you in one piece. Otherwise not.”

“If I were in one piece,” Lennox answered him very quietly, “instead of a bundle of broken bones that can't lift its arms, I'd get up off this couch, unarmed as I am, and stamp on your lying lips.”

But Cranston only laughed and

deer horns over the fireplace, and was entirely exhausted from it. He had succeeded in getting down from the couch, though wracked by agony, but had been unable to lift himself up in reach of the gun.

Cranston read his intention in one glance. Lennox knew it, but he simply didn't care. He had passed the point where anything seemed to matter.

“Tell me where it is,” Cranston ordered him. Again he pointed his rifle at Lennox's wasted breast.

“Tell you where what is? My money?”

“You know what I want—and it isn't money. I mean those letters that Failing found on the ridge. I'm thru fooling, Lennox. Dan learned that long ago, and it's time you learned it now.”

“Dan learned it because he was sick. He isn't sick now. Don't presume too much on that.”

Cranston laughed with harsh scorn. “But that isn't the question. I said I've wasted all the time I'm going to. You are an old man and helpless; but I'm not going to let that stand in the way of getting what I came to get. They're hidden somewhere around this house. They wouldn't be out in the snow, because he'd want 'em where he could get them. By no means would he carry them on his person—fearing that some day he'd meet me on the ridge. He's a fool, but he ain't that much of a fool. I've watched, and he's had no chance to take them into town. I'll give you—just five seconds to tell me where they're hidden.”

“And I give you,” Lennox replied, “one second less than that—to go to blazes!”

Both of them breathed hard in the quiet room. Cranston was trembling now, shivering just a little in his arms and shoulders. “Don't get me wrong, Lennox,” he warned.

“And don't have any delusions in regard to me, either,” Lennox replied. “I've stood worse pain, from this accident, than any man can give me while I yet live, no matter what he does. If you want to get on me and hammer me in the approved Cranston way, I can't defend myself—but you won't get a civil answer out of me. I'm used to pain, and I can stand it. I'm not used to fawning to a coyote like you, and I can't stand it.”

But Cranston hardly heard. An idea had flamed in his mind and cast a red glamour over all the scene about him. It was instilling a poison in his nerves and a madness in his blood, in his dark brain. Nothing seemed real. He suddenly bent forward, tense.

“That's all right about you,” he said. “But you'd be a little more polite if it was Snowbird—and Dan—that would have to pay.”

Perhaps the color faded slightly in Lennox's face; but his voice did not change.

“They'll see your footprints before they come in and be ready,” Lennox replied evenly. “They always come by the back way. And even with a pistol, Snowbird's a match for you.”

“Did you think that was what I meant?” Cranston scorned. “I know a way to destroy those letters, and I'll do it—in the four seconds that I said, unless you tell. I'm not even sure I'm going to give you a chance to tell now; it's too good a scheme. There won't be any witnesses then to yell around in courts. What if I choose to set fire to this house?”

“It wouldn't surprise me a great deal. It's your own trade. Lennox

shuddered once on his place on the floor.

“I wouldn't have to worry about those letters then, would I? They are somewhere in the house, and they'd be burned to ashes. But that isn't all that would be burned. You could maybe crawl out, but you couldn't carry the guns, and you couldn't carry the pantry full of food. You are nearly eighty miles up here from the nearest occupied house, with two pair of snowshoes for the three of you and one dinky pistol. And you can't walk at all. It would be a nice pickle, wouldn't it? Wouldn't you have a fat chance of getting down to civilization?”

The voice no longer held steady. It trembled with passion. This was no idle threat. The brain had already seized upon the scheme with every intention of carrying it out. Outside the snow glittered in the sunlight, and pine limbs bowed with their load; overhanging with that curious winter silence that, once felt, returns often in dreams. The wilderness lay stark and bare, stripped of all delusion—not only in the snow world outside but in the hearts of these two men, its sons.

“I have only one hope,” Lennox replied. “I hope, unknown to me, that Dan has already dispatched those letters. The arm of the law is long, Cranston. It's easy to forget that fact up here. It will reach you in the end.”

Cranston turned thru the door, into the kitchen. He was gone a long time. Lennox heard him at work: the crinkle of paper and then a pouring sound around the walls. Then he heard the sharp crack of a match. An instant later the first wisp of smoke came curling, pungent with burning oil, thru the corridor.

“You crawled from your couch to reach that gun,” Cranston told him when he came in. “Let's see you crawl out now.”

Lennox's answer was a curse—the last, dread outpouring of an unbroken will. He didn't look again at the glittering eyes. He scarcely watched Cranston's further preparations: the oil poured on the rugs and furniture, the kindling placed at the base of the curtains. Cranston was trained in this work. He was taking no chances on the fire being extinguished. And Lennox began to crawl toward the door.

He managed to grasp the corner of the blanket on the divan as he went, and he dragged it behind him. Pain wracked him, and smoke half-blinded him. But he made it at last. And by the time he had crawled one hundred feet over the snow crust, the whole structure was in flames.

The red tongues spoke with a roar. Cranston, the fire-madness on his face, hurried to the outbuildings. There he repeated the work. He touched a match to the hay in the barn, and the wind flung the flame thru it in an instant. The sheds and other outbuildings were treated with oil. And seeing that his work was done, he called once to the prone body of Lennox on the snow and rushed away into the silences.

Lennox's answer was not a curse this time. Rather it was a prayer, unuttered, and in his long years Lennox had not prayed often. When he prayed at all, the words were that of Samson—that for a moment his strength might come back to him.

CHAPTER XIV

Two miles across the ridges, Dan and Snowbird saw a faint mist blowing between the trees. They didn't recognize it at first. It might be

fine snow, blown by the wind, or even one of those mysterious fogs that sometimes sweep over the snow.

“But it looks like smoke,” Snowbird said.

“But it couldn't be. The trees are too wet to burn.”

But then a sound that at first was just the faintest whisper in which neither of them would let themselves believe, became distinct past all denying. It was that menacing crackle of a great fire, that in the whole world of sounds is perhaps the most terrible. They were trained by the hills, and neither of them tried to mince words. They had learned to face the truth, and they faced it now.

“It's our house,” Snowbird told him. “And father can't get out.”

She spoke very quietly. Perhaps the most terrible truths of life are always spoken in that same quiet voice.

“He can crawl a little,” Dan called to her. “Don't give up, Snowbird mine. I think he'll be safe.”

They mounted to the top of the ridge; and the long sweep of the forest was revealed to them. The house was a singular tall pillar of flame, already glowing that dreadful red from which firemen, despairing, turn away. Then the girl seized his hands and danced about him in a mad circle.

“He's alive,” she cried. “You can see him—just a dot on the snow. He crawled out to safety.”

“Haste makes waste,” he told her. “Keep your feet on the ground, Snowbird; the house is gone already and your father is safe. Remember what lies before us.”

The thought sobered and halted her. She glanced once at the dark face of her companion. Dan couldn't understand the strange light that suddenly leaped to her eyes. Perhaps she herself couldn't have explained the wave of tenderness that swept over her—with no cause except the look in Dan's earnest gray eyes and the lines that cut so deep. Since the world was new, it has been the boast of the boldest of men that they looked their fate in the face. And this is no mean looking. For fate is a sword from the darkness, a power that reaches out of the mystery, and cannot be classed with sights of human origin. It burns out the eyes of all but the strongest men. Yet Dan was looking at his fate now, and his eyes held straight.

They walked together down to the ruined house, and the three of them sat silent while the fire burned red. Then Lennox turned to them with a half-smile.

“You're wasting time, you two,” he said. “Remember all our food is gone. If you start now, and walk hard, maybe you can make it out.”

“There are several things to do first,” Dan answered simply.

“I don't know what they are. It isn't going to be any picnic. Dan, a man can travel only so far without food to keep up his strength, particularly over such ridges as you have to cross. It will be easy to give up and die. It's the test, man; it's the test.”

“And what about you?” his daughter asked.

“Oh, I'll be all right. Besides—it's the only thing that can be done. I can't walk, and you can't carry me on your backs. What else remains? I'll stay here—and I'll scrape together enough wood to keep a fire. Then you can bring help.”

He kept his eyes averted when he talked. He was afraid for Dan to see them, knowing that he could read

the lie in them.

“How do you expect to find wood—in this snow?” Dan asked him. “It will take four days to get out; do you think you could lie here and battle with a fire for four days, and then four days more that it will take to come back? You have two choices: burn green wood that I'd cut for you before I left, or rainsoaked dead wood under the snow. You couldn't keep either one of them burning, and you'd die in a night. Besides—this is no time for an unarmed man to be alone in the hills.”

Lennox's voice grew pleading. “Be sensible, Dan!” he cried. “That Cranston's got us, and got us right. I've only one thing more I care about—and that is that you pay the debt! I can't hope to get out myself. I say that I can't even hope to. But if you bring my daughter thru—and when the spring comes, pay what we owe to Cranston—I'll be content. Heavens, son—I've lived my life. The old pack leader dies when his time comes, and so does a man.”

His daughter crept to him and sheltered his gray head against her breast. “I'll stay with you then,” she cried.

“Don't be a little fool, Snowbird,” he urged. “My clothes are wet already from the melted snow. It's too long a way—it will be too hard a fight, and children—I'm old and tired out. I don't want to make the try—hunger and cold; and even if you'd stay here and grub wood, Snowbird, they'd find us both dead when they came back in a week. We can't live without food, and work and keep warm—and there isn't a living creature in the hills.”

“Except the wolves,” Dan reminded him.

“Except the wolves,” Lennox echoed. “Remember, we're unarmed—and they'd find it out. You're young, Snowbird, and so is Dan—and you two will be happy. I know how things are, you two—more than you know yourselves—and in the end you'll be happy. But me—I'm too tired to make the try. I don't care about it enough. I'm going to wave you good-by, and smile, and lie here and let the cold come down. You feel warm in a little while.”

But she stopped his lips with her hand. And he bent and kissed it.

“If anybody's going to stay with you,” Dan told them in a clear, firm voice, “it's going to be me. But aren't any of the cabins occupied?”

“You know they aren't,” Lennox answered. “Not even the houses beyond the North Fork, even if we get across. The nearest help is over seventy miles.”

“And Snowbird, think! Haven't any supplies been left in the ranger station?”

“Not one thing,” the girl told him. “You know Cranston and his crowd robbed the place last winter. And the telephone lines were disconnected when the rangers left.”

“Then the only way is for me to stay here. You can take the pistol, and you'll have a fair chance of getting thru. I'll grub wood for our camp meanwhile, and you can bring help.”

“And if the wolves come, or if help didn't come in time,” Lennox whispered, passion-drawn for the first time, “who would pay what we owe to Cranston?”

“But her life counts—first of all.”

“I know it does—but mine does not count at all. Believe me, you two, I'm speaking from my own desires when I say I don't want to make the fight. Snowbird would never make it thru alone. There are

the wolves, and maybe Cranston too—the worst wolf of all. A woman can't mush across those ridges four days without food, without some one who loves her and forces her on! Neither can she stay here with me and try to make green branches burn in a fire. She's got three little pistol balls—and we'd all die for a whim. Oh, please, please—”

But Dan leaped for his hand with glowing eyes. “Listen, man!” he cried. “I know another way yet. I know more than one way; but one, if we've got the strength, is almost sure. There is an ax in the kitchen, and the blade will still be good.”

“I'll cut a limb with my jackknife for the handle. There will be nails in the ashes, plenty of them. We'll make a rude sledge, and we'll get you out too.”

Lennox seemed to be studying his wasted hands. “It's a chance, but it isn't worth it,” he said at last. “You'll have fight enough, without tugging at a heavy sled. It will take all night to build it, and it will cut down your chances of getting out by pretty near half. Remember the ridges, Dan—”

“But we'll climb every ridge—besides, it's a slow, down grade most of the way. Snowbird—tell him he must do it.”

Snowbird told him, overpowering him with her enthusiasm. And Dan shook his shoulders with rough hands. “You're hurting, boy!” Lennox warned. “I'm a bag of broken bones.”

“I'll tote you down there if I have to tie you in,” Dan Failing replied. “Before, I've bowed to your will; but this time you have to bow to mine. I'm not going to let you stay here and die, no matter if you beg on your knees! It's the test—and I'm going to bring you thru.”

He meant what he said. If mortal strength and sinew could survive such a test, he would succeed. There was nothing in these words to suggest the physical weakening that both of them had known a few months before. The eyes were earnest, the dark face intent, the determined voice did not waver at all.

“Dan Failing speaks!” Lennox replied with glowing eyes. He was recalling another Dan Failing of the dead years, a boyhood hero, and his remembered voice had never been more determined, more masterful than this he had just heard.

“And Cranston didn't get his purpose, after all.” To prove his words, Dan thrust his hand into his inner coat pocket. He drew forth a little, flat package, half as thick as a pack of cards. He held it up for them to see. “The thing Bert Cranston burned the house down to destroy,” he explained. “I'm learning to know this mountain breed, Lennox. I kept it in my pocket where I could fight for it, at any minute.”

Cranston had been mistaken, after all, in thinking that in fear of himself Dan would be afraid to keep the packet on his person, and would cravenly conceal it in the house. He would have been even more surprised to know that Dan had lived in constant hope of meeting Cranston on the ridges, showing him what it contained, and fighting for it, hand to hand. And even yet, perhaps the day would come when Cranston would know at last that Snowbird's words, after the fight of long ago, were true.

The twilight was falling over the snow, so Snowbird and Dan turned to the toil of building a sled.

(Continued Next Week.)

Surface Goodness

“Her goodness is all on the surface,” said a woman in criticism of her neighbor.

That is exactly where goodness ought to be. The proper place for the biggest, reddest berries is at the top of the basket.

No admiration is due the man whose conduct must be excused on the plea that he has a good heart. He who prides himself on always saying what he thinks usually has a headful of disagreeable thoughts.

We all suffer lapses from our own ideals, of course; but usually we are at heart just about what we seem to our neighbors to be. You are sure to be deceived about yourself if you indulge the habit of excusing your unlovely conduct on the score of the secret goodness of your intentions.

It is a sound principle of civilization that men are to conceal the unlovely and disgusting from the eyes of their neighbors. A good man displays to the world his best self, not his worst. As he covers his body with seemly garments so he covers his ugly moods with courtesy and fellowship.

If you have a smile in your system, display it where it may cheer your fellows.

If you have any goodness in you, let's see it.

ALVIN E. MAGARY.

turned. He was lying still, however, so Cranston pushed thru.

Lennox glanced up from his magazine to find that unmistakable thing, the barrel of a rifle, pointed at his breast. Cranston was one of those rare marksmen who shoots with both eyes open—and that meant that he kept his full visual powers to the last instant before the hammer fell.

“I can't raise my arms,” Lennox said simply. “One of 'em won't work at all—besides, against the doctor's orders.”

Cranston stole over toward him, looking closely for weapons. He pulled aside the woolen blanket that Lennox had drawn up over his body, and he pushed his hand into the cushions of the couch. A few deft pats, holding his rifle thru the fork of his arm, finger coiled into the trigger guard, assured him that Lennox was not “heeled” at all. Then he laughed and went to work.

“I thought I told you once,” Lennox began with perfect coldness,

fled Lennox's feet with a cord from the window shade.

He went to work very systematically. First he rifled Lennox's desk in the living room. Then he looked on all the mantles and ransacked the cupboards and the drawers. He was taunting and calm at first. But as the moments passed, his passion grew upon him. He no longer smiled. The rodent features became intent; the eyes narrowed to curious, bright slits under the dark lashes. He went to Dan's room, searched his bureau drawer and all the pockets of the clothes hanging in his closet. He upset his trunk and pawed among old letters in the suitcase. Then, stealing like some creature of the wilderness, he came back to the living room.

Lennox was not on the divan where he had left him. He lay instead on the floor near the fireplace; and he met the passion-drawn face with entire calmness. His motives were perfectly plain. He had just made a desperate effort to procure Dan's rifle that hung on two sets of

ward, tense.

“That's all right about you,” he said. “But you'd be a little more polite if it was Snowbird—and Dan—that would have to pay.”

Perhaps the color faded slightly in Lennox's face; but his voice did not change.

“They'll see your footprints before they come in and be ready,” Lennox replied evenly. “They always come by the back way. And even with a pistol, Snowbird's a match for you.”

“Did you think that was what I meant?” Cranston scorned. “I know a way to destroy those letters, and I'll do it—in the four seconds that I said, unless you tell. I'm not even sure I'm going to give you a chance to tell now; it's too good a scheme. There won't be any witnesses then to yell around in courts. What if I choose to set fire to this house?”

“It wouldn't surprise me a great deal. It's your own trade. Lennox

Champion

Dependable Spark Plugs

THE FORD Manual says, "There is nothing to be gained by experimenting with different makes of plugs."

"The make of plugs with which the Ford engines are equipped when they leave the factory are best adapted to the requirements of our motor."

Champion "X" Spark Plugs are standard equipment on Ford Cars and have been since 1911.

HENS WITH BRONCHITIS

My chickens make a peculiar wheezing sound when breathing, as though they had asthma. They keep their mouths partly open but do not seem to have any growth in mouth or throat. Their eyes are clear and they have good appetites. The trouble seems contagious. Can you tell me what to do for them?—K. J. H., Chester County, Pa.

K. J. H.—Hens with bronchitis must be promptly treated before they lose in weight and become very weak. Add 8 drops of turpentine to a tablespoonful of castor oil and give that dose to each of the sick birds. This trouble is sometimes difficult to cure and every effort must be made to prevent it by housing the birds in coops free from dampness. Exposure to cold raw winds or rains often cause certain birds to have bronchitis. Isolate sick birds at once to prevent the trouble from spreading; feed the healthy birds balanced rations to keep them in good vigorous condition.

COLDS AND ROUP

Is there anything to be done for chickens when their eyes swell and they turn blind?—C. F., Morris Co., New Jersey.

Reader, Lancaster Co., Pa.—The germ in a turkey egg rapidly reduces in vitality as it grows older and the quicker incubation starts the greater the chances of obtaining vigorous poults. Usually a turkey hen lays 15 or 18 eggs and then becomes broody. The eggs should be gathered as soon after laying as possible and stored where the temperature will not range far from 55 degrees. We would not wish to hold turkey eggs more than two weeks if it can be avoided and the quicker they can be placed under hens or turkey mothers the greater the chances that they will hatch. This year the open winter has probably started the turkeys to laying earlier than usual. In an average year they seldom lay much before April first which enables the poultryman to obtain poults sometime in May when the weather is right for their growth.

Leghorn pullets hatched in April week of March or beginning of April early enough to produce eggs in November? I mean to lay steadily in November, when fed with the right kind of feed, or will they moult if hatched that early? My turkey hen is blue-headed and is losing weight. I can't see that she has any disease, but she doesn't eat half of the time. —Reader, Lancaster Co., Pa.

Good Picking for the Plymouth Rocks

C. F.—When hens eyes swell shut and they become blind it is usually due to a severe cold. It may rapidly develop into roup and this disease is indicated by the bad odor and the devitalized appearance of the bird. There is no satisfactory cure for roup and such birds should be killed and burned. Colds may be prevented by good feeding methods in a house free from draughts and dampness. Color the drinking water with permanganate of potassium and it will help to keep colds from spreading. Rubbing the head of a sick bird with camphorated vaseline may reduce swelling. Spraying the nostrils of a bird with a slight cold with the potassium permanganate solution may cause a quick cure. The best treatment of roup and colds will always be in prevention of the trouble.

When the heads of turkeys turn dark and they are droopy and off feed there is a danger of the disease called blackhead. This is incurable and has nearly closed up the turkey business in some sections. It can often be prevented by breeding from healthy unrelated stock on a range not infected with the disease.

LEG WEAKNESS

I have two chickens which cannot stand on their feet but a little while. They will not eat or drink. I have to force food down their throats. Will you please send me a remedy for them.—T. McG., New Jersey.

T. McG., New Jersey.—As you do not state any symptoms but the apparent leg weakness it is difficult to tell the trouble. Leg weakness or

SAVING TURKEY EGGS

I am anxious to know about how long one can keep turkeys eggs while turning them every day. My hen started laying the third week in January. Some say I can keep them until April but I can hardly believe that. Are Leghorn chicks in last

paralysis sometimes occurs among old fowls but treatment does not usually prove satisfactory and it is best to kill the birds and try to prevent it among the remainder of the flock by feeding a balanced ration in sanitary quarters so that the flock will remain vigorous.

When chickens will not eat, nothing is gained by trying to force feed them. A sick chicken seems to know by instinct that it cannot be helped by more food. Leg weakness most often occurs when birds are fed heavily to force either growth or egg production. It seems to afflict young cockerels more than other birds because their weight increases faster than their strength.

MORE MONEY FOR EGGS

Along with other farm products, eggs have gone down in price within the past few months and we hear poultrymen talk of quitting the business or of hatching fewer chicks this year. Of course many things about the farming situation wear a pessimistic color and some poultrymen are not slow in predicting dire disaster for their business. When conditions look that way to a man it is time to seek some way of changing conditions. I have recently had an opportunity to look over the eggs gathered up by a country merchant in a certain community. This man makes a weekly trip thru the country surrounding the village where he does business and takes the farmers' eggs in exchange for grain and groceries. Later he grades them, as best he can, and ships them to a city dealer. I have shipped eggs the same day and received two cents or more per dozen, from the same dealer, more than the merchant got for his best grade.

As the eggs are gathered up on his weekly rounds, they are found to be of all sizes and colors and in every possible sort of condition from a sanitary standpoint. Many have to be washed and this alone puts many of them in the lower grades. The candling process quickly shows if an egg has been scrubbed. Of course it is better to wash a dirty egg than to ship it in an unclean condition but the keeping qualities of that egg have been considerably lowered. Better plan to have clean nests so the eggs will not get dirty.

My experience with this merchant taught me how important it is to make and sell good eggs. Wherever it has been tried, the plan of adopting a standard for a community or association has been found to work admirably. The farmers get together and agree upon some one breed, then they use a distinctive trade mark or carton and consumers soon learn that they can rely upon that brand of eggs. The plan of standardizing the product has worked so well with whatever line it has been tried out that there seems no reason why it should not be particularly successful with eggs and poultry. I have learned of several communities where the poultrymen have concentrated on one breed and employed one of their number to handle the shipping end. In a certain town in a Western state the farmers got together and agreed to keep nothing but White Leghorns. One of the number was chosen to handle the shipping. Each member was provided with a rubber stamp with a certain number. Eggs were stamped with that number. At first all eggs were candled and graded by the shipper but as the members learned the standard they were supposed to live

up to, the candling was abandoned. Now the eggs are sent to a certain buyer and with every case a slip is enclosed asking that anything unsatisfactory about the eggs be reported at once, together with the number stamped upon the eggs in question. It has been found that eggs from this association are quoted several cents in advance of ordinary fresh eggs.

To bring the best prices, eggs should be shipped to market twice a week. Let the buyer understand that your eggs are not more than four days old and you will be pretty sure to get the top of the market. It may be said, then, that eggs should be fresh, of uniform coloring and, for first grade, should weigh at least 24 ounces per dozen. Eggs weighing less than two ounces each should be graded as pullet eggs. Poultrymen keeping two hundred layers can ship their own eggs. They will find it profitable to adopt a distinctive carton and cater to the highest-class trade. Some years ago it was possible to procure printed cartons holding one dozen each, at a price not exceeding one-half cent each. Today such cartons will cost more, but it pays to use them.

The writer knows a man who has contracted to furnish three cases of fresh eggs per week to an ice cream parlor. He gets five cents per dozen more than the market price. The proprietor is willing to pay extra because he can depend upon the supply the year around. In this case, it is not necessary to grade to a certain size for the reason that it is necessary to use some pullet eggs in the fall to make out the contracted quota.

Whatever plan is adopted, it is certain that farmers should adopt some method of marketing more profitable than selling to the village store. It is also true that they can sell a better product by making a little extra effort. When prices are going down, it is a good time to consider these things. It is one of the oldest of economic laws that when prices are high, almost anything goes, but when prices are down, only the best is wanted.—C. H. Chesley.

CULLING HENS REDUCES COSTS

Throwing out the low producing hen in the many poultry culling demonstrations held during the past year in Pennsylvania under the direction of county farm agents and Pennsylvania State College specialists, proved to be a very profitable act, according to statistics just announced by the college extension service.

A total of 453 culling demonstrations were conducted in sixteen counties, the chief purpose being to show the farmers who came from miles around how to identify the poor producing hen. The meetings were attended by 10,957 people, who represented flocks totaling \$50,000 birds. Each farmer was given an opportunity to handle the birds and pass his judgment regarding them. Forty thousand birds were examined by farmers during demonstrations and 14,500 were discarded as culls.

Showing that the work of culling out the low egg yielders is profitable, the records indicate that the remaining birds, or those retained as showing the marks of good producers, laid as many eggs as the entire number had laid prior to the culling. Therefore, the feed bill for these farmers was cut one-third without decreasing the output. The saving in feed was estimated at \$310,000.

Everything for the Modern Farm and Dairy

The Modern Hover

The Reliable Blue Flame Wickless, Oil-Heated Colony Hover

This hover has the same chick capacity as the coal-burning brooder. A few of the special points on this oil-heated hover are as follows:

Burns Coal Oil.
Steady Blue Flame.
Safe and Convenient.
No Wick to Trim.
Abundance of Heat.
Visible Oil Feed.

Simple in Construction.
No Coal Smoke or Gas.
No Oil Fumes.
Flow of Oil Regulated Automatically.
Easy and Comfortable to Operate.
Inexpensive and Economical.

Our Special Incubator

An exceptionally good machine at an extremely moderate price.

Reliable Incubators

Come in all sizes from the Baby Grand of 50 Egg Capacity for family use, to Standards of 250, 350 and 450 Egg Capacity and Giant Wonders, of 680 and 1000 Egg Capacity. Made in both hot air and hot water styles. The best values upon the market today. Let us prove this to you.

WEATHEROMETER

Foretells Weather Hours in Advance
WEATHER and PROFITS
Profitable Farming Depends, to some extent on Prophets-Weather Prophets

"Is it going to rain within the next twenty-four hours?" is often a question that properly answered, means dollars and cents. Here is a combined Barometer and Thermometer that will do this. It is 13 inches long and 4 1/2 inches wide.

ACCURATE AND DURABLE

The Thermometer is of Oxidized brass with a 5-inch scale. The Barometer is of polished brass with easy reading dial. It is a finely made instrument and has always sold at a rather high price. However, by a very fortunate purchase, we are able to offer it to our readers, postpaid, by parcel post on the following terms:

PENNSYLVANIA FARMER SPECIAL OFFER

Secure three subscriptions, either new or renewa. or the balance of this year and all of next, or to Jan. 1, 1923, at \$1.00 each, send them in together with your check or money order covering same and we will send you a Weatherometer by return mail.

PENNSYLVANIA FARMER, 261 South Third Street, Philadelphia, Pa.

Farm Labor—A Social Survey

(Continued from Last Week).

Certain farmers have arbitrarily paid their best men from 15 to 25 per cent more than their basic pay. Contrary to general opinion, it has not caused any difficulty. If possible the man of special ability should be given special duties to perform and these duties should be suggested in the name of his position such as mechanic, truck driver, tractor driver, or orchard man. This raises him above the position of the hired hand. No evidence was found where the low wages seemed to be a particularly good business investment. Where sufficient wage was paid to secure a better farmhand, the increased efficiency seemed to more than offset the difference in wage. When it is considered that the difference between a poor and a good man is not more than \$300 a year and that a poor man by his lack of intelligence and judgment may produce \$500 worth of damage in one-half a day, it is very questionable whether the farmer uses good business methods in trying to secure the cheapest labor possible.

Recreation

The three most important factors which must be considered are wages, housing, and recreation. Recreation is as essential in the life of a normal person as food or a place to sleep. The complaint is often made by the farmer that the farmhand goes to the city where he can have moving picture shows and go to dances.

If it is recognized that the desire for recreation is a normal human instinct, it is perfectly natural that the farmhand should seek some form of recreation if none is made possible on the farm. We often wonder why the excitement of the city is attractive. From a standpoint of reason it would seem that people should be more satisfied in the country where living conditions are more healthful. Every person wishes to find expression and this can only be found thru the use of the senses, as experienced in such form as color, music, motion and sound. People enjoy the city because it is possible to experience sensations thru the sense faculties more than it is in the country. The human being enjoys a change and new experience. Nothing is so deadly as monotony. Recreation implies social contact with friends and other people. It is thru social contact that expression can be given. The farmer who assumes that his farmhand may be contented without recreation is building on a false assumption. It was surprising to find how little opportunity for recreation is offered to the average tenant farmhand. Thru the entire year, there are no gatherings of people in the community where the farmhands could feel that they were taking an active and interested part. No provision is made for social functions or activities and the opportunity for any kind of recreation is almost entirely absent.

Many farmers are prone to condemn the moving picture theatre in the small country towns. Towns of 5000 people only having a moving picture show twice a week and that held in a building which could not possibly meet the demand for seats. The farmers would be far more logical if they would stimulate the development of recreational centers and places of amusement in their immediate neighborhood rather than allowing their farmhands to become dissatisfied and go to the city in order to find recreation. It would be a wise policy to make it possible for tenant farmhands to attend a moving picture show or some form of gathering at least once or twice a month, even if the cost was borne by the farmer himself. A community spirit must be developed if the farmhand is expected to remain within the community. It is his inherent right to be able to meet other people and attend gatherings where he can come into close contact with others. Without this opportunity, the possibility of expression is decidedly limited. The farmers of the community should arrange at certain times of the year to have outdoor festivities where music would be furnished and some sort of entertainment given. These gatherings should be decidedly informal and given for the benefit of the farmhand and not of the farmer. The farmer has his opportunities for recreation and social intercourse thru other means. A suggestion in this regard might well be taken from the Blossom Festival held each year in the Santa Clara Valley in California. This festival celebrates the blossoming of the prune trees and gives an opportunity for all of the people for miles around to gather together for games and general recreation.

In tabulating the percentage of turn-over from year to year, it was found that approximately fifty per cent of the families where the entire income was furnished by the man, changed work from year to year. This is a very unfortunate and costly condition and one which should be carefully studied. In many cases the changes were made from one farm to another where there was no improvement in the conditions. It seemed that there was no reason for the change except for the sake of new surroundings. Evidently, it was an attempt to make up for lack of recreational and social conditions as found on the farm. The families where the children were grown and working in nearby industries seemed to be much more permanent. There seemed to be no choice in the permanency between colored and white labor.

It was found that a surprisingly large number of tenant farmhands owned phonographs. It was also surprising to find how little they were actually used. The main reason for their disuse was due to the small number of records which most of the families owned. After a record has been played over and over again the listeners become tired and the phonograph is neglected. Considering that so many of the farmhands own phonographs it would be very helpful if the farmers in the community would establish a phonograph record library in connection with the public library of the community, where it would be possible to exchange records very much the same as books are exchanged. The question of books and magazines is also quite important. The traveling library is now coming into vogue in many communities and is an excellent idea. Books and magazines are taken around from house to house by automobile. In many tenant houses there was not a single book with the exception of the Bible in the entire house. The women and the children would especially enjoy current magazines with illustrations.

even if they were a few months old. Arrangements should be made for distributing magazines and books among the tenant hands:

Use the Schools

More use can be made of the country schools as recreational and educational centers for the parents as well as the children. Gatherings of the parents in the school for entertainments and musicals should be stimulated. This would be of great assistance in helping to supply the lack of any recreational features. The school is the ideal place for gatherings, as it is usually centrally located and at all times available. Improvements should be installed so that the school houses could be used in the evenings. Unfortunately, among the farmers visited, there was practically no common interest in school, church or recreation between the farmer and the farmhands. It must be considered that the farmhand finds his opportunity of expression on the farm, just as much as the farmer and the farm which does not take into consideration his right of expression and make it possible for him to find something in life besides the monotony of working, eating and sleeping, does not meet its fundamental obligation to society. Industry has definitely recognized that it owes something more to its employee than the wage which he receives. The employee has reached the point where he is demanding more than mere wage. He is demanding opportunity of expression. If this opportunity cannot be found on the farm, which after all is the foundation of civilization, conditions are radically wrong. The life of the large percentage of farmhands is a sordid monotony of existence which allows for no opportunity of expression and seems to have no outlet. It is hard to imagine what could be more deadening than an existence where every cent of money is spent week by week with no recreational opportunity and no prospect of future conditions which will make anything else possible. Unfortunately, the attitude of the farmer is very often antagonistic to the welfare of the farmhands. This may be typified by an expression of a certain farmer in regard to this investigation, who remarked that "he would rather not have anyone talk to the farmhands, as it might start them to thinking." Unless the farmer can conduct his work with a sense of partnership with his employee and with the feeling that he is furnishing him with an opportunity for expression, there can be but little satisfaction in farming. Certainly, there is very little of the real spirit of Christianity present if that attitude is not taken. One farmer remarked that he would rather not farm, than feel that his farmhands were antagonistic toward him and did not enter into their work with a real spirit of interest. In passing, it may be remarked that this farmer furnished privileges amounting to over \$400 per year.

He paid his hands \$3 per week over the average wage and furnished them with tenant houses having running water and other improvements and built with an idea of being attractive, rather than merely habitable. His tenant hands were strikingly superior and in conversation with them it was possible to feel the sense of interest and co-operation which they took in the farm work.

In many cases complaints were

(Continued on Page 30).

Cultivate With a TORO

This light, 2-row cultivator does thorough work at low cost

Farmers who have kept accurate records of crop-raising costs find that planting and cultivating per acre with a TORO costs about \$2.50, including depreciation. Doing this work with horses in the usual manner would cost around \$7 per acre—and this does not include keeping horses during

the idle part of the year. While the actual figures vary in different localities, TORO owners everywhere are finding that this efficient power cultivator pays for itself during the first season of use. It cultivates more in a day than can be done by two men and four horses.

Cultivator

Why the TORO does thorough work

Not only does the TORO perform work cheaper than horses, but it does better work.

The TORO is the only power cultivator which steers by the front driving wheels. The drive wheels respond immediately to the steering gear, causing instant action of the gangs. This means the greatest possible flexibility in the field, and permits cultivating row crops in uneven hills with ease. It means less hoe work and better crops.

The TORO has two speeds forward. In spring when plants are small and fragile you can work slowly and carefully. Later on, when your crops are larger you can work at full speed. Throughout the summer your TORO will work fast and steady, unaffected by heat and long hours.

This small, low and light motor cultivator works close to fences and under trees in orchard tillage.

Ample Power for the Big Jobs

Besides cultivating, the TORO is used for disk-ing, harrowing, drilling, planting, pulling the mower, hay loader, binder, manure spreader, road drag, etc. It has power enough to meet all the requirements of the average size farm. Standard unit design—frameless and compact.

TWO Machines with One Power Plant

With the addition of a few extra parts the TORO cultivator can be readily changed into a two-plow tractor. A simple monkey-wrench job. Sold either as a cultivator or a tractor with or without the parts to change from one to the other. This is an exclusive TORO advantage. It gives you two motor driven machines with one power plant. With this feature the TORO displaces horses for more jobs than any other tractor made.

Tractor

Buy Your Cultivator Now

Get the extra parts later, if you wish. Many seasons of use under all farming conditions throughout the United States have demonstrated TORO reliability and economy beyond question. Our catalog gives complete information; write today.

BUTTERMILK for Hogs and Poultry

Experienced feeders know that there is no better feed for growing hogs and poultry than buttermilk. A regular supply, however, has been difficult or impossible to obtain and feeders have had to do without it. A process has now been worked out for putting this valuable feed on the market in a condensed form, called SEMI-SOLID BUTTERMILK. By simply adding water you get real, genuine buttermilk with all its great feed value.

Semi-Solid Buttermilk, like fresh buttermilk, is an appetizer and tonic, as well as a feed, and keeps hogs in prime condition.

The lines consume it eagerly and thrive on it. It is a wonderful tonic and conditioner as well as a most valuable feed. Readers of this paper interested in getting rapid growth and good health should read SEMI-SOLID BUTTERMILK. For free sample and information about Semi-Solid Buttermilk, and (red line) lines and poultry for greater profits, write to J. H. Nester & Co., Dept. 3062, No. 3 Chestnut St., Philadelphia, Pa., or Consolidated Products Co., Dept. 3612, Lincoln, Neb.

The State Fair and Livestock Improvement

By W. H. TOMLHAYE

THE two questions frequently asked by visitors from outside the State of Pennsylvania are: "Where is the Pennsylvania State Fair held?" or "Why don't you have a State Fair?" To a newcomer in the state or to those not familiar with conditions in the state, it does seem strange that Pennsylvania does not have one of the largest and best fairs of any state in the Union. The same question arises in the minds of many people in the state who read about the wonderful fairs held annually in adjoining states. There seems to be no logical reason why there is no state fair in Pennsylvania and the only excuse seems to be that such an institution has never been established. This is due in part to the fact that in the minds of some people the agriculture of the state has been overshadowed by other industries and that a certain group of men have been opposed to the establishment of a State Fair for fear it would interfere with the progress and development of the local fairs. There is no justification for these arguments, as Pennsylvania's agriculture is of importance, which is borne out by the fact that the value of the ten leading crops produced in the state during the past year are valued at more than \$316,000,000. This does not include the value of farm animals, fruits, vegetables, poultry and dairy products that are produced within the state.

An Open Shed—Type Used for Dairy Stock at Pennsylvania State College

The live stock development in this country has been due to a number of different agencies. The work of the Live Stock Breeders' Associations, the Agricultural colleges, various local associations, the live stock papers and fairs have all contributed toward the development of the live stock industry. In those states where a successful state fair has been held the live stock improvement and development has been more rapid than in the states without a fair. Among the best illustrations of such states are Ohio, Iowa, Minnesota, California, Texas and many others. In each of these states the development of the agricultural resources and the live stock industry has been more

rapid than in Pennsylvania and a few of the states that do not have a "real" state fair. Practically every one of the leading agricultural states has a well established state fair that is the pride of the agricultural interests within these states. In nearly every instance where no state fair is held, some large district fair takes the place of the state fair. In many of the states throughout the middle and central west, several district fairs are held in addition to the state fair and in each case are well supported and benefitted because of the existence of the state fair.

Few people fully realize what a state fair would mean to Pennsylvania. It would afford an opportunity to exhibit the agricultural and live stock products of the state at one central point and thus make a comparison of the crops produced and progress made in the different localities. The farmers would have

More Work From Your Horses

Horses, like people, work according to the way they feel. On warm spring days, horses sweating under winter coats don't feel right and don't work right. You can't dry them off properly, resulting in colds, stiffness and other horse ailments.

Clip Your Horses This Spring

It will put life into them and keep them fit and ready. Progressive farmers clip their horses in the spring with the \$14 at your dealer's, or shipped by us on receipt of \$2, balance on arrival. Guaranteed to please or money back.

15% More Wool

This Stewart No. 9 Machine gets 15% more wool than the best hand shearing. Shears quickly, does not cut the sheep, and anyone can use it.

Price, complete, \$22 f.o.b. Chicago. Your dealer has it, or you can buy from us by sending \$2 with order and paying balance on arrival. Catalog No. 69 shows complete line of hand and power operated machines. Write for it.

PLEASE say: "I saw your adv. in Pennsylvania Farmer."

from the sections in which these fairs were held, went home and determined to breed better live stock and in a number of instances purchased pure bred sires or established pure bred herds or flocks. Pennsylvania farmers would not only have an opportunity to see the splendid exhibits of live stock, but would meet personally and become acquainted with the breeders who produce these herds and flocks. It would be an education that can only be gained by a personal contact with the people who can discuss these problems from personal experience. A visit to a great live stock show by the farm boys of the state and a personal talk with the live stock breeders would be a great inspiration to most boys and give them an idea of the field for live stock production.

Pennsylvania is the missing link of a big eastern fair circuit for the exhibition of live stock. A circuit composed of Ohio, Michigan, New York, Eastern States Exposition, Pennsylvania and Virginia would draw exhibits of all classes of live stock from the leading breeding establishments east of the Mississippi River. Many of the live stock breeders feel that the east is a new territory for the introduction of breeding animals and await the opportunity to show the farmers what they have accomplished.

A Truck Load of Hogs Worth \$19,000

Practically all the breed record associations would support a state fair by offering special premiums for live stock. All of the record associations are doing a great deal of breed extension and promotion work thru the national and state fairs. They bring to the farmers the information which they desire about the merits of the different breeds of live stock. Thru the work of the breed associations and the exhibits from the leading breeding establishments of the country, there would be brought to within easy reach of the farmers of the state the object lessons and best results of animal breeding in this country. For the farmers of Pennsylvania to make the trip to the Ohio State Fair or to the Eastern States exposition to see such exhibits is expensive and requires too much time. It is a matter of economy to establish a fair within the state where the people can have the same opportunity to see the live stock and other exhibits which are provided for the people of adjoining states.

There has recently been some agitation by the secretaries of county fairs in the state against the proposed state fair bill before the Legislature. Their contention is that a State Fair will reduce the attendance at county fairs and decrease the num-

ber of exhibits. This has not been the experience of the local fairs in other states. The state fair becomes a feeder for county fairs and gives local exhibitors ideas which will be put into practice when making up local exhibits. It serves as an inspiration to the county fair exhibitors and the local fair will profit by such examples. When the Eastern States Exposition was started at Springfield, Mass., in 1917, it was opposed by many of the local fair associations in Massachusetts and Connecticut. Their opposition was based on misinformation and a lack of knowledge of the benefits to be derived from a large exposition in close proximity to a local fair. They found that instead of injuring the local fair, it has stimulated interest taken in the fair by the management, visitors and exhibitors. The establishment of a state fair will have a healthy effect upon some of the local fairs of the state that are agricultural fairs only in name. It will make them pay more attention to developing the agricultural and live stock exhibits and give less attention to questionable side shows.

There is a new era at hand in the type of fair which the people demand. All fairs, local, state or national must become educational institutions if they are to survive. The days for side shows, cheap games of

Belgium

Imported—Duty Free

Melotte

Invented by Jules Melotte, the Edison of Europe, the Belgium Melotte is the only single-bearing bowl separator ever made.

This patented bowl hangs from one frictionless ball bearing and spins like a top. It is self-balancing. It skims as perfectly after 15 years' use as when new. Positively can not ever get out of balance—cannot vibrate and thus cause cross currents which waste cream by re-mixing with the milk. The 600 lb. Melotte turns as easily as the 200 lb. machine of other makes. Spins for 25 minutes unless brake is applied. No other separator has or needs a brake. The Melotte bowl has solved the problem of perfect skimming.

Post Office.....

The storm was bad enough in the village, but when I reached open country I found it had settled down to a regular old-fashioned blizzard.

LAST winter I got sick and tired of having a house that was never really comfortable and warm. We were always wearing sweaters and coats and piling expensive coal on the fire, without seeming to do any good. So I looked around and finally bought an Andes System One Pipe Furnace.

We installed the whole furnace in about eight hours work and next day, in the morning, I built a fire in it. And that very afternoon along came the worst storm of the whole winter. It didn't amount to much at first, but by three o'clock we knew what we were in for. By the time I started home the storm seemed bad enough in the village. Those big elms down by the church were creaking and cracking in the wind. But when I reached open country, I found it had settled down to a regular old-fashioned blizzard.

Naturally I was worried about the people at home. There was that new Andes furnace that had never been tried out at all, and I just kept wondering whether I'd find them comfortable or freezing cold. I got there at last and stamped in the way you do when you come in out of a storm. And believe me I had a surprise waiting for me. That house was warmer than it had ever been before. It was great. It seemed just as if I had stepped into a patch of warm summer sunshine. Wife was smiling. Sister was smiling. I tell you it was a relief to find them there as cozy and warm as if they didn't even know there was a blizzard. I'll swear by the Andes now as long as I live.

One of the best things about an Andes just at this time of the year is the fact that it can be put in in one day. This is because there are no heat pipes to put in, so you avoid the cost, the confusion and the delay of ripping open floors and walls to put in the pipes. There is only one register hole to cut, and that is quickly done. Then, after you get the Andes in, you have first of all, the nicest,

"Those big elms down by the church were creaking and cracking in the wind."

most comfortable heat, and, equally as important, you have a furnace that saves fuel money. The Andes always saves fuel and sometimes cuts it down one-third or even one-half.

There are several reasons why the Andes is a fuel saver. One is that it has a "dead-air-space" type of inner casing which permits the circulation, on which the efficiency of a one pipe or pipeless furnace depends, to continue. Any other kind of inner casing slows down the circulation and makes you burn more coal while at the same time you get less heat.

People are constantly writing us such testimonials as this from Mr. E. F. Moody, Lebanon, N. H., a picture of whose house is shown on this page: "Gentlemen—last fall we installed your No. 240 One Pipe Furnace and have had no trouble in keeping nine rooms, heated to 70 degrees or over all winter on six tons of coal, which is less than it took to heat six rooms with stoves."

The Andes One Pipe water pans give the air in the home just the right amount of moisture to guard your health. It is a fact that a room heated to a temperature of 68° with moist air is more comfortable than a room at 75° with dry, burned air. It not only increases your comfort, therefore, to heat your home with Andes One Pipe moist air, but it also cuts down your coal bills.

The Andes is guaranteed to give perfect satisfaction, or it will be taken out and the full purchase price returned to you.

The Ralston-Nolan Land Tax Bill

A Discussion of the Proposed Tax on Large Land Values

By S. HOWARD PATTERSON

Instructor in Economics, University of Pennsylvania.

Editor's Note—Because of the interest which farmers have taken in the Ralston-Nolan Bill we had the following article prepared by Professor Patterson. We believe it is an impartial discussion of the plan and will help to clear up many points upon which farmers have been doubtful. The bill will likely be re-introduced at the special session of Congress.

WHEN the Armistice was signed in November, 1918, the last chapter in the military history of the great war was closed. The financial problems arising from a world conflict remained unsolved. Each belligerent nation had a staggering load of debt and taxation. Statesmen talked glibly in terms of millions of men and of billions of dollars, whereas in former wars thousands of men and millions of dollars had been the units of measurement. The country had gasped when Congressional appropriations crossed the billion mark. The Secretary of the Treasury has estimated as the necessary income for the next fiscal year a sum between four and five billions of dollars. In Europe generations yet unborn will pay taxes on stupendous war debts. The other alternatives in some countries seem to be either national bankruptcy or the repudiation of their debts. In America the per capita debt, especially in proportion to our national wealth, is not so great. Although we are the world's creditor nation, one of the most popular issues at home today is the reduction of taxes. This financial burden is a veritable "Old Man of the Sea." The debt may be funded and passed on from generation to generation, but that is not disposing of it. It is not part of our problem to decide what portion of the debt should be paid by this generation and what part should be left to our children. In any case we must look forward to a continued high rate of taxation. This is our first premise and one frequently ignored because of its unpopularity. The paper must be paid although we may quarrel as to the method of payment.

"The tariff a local issue" was made the presidential campaign slogan of a generation ago. The same might be said of taxation. Various individuals are vigorously agitating for the repeal of certain taxes which they find oppressive—that is which hit them. They feel that the industrial prosperity of the country will be furthered by other kinds of taxes the final burden of which seems to lie in another direction. The political atmosphere is full of taxes and rumors of taxes.

On February the seventh, 1920, Mr. Nolan introduced into the House of Representatives a bill taxing large land values which was subsequently referred to the Ways and Means Committee. The

measure is technically known as House of Representatives Bill No. 12397 or more popularly as the Ralston-Nolan Bill. It proposes to "provide for the raising of public revenues by a tax upon the privileges of the use and enjoyment of lands of large value." The bill defines land in its true economic sense; that is, including all natural resources and excluding all improvements, which represent labor and capital. "That for the purposes of this Act land is defined to be the surface of the ground, with all easements in, on, and over the same whether covered by water or not, and including water powers and rights, natural growths, if any, of land and including wild forests, natural deposits of coal, minerals of all kinds, oils, gases, peats, waters and all other substances and not including the improvements the result in whole or in part of the application of labor to land." The rate of taxation is one per cent upon all land values in excess of ten thousand dollars. "That all persons, firms, associations and corporations owning land in excess of

ministration and the enforcement of the act.

Let us see what this proposed law would mean. Suppose Mr. Brown owns a farm worth thirty-five thousand dollars. Let us assume his house, barn, shed, fences and other improvements or capital to be worth ten thousand dollars. This would make the value of the land itself twenty-five thousand dollars. As there is an exemption feature of ten thousand dollars Mr. Brown would have to pay a tax upon fifteen thousand dollars worth of unimproved land value. At one per cent his yearly tax bill under this law would be one hundred and fifty dollars. It must be remembered, however, that this tax is a new federal tax independent of and in addition to the existing local or general property tax, which covers buildings as well as land value.

It is estimated that the Ralston-Nolan Bill will yield an annual revenue of one billion dollars or one-fourth of the total needs. It represents the invasion of a new field by federal taxation. The general property tax in this country is usually regarded as within the sphere of the local governments of the individual states. It required a special amendment to our Federal Constitution to give Congress the power "to lay and collect taxes on incomes from whatever source derived without apportionment among the several states and without regard to any census or enumeration." From an economic point of view the differentiation between land itself and the improvements upon it is very important. Unimproved land including all natural resources is a distinct element in production from the improvements upon land which are the result of labor and represent a third element, namely capital. This theoretical distinction is beset with certain practical difficulties. Improvements upon land are of such a permanent nature that they tend to become part of the land. Witness the labor expended in clearing or draining a piece of land for farming. Shall we say that a stream is a natural resource but that an irrigation ditch of the same size is capital? How can fertilizer be classified? The practical difficulties of differentiating between land itself and the improvements upon it are great. City real estate assessors find it difficult to apportion the value of a building between the value of the building itself and the site or land value.

It would seem that the small farmer would hate little to fear. The advocates of the Ralston-Nolan Bill estimate that ninety per cent of the farmers of the country would be untouched. The measure is designed to hit at large holdings (Continued on Page Four).

Subsidizing The Rural School

What a System of State Aid Has Done for Minnesota.—By R. P. Crawford

NOTE—This is the second of a series of articles by Mr. Crawford on Consolidated Schools. The third, "Remaking Rural Communities," will appear in an early issue.

MINNESOTA has plenty of money for its rural schools and believes in spending it. Nearly everywhere one goes in that state he finds consolidated schools. There is probably no state in the Union that has handled the financial problems of the consolidated school as well as has the State of Minnesota. The requirements which every consolidated school must live up to are probably also the highest of any in the Union. The state has all sorts of subsidies for its consolidated schools, such as consolidated school aid, transportation aid, state graded aid, high school aid, and the apportionment of the current school fund.

If one did not know this, he might indeed wonder how Minnesota has made such great strides in consolidation. Even in the most northern parts of the state are good consolidated schools, and I recall that there is one such school only a comparatively few miles from Red Lake, and fifteen miles from the nearest railroad. In dozens of villages in that state the schoolhouse is the only building in town that has a water-works system. Such vigorous oversight is given the schools of Minnesota that no school is permitted to erect a consolidated building without having the plans approved by the State Department, and without having an entirely modern building. The requirements for consolidated schools include everything from approving the proposed districts to requiring that every school serve a hot lunch during the winter months. Minnesota can make these regulations because it gives the schools state aid, and thereby has a lever to make them live up to certain definite requirements.

Before any consolidated school can be established in Minnesota, the county superintendent must make a plan showing the territory it is proposed to consolidate, the location of the school and all other available information. The State Department can approve or reject the consolidation. This does away with the possibility of some section being left without a consolidated school when it should be in a consolidation. Twenty-five per cent of the voters of each district that it is proposed to consolidate must petition for the school to the county superintendent. All districts then vote together at an election. If the majority of the votes of all districts are in favor of consolidation, the question carries. That means that one section cannot hang back and so defeat a good school which is favored by nearly everybody else. However, the interests of the individual districts are safeguarded by the fact that 25 per cent of the voters in every district must have previously petitioned for the consolidation.

Lessons From Experience

On the occasion of my visit to Minnesota, I asked an official of the state department there to give some good advice from that state's experience with consolidated schools. As a general thing, the state department does not believe that a consolidated school should be established with less than 100 pupils. The consolidated schools over the state average about 150 pupils. It is believed that at least four teachers should be employed for the grades and two for the high school, and that is almost impossible with fewer than 100 pupils. Of course, there are cases where communities may be isolated, where it is impossible to have 100 pupils, and in such cases, the proposed school may be approved.

As a general thing, the state department fa-

vors a two-story brick building. Three-story buildings are frowned upon. A requirement in a consolidated school is that every school must have an auditorium. Of course, in some of the smaller schools two classrooms may be arranged so they may be opened to form an auditorium, but the larger buildings usually have the auditorium entirely separate. Every building must be entirely

One of the Finest Country Schools in the United States, near Minneapolis

modern with the right kind of light, modern toilets, ventilation, steam heat, and drinking fountains on every floor.

It is interesting to note that each consolidated school receives yearly from the state \$2,000 with which to transport pupils and three-fourths of such an amount beyond \$2,000 as is expended for transportation.

No school, however, can receive more than \$4,000 from the state for transportation expense. It will be seen that one of the arguments against consolidation is done away with in Minnesota, because the state gives a great deal of money outright for transporting pupils. In addition, each school receives \$2,000 when a building is first erected. Truly, it may be said that probably no state in the Union has done more for the consolidated school than has Minnesota.

As a general rule, thirty sections are regarded as a reasonable area for a consolidation and the buses should not be required to haul any children any farther than five miles. Twelve sections are the minimum for consolidation except where a town is included. Generally, some logical center for a school is selected. It may be near a country store or creamery, or anywhere that people are accustomed to meet. If a village is within reasonable distance of most of the pupils, it is so much the better.

Perhaps one of the finest buildings for a consolidated school is the one known as the Bloom-

ington School about six miles from Minneapolis. It was erected two years ago at a cost of \$100,000 and is located right out in the open country on a site of eighteen acres. There are a few stores and houses at a cross-roads nearby, but they do not even constitute a post office. The building is a two-story brick of fireproof construction, 222 feet long and 53 feet wide. At each end of the building there is a one-story wing, one of them being taken up with an auditorium and the other with a science laboratory and a manual training room. The country surrounding the school is a very prosperous farming community, such as is found near any big city, and the farms are probably smaller than the average. The district comprises twenty-two sections. Five

old schoolhouses were discarded and now no one would think of going back to the old plan. The school has around 200 pupils and it has been made large enough to accommodate a much larger number as the community grows. In fact, it is generally the experience that a consolidated school increases the number of school children in the community. Many who have never thought of attending high school readily change their minds when they have a good building right at hand.

A person who is accustomed to only the little one-room schoolhouse would be astonished at the character of this building. In fact, it puts to shame most of the school buildings in ordinary cities. The school has a double system of heating, the same as most of the larger buildings in Minnesota. This includes the ordinary steam radiators and also the vacuum system. The latter is built on the most approved lines, the air being brought into the basement, washed by being forced thru tiny jets of water, and heated by steam coils and then forced into the rooms. In ordinary weather, this system alone is used, but in very cold weather it can be reinforced by using the radiators also. At each end of the building there is an electric motor which pumps the foul air out of the building. The temperatures in the individual rooms are controlled by thermostats. The school has its own water system of course, but electricity is secured from a transmission line out of Minneapolis. There is a vacuum cleaning plant in the basement with connections throughout the building so that all the dirt can be sucked down into the basement. Gas for operating the stoves in the domestic science room is piped from a tank outside of the building. In fact, there is nothing missing to make a completely equipped school.

Both upstairs and down are wide hallways between the various rooms opening off at the sides. At one end of the main floor is a combined gymnasium and auditorium. At this end of the building there is an entrance to a small box office window at the door. This part of the building is entirely separate from the rest of the school, altho there are doors also opening into the main hallway on the lower floor. Farmers' meetings may thus be held without interfering at all with the work of the school.

In the one-story section of the building at the opposite end are located the manual training shops and science laboratories. There is also a conservatory opening out of this end of the building with glass on three sides. Here agricultural experiments are carried on during the cold weather. On either side of the main hallway are the grade schoolrooms. Upstairs there is a fine study hall for the high school, besides recitation and classrooms. There is also a suite of rooms for the domestic science department and a teachers' rest room which is also used for taking care of any of the children that become sick at school. The eighteen acres afford plenty of room for agricultural experiments, an athletic field and

playground.

Schools in Cut-over Lands

Many schools equal to the one I have just described can be found in the rural sections of Minnesota. But lest the reader might be of the opinion that I am describing schools existing under unusually favorable conditions, we shall take a little trip to the northern part of the state and see how the schools fare in the more sparsely settled sections. A day's journey brings us to the lake country of Minnesota, about 200 miles northwest of Minneapolis. This is a great country for tourists in the summer, but by late fall most of them have journeyed to warmer climates.

(Continued on Page 11).

A Less Elaborate Consolidated School in Renville County, North Dakota

ington School about six miles from Minneapolis. It was erected two years ago at a cost of \$100,000 and is located right out in the open country on a site of eighteen acres. There are a few stores and houses at a cross-roads nearby, but they do not even constitute a post office. The building is a two-story brick of fireproof construction, 222 feet long and 53 feet wide. At each end of the building there is a one-story wing, one of them being taken up with an auditorium and the other with a science laboratory and a manual training room. The country surrounding the school is a very prosperous farming community, such as is found near any big city, and the farms are probably smaller than the average. The district comprises twenty-two sections. Five

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

Growing Alfalfa

Please give me some information in regards to alfalfa growing. I have a field of four acres which is in sod at present. Will plow it this spring. When would you advise to sow, and how much to the acre? There are wire worms in this field. What fertilizer would you advise?—A. B. S. Lancaster Co., Pa.

Successful growing of alfalfa calls for the scrupulous consideration of the following points:

1. Alfalfa will not succeed on land that is not well drained.
2. The soil must be well supplied with lime.
3. Available phosphoric acid must be furnished and on sandy and gravelly soils also potash.
4. The seed bed should be carefully prepared in order that the weed seeds may be sprouted and destroyed and a good tilth secured.

Particular attention should be paid to the source of the alfalfa seed. Preference should be given to seed grown in Kansas, Montana, Idaho or Utah.

The seed or soil should be inoculated with bacteria that will produce nodules on alfalfa roots.

Under your conditions the land should be plowed as early as possible this spring. The crop to be grown may consist of oats or oats and Canada field peas for forage purposes, or early potatoes if your land is suitable for potatoes. Any of these crops would do to precede alfalfa. After the oats and Canada field peas are harvested in July the land should be plowed at once and summer fallowed until about the middle of August. Lime should then be broadcasted and harrowed in. For heavy land burned and slaked lime equivalent to 2000 to 2500 pounds of freshly burned lime per acre should be used. For medium and lighter soils ground limestone at the rate of two tons per acre would be preferable. After the lime is thoroughly worked into the soil acid phosphate at the rate of 300 to 500 pounds per acre should be applied. For gravelly soils or for sandy loams the addition of 50 to 100 pounds of muriate of potash per acre would also be desirable. The alfalfa seed should be sown at the rate of about 25 pounds per acre. A wheelbarrow seeder is most commonly used for sowing alfalfa. One-

half of the seed is sown in one direction and the other half in the other direction, so as to secure the best distribution.

Prior to sowing the seed it should be inoculated either with a commercial culture of alfalfa bacteria or with liquid obtained by stirring alfalfa soil in a barrel partly filled with water and then mixing the seed with this liquid, drying it and sowing. If soil from an alfalfa field in the neighborhood is available, it may be broadcasted and harrowed in at the rate of 300 to 500 pounds per acre. The soil from well established alfalfa fields, as is well known contains the alfalfa bacteria, and the land may therefore be inoculated by broadcasting alfalfa soil. Where this is not available, commercial cultures may be used as suggested. Directions for using such cultures are found on the containers in which they are sold.

By following this procedure and working the land carefully during the interval between the harvesting of the oats and the sowing of the alfalfa between August 15th and 20th, weeds and troublesome insects may be, to a large extent, eliminated, and enough nitrates accumulated in the soil to help give the young alfalfa plants a good start.

Planting Potatoes on Clover Sod

I have ten acres of clover sod which I want to plant to potatoes this spring. Am planning on letting the clover grow until about June first so

as to have a heavy growth to plow under. Will it be better for me to plow under the standing clover or to cut it first, let it cure, and then plow it under? Why does soil turn sour when clover is turned under without cutting it first?—E. P. D., Carbon County, Pa.

The possible advantage from allowing the clover to grow until early June would be the accumulation of a greater amount of humus and of nitrogen. The difference in so far as nitrogen is concerned is not as great as it may seem, for the clover accumulates a large proportion of its nitrogen while it is still young. In other words, clover two weeks before blossoming is relatively richer in nitrogen than at blossoming time, while at blossoming time it is relatively richer than it is two weeks after blossoming. Hence, from the standpoint of increasing the supply of nitrogen in the soil, the difference from plowing under the crop May 20th to June 1st would not be as great as it may seem. On the other hand, where the clover is allowed to grow until the 8th or 10th of June, the soil may not be in as good condition, especially in a dry season, as it would be when plowed earlier in the season. All told, it would be to your advantage to plow the clover before the end of May. If possible, a light coat of manure should be spread on the clover before it is plowed under.

It is probable that green clover, or any other green crop, when plowed under will temporarily sour the soil. This sourness, as shown by actual tests, disappears in a relatively short time. It would be safe to plant the potatoes within a week after a heavy crop of green clover is plowed under. If the stand of clover is light or when the plants are small, the potato crop might be planted within three or four days after the clover is plowed under and the land carefully prepared for planting. When the clover is cut and then allowed to cure before it is plowed under, the amount of acid temporarily accumulated in the soil will not

Farm of I. W. Wilson, Huntingdon County, Pennsylvania

be as great. It is probable that the best results would be obtained by you if you broadcast three or four tons of well-rotted manure per acre on the clover toward the end of May, plow your field and thoroughly fit it. Commercial fertilizer, containing about 3 per cent of ammonia, 10 per cent of phosphoric acid and 3 to 5 per cent of potash, should then be applied at the rate of about 1000 pounds per acre. By following this method you will be certain in any ordinary season of a good crop of potatoes.

Marl Versus Burned Lime

In a fertilizer mixture for general crops how does 20 to 23 per cent double manure salts at \$2.50 per 100 pounds compare in value to muriate of potash at \$6.00 per 100 pounds? On a basis of \$10.00 delivered at railway station how does marl lime compare with other lime? Some claim that marl is superior to burned lime and safer to use, especially on wheat and grass. What would you advise for soiling in oats? I had intended using alskike and red clover but my land is rather deficient in lime.—Pennsylvania Subscriber.

If the potash salts referred to are to be used in mixtures for general farm crops, the double manure salts would be fully as satisfactory in their action as the muriate of potash. At the prices quoted the double manure salts will give you the potash at a somewhat lower figure than will the muriate. You will have other salts in

the former that would cost you nothing. Hence, for grass and corn preference would, without question, be given to the double manure salts at the price quoted except insofar as you may have a long haul from your freight station and the cost of hauling and handling would more than offset the somewhat lower price.

Marl lime delivered at \$10 per ton is relatively expensive as compared with other forms of lime. Marl lime of good quality contains about 50 per cent of actual lime, or about the same as is contained in raw ground limestone of good quality. There is a considerable range in the prices quoted on ground limestone. For instance, a Syracuse, N. Y., company quotes \$2.75 per ton bulk f. o. b. its plant. A Michigan company quotes \$4 per ton f. o. b. Buffalo, N. Y. A New Jersey company quotes \$4.50 per ton and a Philadelphia firm quotes \$3.50 per ton f. o. b. its plant. These figures, taken at random, will show that ground limestone, with freight rates included, would cost less than marl lime at \$10 per ton delivered. It is to be remembered that freshly burned lime or lump lime will contain 90 to 95 per cent of actual lime and hydrated lime will contain from 55 up to 75 per cent of actual lime. As to the action on grass when equivalent amounts are used, there is not ordinarily much difference observed from different applications of different kinds of lime. The only exception to be noted in this case is burned or slaked lime derived from magnesium limestone. Where large amounts of such burned and slaked lime are used damage may be done to crops. On the other hand, marl lime or ground limestone may be used in very large amounts without any danger of injury.

Alskike clover will stand a greater degree of acidity in the soil than will red clover. The latter will stand more acidity than alfalfa. If your soil is badly in need of lime, even alskike might not thrive. However, it would be safer to use than either red clover or alfalfa. If lime can be used before the oats are sown, it may pay to employ a mixture of alfalfa, alskike and red clover.

Salt on Certain Soils

In your issue of Feb. 26, 1921, Dr. Lipman had an article on the value of salt on land. I would like to have him advise how much to use on the different kinds of soil—clay, clay loam, gravelly loam and sandy loam. I want to use salt to kill Canada thistles and quack grass. What can be done to the soil to make it productive again?—T. M. R. Armstrong Co., Pa.

The heavier soils will stand more salt without injury, while the lighter soils will show the injurious effect from large applications of salt more quickly. On the other hand, the excess of salt is more readily washed out of sandy soils than it is from the heavier soils. Ordinarily, applications of salt at the rate of 150 to 200 pounds per acre in the case of grass, corn, etc., will be the maximum. Even these amounts might cause damage if applied in the row. However, when thoroughly broadcasted, 150 pounds of common salt per acre may be used on the heavier soils with benefit to the grass and to other crops where the land shows response to applications of potash. It should be remembered that land which responds to applications of potash could be made to yield up a large quantity of available potash to the crop when moderate amounts of common salt are used.

Where salt is used for the purpose of exterminating weeds and soil-infesting insects, relatively large amounts will have to be employed. For sandy soils as little as 2000 to 2500 pounds per acre may prove to be sufficient. For heavier soils amounts up to three tons per acre may be used to destroy Canada thistle, quack grass, wire worms, etc. With applications of salt as large as those given the land will remain unproductive for several years, for it will take some time to wash out the excess of salt and to restore the texture, which is more or less injuriously affected when large quantities of salt are used on clay soils and clay loams. Deep plowing, the addition of manure and thorough tillage will offset the injurious effect of the salt.—J. G. Lipman.

Home Warmth Guaranteed by HOMAKER—the Better Pipeless Furnace

WARMTH. Every room heated alike, every room cozy comfortable! Warmth, evenly controlled in all weathers, ample on coldest days—unfailing, steady, perfect—in new homes or old.

That is the HOMAKER guarantee.

And yet warmth is but the beginning of what this simple one-register heating plant brings you. That proud title, The **Better** Pipeless Furnace, was earned by the many vital improvements in HOMAKER'S design and structure that make for better health, greater economy and increased comfort.

By eliminating dust and dirt, HOMAKER keeps the air pure as well as warm. The handy shaker handle and wide ash pit doors are examples of added conveniences. The prevention of heat waste brings remarkable fuel economy. And the entire sturdy construction means freedom from breakage or burning out.

HOMAKER

"HOME-MAKER"
PIPELESS FURNACE

You shake and dump HOMAKER from an easy upright position *with all its doors closed tight*. No trace of ash dust can escape. Edge-dump grate gets rid of ashes and saves live coals. Outer casing and register both oversize; heat-radiating castings are centered; abrupt air passage angles eliminated. This combination effects freer warm air circulation. HOMAKER need never be *forced*. Quadruple casing, inner one with a heavy insulation of air-cell asbestos between the two sheets of steel. All the heat conserved for upstairs, where it warms every room evenly; none wasted in the cellar. Cast smoke collar runs clear through all casings. No gas can leak out. Full width ash door. No hard-to-clean corners in the ash pit.

Send the coupon today for our free book "The Story of HOMAKER." It explains in detail HOMAKER'S many vitally important improvements.

The Ralston-Nolan Land Tax Bill

(Continued from Page One).

of our natural resources which are frequently alleged to be under monopolistic control. It seeks to prevent speculation in land values. The bill makes no distinction between idle land and that in use. Indeed one of its avowed objects is to tax idle natural resources and productive land held out of cultivation and thus to force it into use. Such a tax would also discourage large holdings in favor of the smaller. Such forms of taxation are not new to the American farmer nor is he as hostile to such proposals as is frequently alleged. The Farmers' National Congress at its annual convention in Indianapolis in October of 1916 adopted the following: "Resolved that this Congress view with alarm the increase in farm tenancy, recommends that the several states adopt a gradual land tax adapted to their peculiar conditions in order to promote more and better farm homes, farm citizenship and country life in general." The National Grange at its annual convention in Washington endorsed the so-called Crosser Bill, introduced before a former session of Congress with somewhat similar aims. The Farmers' Non-Partisan League of North Dakota, which elected a Single Tax Governor, had a land value tax in its platform.

There are certain economic principles contained in the Ralston-Nolan Bill which require examination. In the first place a tax on land values is a direct tax. A tax upon economic rent cannot be shifted. It is the opinion of most economists that such a tax cannot be passed on to the tenant, nor can its final burden rest upon the consumer in the form of higher food prices. Rent in its economic sense is due to the superior productivity or location of various pieces of land. If one acre of ground equally accessible to markets will produce with the same amount of labor and capital an average yield of ten dollars' worth more of potatoes than another acre of land it will yield ten dollars more in rent to its owner. If the rents paid for different pieces of land afford an accurate measure of their varying degrees of productivity the tenant is already paying what the land is worth. He cannot and will not pay more rent because of the new tax, provided there is no change in the value of his land due to other economic conditions. A general attempt to shift the tax in the form of higher rents will bring poorer sites and hitherto uncultivated land into operation. They tend to fix prices of commodities, for rent due to superior qualities of certain pieces of land is in the nature of a surplus going to the fortunate owners. Unless there is some other economic cause a tax upon land values cannot be shifted by the owner to the renter or to the consumer in the form of higher food prices.

If a tax upon land values is permanent it cannot be shifted to the next purchaser, because he will discount the value of the property by the value of the tax. Suppose a piece of farm land to be yielding a rent of six thousand dollars. Capitalized at six per cent its value would be one hundred thousand dollars. If a one per cent tax is placed upon it this would be one thousand dollars a year. The rent must remain six thousand dollars, for we have attempted to show that a tax on land value cannot raise rent. The yearly

income from this piece of land is now only five thousand dollars (six thousand and rent, minus one thousand dollars tax). Capitalizing his now diminished income of five thousand dollars at the same rate of six per cent the investment value of the same farm is but eighty-three and a third thousand dollars. No future buyer will pay more than that sum because of the new tax. By becoming a silent partner to the extent of one per cent in all the future earnings of the given piece of land the government at one stroke has taken sixteen and two-thirds thousand dollars from its investment value.

It may be asked if this does not amount to something like confiscation. The answer depends upon one's theory of taxation. Of these theories there are many, as for example, the ability-to-pay theory, of which the income tax is supposed to be an illustration. Another is special privilege theory, by which an individual should contribute to society in proportion to the special privileges he enjoys. Is the ownership of land and other natural resources a special privilege? Single taxers reaffirm that "the earth is the Lord's and the fulness thereof." They lament the appropriation of large tracts of land and the seizure of especially valuable natural resource by private individuals. The owners should at least contribute in taxes in proportion to their ownership of those natural resources such as land, which rightfully belong to society in general. Thus, a tax upon land values is defended by the so-called special privilege theory of taxation. Whether just or unjust, however, society has given its assent for centuries to the private ownership of land. An individual with one hundred thousand dollars invested in a piece of unimproved land would find sixteen and two-thirds thousand dollars sliced off the value of his investment by such a tax on land values as the proposed Ralston-Nolan Bill. A similar sum invested in a mortgage would be untouched by that law. It must be remembered, however, that there are other laws which have precisely the same effect upon the value of securities. The income tax has sliced similarly the investment values of stocks and bonds to most owners. In some cases the surtaxes by taking a greater proportion of the income have reduced the investment value of securities to a far greater extent.

The Ralston-Nolan Bill proposes to tax all unimproved land values whether agricultural or not. Our same line of economic reasoning applies to coal and mineral lands as well as to farm land. It is the same principle of economic rent—the superior values of different pieces of land whether useful in producing potatoes or coal. In general such a tax cannot be shifted. Suppose, however, a monopoly exists. Cannot the consumer be made to pay a higher price for the product? A monopoly presumes such a control over supply as to permit price fixing. A monopoly fixes its price at that point where the profit is greatest. This is frequently, but not necessarily a high price. Experience may have shown that a higher price means fewer sales and that higher profits may come with more sales at a lower price. If with more sales a monopoly price is probably already fixed at that point at which the profit is the greatest. If such is the case it will be a loss to the monopoly to try to raise the

FARQUHAR

The Farquhar principle of separation ever insures clean fast threshing. We have manufactured Threshers for nearly 60 years, and our present modern line has been developed by continuous field experience.

Rake Separator shown here is a most practical and economical machine for the farmer who does his own threshing. Made in two sizes with capacities from 350 to 600 bushels of wheat a day. Suitable for Gas Engines 7 H. P. and larger.

Our Vibrator with Self Feeder, Wind Stack, etc., is suitable for large crops and merchant threshing. Improvements giving increased separating and cleaning facilities added this year.

We also make a special Thresher for Peas and Beans, and a Peanut Picker.

Farquhar Threshers are best operated by Farquhar Steam and Gas Portable and Traction Engines. Illustrated Thresher and Power Catalogs sent free on request.

We also manufacture Sawmills, Potato Diggers, Grain Drills, Hydraulic Presses, etc. Write us concerning your requirements.

A. B. FARQUHAR CO., Ltd.
Box 546 York, Pa.

THRESHES CLEAN

WORKS LIKE A HOE

Covers 8 Acres a Day

It does as good work as you can do with a hoe—its cuts every weed—None can dodge it—Keeps the surface in condition to readily absorb rain and produces a mulch of fine soil which prevents the escape of moisture. One trip to the row—narrow or wide.

With one horse the Fowler does as much work as you can do with a two-horse cultivator—and better work—because it cultivates shallow, and has no need to destroy crop roots. By removing plow foot you can cultivate astride the row. Can also be adjusted to cultivate crops planted either above or below the level without destroying the loving sides of the ridges.

It's the cultivator for corn, cotton, tobacco, peanuts, beans and truck crops. It is unequalled also as a bean harvester.

Carried in carload lots at leading distributing points.

Write today for catalog which fully explains The Fowler—It's Free!

price, for the sales will be decreased and profits will fall off. Hence a tax upon monopoly profits cannot be shifted. Moreover, a tax upon land values would tend to make it unprofitable to keep productive land idle. By bringing it into use monopoly control might even be broken. An increased supply of products resulting from the use of hitherto uncultivated land would tend to bring down the prices of the products.

A great English economist, Mr. J. A. Hobson, in his recent book, "Taxation in the New State," has recast the whole philosophy of taxation. He tries to analyze more closely the so-called ability to pay. Mr. Hobson would draw a line between costs of production, which are incapable of bearing taxation and "surplus" wealth, out of which all taxes must eventually come. Under "surplus" wealth he would include among other things excessive or monopoly profits, inherited wealth and economic rent, which we have seen is based upon unimproved land values.

A tax which bears upon the cost of production is either immediately shifted or else curtails production, raises prices and is finally shifted. Many of our war taxes which bore upon industry hit the cost of production and hence were shifted. The final burden was frequently hard to trace in its devious course, but it sometimes gathered in size like the proverbial snow ball. A tax upon commodities is the classic illustration of an indirect tax shifted to consumers. During the war everything in sight was taxed from silk shirts to spectacles. Part of the agitation today over the revision of taxes is due to the failure to study the location of the final burden of the various taxes imposed. The principle of taxation during the war was that of the drunken Irishman at the country fair, "Every time you see a head hit it." The only defense of such a system is that money was raised in a quick way to help win the war. Now that the conflict is over it is surely time, to paraphrase the words of the walrus, to stop talking in incoherent terms of "ships and shoes and sealing wax, of cabbages and kings." The entire theory of taxation must be reviewed and some guiding principles adopted. Thus a tax must be proportionate to one's ability to pay and we must know where the final burden rests if we expect to escape the pernicious shifting of taxes. The Ralston-Nolan Bill will place its burden upon the large holders of land and natural resources. It will be unfair if it taxes one form of wealth, namely land values, out of proportion to other forms of wealth equally capable of bearing taxation. The social effects will be beneficial in so far as speculation in land is discouraged and idle land is brought under cultivation. The bill may tap monopoly profits, but it is sure in any case to raise an enormous revenue to help defray our war debts.

LOOSE BUSINESS

A county in an eastern state recently furnished a fine example of how not to do business. The purchasing agent for the Farm Bureau got a car of lime without having his commission fixed. Disputes arose and it required care to make satisfactory adjustments.

Moral: All matters of commission should be settled in advance.

Economy makes happy homes and sound Nations.—George Washington.

Your Implements and Your Credit

THE farmer, like the manufacturer, must frequently turn to the banker for credit in order that his production may go on.

In extending credit to the manufacturer, the banker takes account of the plants and their equipment, of the condition of the machinery used.

But most of all he takes account of the organization, reputation and good will—the value of the trade-name.

He knows that when he finds these things he can more safely advance the funds that every business man requires from time to time.

Your equipment and your methods influence the banker in the same way. When you

use farm implements that bear so well-known and dependable a trade-mark as E-B, you are increasing your credit standing.

Your banker will be more disposed to aid you where and when he can. He knows of the long life and satisfactory service which E-B implements give, and he appreciates the importance of your being able to obtain repairs promptly through E-B branches and dealers.

His sound business judgment sanctions your choice of E-B tools.

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.

—The Editors

In the battle of life we cannot hire a substitute.

Study The Tax Bill

WE HOPE everyone interested in the subject of Federal taxes will read the article published on the first page of this issue. Without doubt the Nolan-Ralston Bill will come up for consideration at the special session of Congress next month. The article referred to was prepared at our request by a professor of economics and is without bias or intent to spread propaganda. Pennsylvania Farmer did not join in the general condemnation of the bill when it was first introduced, and after careful consideration we are inclined to approve of its general purpose, which is to tax large holdings of land. Many farmers have been misled by opponents of the measure into thinking that it is a scheme to further increase the farmers' taxes. A reading of the bill in the light of facts shows that not more than 10 per cent of the farmers of the United States would be affected. It provides a tax of one per cent upon land values in excess of \$10,000, exclusive of buildings and improvements. For example, if a farm was assessed at \$15,000 and the buildings were valued at \$5,000 or more, the owner would pay no tax. Or, if a farm was assessed at \$20,000 and the buildings and improvements were worth say, \$6,500 the owner would pay tax on \$3,500. It is estimated that the law would furnish \$80,000,000 in taxes, collected almost entirely from others than Simou-pure farmers.

Increase The Revenues

WHEN a man in private business plans to increase his expenses he also provides for increasing his income if he is really a business man, and especially if he has been spending all his income in the past. Legislative bodies do not seem to be governed by this fundamental business principle. The Legislature of Pennsylvania is actuated by the most generous impulses concerning appropriations, but when it comes to providing means of raising more revenue it experiences a nervous chill, especially if the plans proposed involve increased tax upon corporations and big property holders. Just now it appears that the state will find itself short of the estimated revenue by millions of dollars, yet the business of appropriating to the institutions "back home" goes merrily on and there seems to be little prospect that bills for taxing coal and other sources of wealth will receive serious consideration. Senator Penrose has declared against additional taxation and he knows what the big interests want and don't want. Governor Sprout

Pennsylvania Farmer

suggested several sources of increased revenue, none of which would be burdensome to business or to the public, and which would be a step in the direction of equalizing taxation. The suggestions did not meet the approval of those affected and he has not seen fit to urge the plan by administrative pressure. As a result of the lack of funds, roads, schools, agriculture and other state institutions and enterprises are likely to suffer unless the people bring enough pressure to bear upon their legislators to force them to pass the bill which would put additional taxes upon the wealth named above. Joseph E. Phillips, representative from Clearfield County introduced a bill to this end last week.

The Interest Rate

A STRONG effort is being made the country over to have the legal rate of interest raised and several bills to this end have been introduced into the Legislature at Harrisburg. The plea is made that the present rate is too low to attract investment in new enterprises or to properly finance existing business; that the demand for money in some lines able to pay a premium is great enough to cause a shortage in other and vital industries. These measures are approved by a large class who, depending upon their incomes from investment, found them inadequate during the war-time period of high prices, and of course those whose business it is to lend money favor a boost in the legal rate of interest.

One or two of the bills would not seriously affect the average citizen, at least not directly. One would permit corporations to go into the open market and obtain money at the prevailing rate when they wished to float a loan. This bill has passed the House and is now in the Senate. There are two other bills which would definitely fix the legal rate of interest at 8 per cent. The people of the state should protest vehemently against the passage of either of these measures. The war-time conditions are passed and whatever consistency there might have been for increased interest rates during the period of inflation these reasons no longer obtain. Wages, incomes and profits are gradually and certainly settling to lower levels and it would be ruinous to the majority of people and industries to have a war-time rate of interest fastened permanently upon them in normal times. Even tho the law would not be retroactive in operation, mortgagors would find that their mortgages would be called in and new ones demanded at the higher rate. Tens of thousands of people would likely lose their homes, since many were bought at inflated prices, and with the owner's decreased income, interest and payments could not be made.

State College's Need

IF ALL the people of Pennsylvania could be made fully acquainted with the work and achievements of their State College, and at the same time understand the hampered conditions and the limitations under which it labors due to lack of funds we believe the Legislature would feel under obligation to appropriate the money that is asked. As an illustration the editor will give example of the needs which came under his eyes during a visit to the College last month: One of the main stock barns is located on what is called the West Farm, being west of the campus and at the extreme west side of the property. The original owner of the farm located the barn and sheds in the lowest spot on the farm. The water during a rainy time drains naturally and unavoidably into the basin where the buildings are situated. The writer's last visit was during a wet spell and the entire surroundings were shoe-top deep with mud and water. A valuable, highly bred calf was ill with pneumonia and Prof. Tomhave says that they have losses from this cause every year. Steers were standing or walking around in mire and best results from experimental work cannot be secured. Every effort is made to obviate the effects of this condition but it is a physical impossibility to remedy them at this barn.

One of the items repeated in the budget this year is a sum to build a suitable stock barn adjacent to the other stock barns on the East side. This would provide an ideal situation and at the same time avoid the costly necessity of hauling

all feed, bedding and produce across the property as is now the case.

The expenses of conducting the College have increased as they have in every other business. The appropriation made two years ago was insufficient to cover the actual cost without cutting and trimming, and delaying many necessary repairs. With the increased cost of fixed expenses considered it will be necessary to provide a minimum increase equal to 70 per cent of over that of two years ago even to continue the present curtailed activities. But that is not all, nor is it sufficient. At present a large number of classrooms are crowded beyond the proper number for effective instruction; a number of class rooms and laboratories are located in poorly lighted and improperly heated basements and attics; in some laboratories two and sometimes three students are compelled to work at single desks; in some instances single rooms house two different classes at a time; in many cases laboratories are scheduled for so many hours per day as to prevent adequate preparation of laboratory materials for successive classes; some laboratory courses have had to be cancelled for lack of space. Office quarters are so congested that in many departments from four to ten workers are located in single small rooms. The number of women students who can be admitted to the College has reached a maximum until more dormitory facilities are provided.

Every far-seeing farmer and every believer in higher education should use his or her influence with their legislators to deal generously with State College in matters of appropriations, remembering that it is the only college in the state which has no endowment, charges no tuition, but which has many costly obligations placed upon it by law.

Our Washington Letter

Secretary of Agriculture Wallace is speedily getting "into harness" in the Department of Agriculture, and is making a favorable impression. Representative farmers who call upon him at his office are given a genuine Western welcome, and go away firmly convinced that Secretary Wallace aims to keep in close touch with the sentiment and needs of the farm folks, and is in no danger of losing the farmers' viewpoint in dealing with great agricultural problems.

At a conference with the Washington newspaper men and farm paper correspondents, Secretary Wallace issued a statement in which he clearly outlined the agricultural situation, pointing out the causes of the present depressed condition of the farmers and promising that under his administration the department would do all within its power to give practical assistance to farmers. Finding an outlet for the great food surplus, searching for ways to produce more cheaply, trying to find new uses for farm products, developing a more efficient marketing system, straightening curves and lowering the grades between the producer and the consumer are some of the activities in which the department should engage, according to Secretary Wallace.

The Secretary gave as his opinion that greater interest would develop in eastern farming because of the higher freight rates, which increase the cost of putting the products of Western farms upon the large eastern seaboard markets.

Cheap food is evidently one of the means which the great industrial interests are preparing to use in their efforts to compete with European manufacturers in the world's markets. Cheap food means low wages, an important essential in meeting European competition. In order to get this cheap food a movement will be promoted to locate immigrants on small farms with the aid of the Farm Loan act.

Commissioner of Internal Revenue William M. Williams has as yet made no announcement of any change in the so-called adulterated butter ruling of the Treasury which is to go into effect on April 1. It is probable that the butter interest, especially the creamery men, will ask for an injunction to prevent the putting of the ruling into effect. The ruling will be stubbornly contested in the courts.

The Washington representatives of the farm organizations have at last arrived at a practical realization of the fact that the only way by which they can accomplish desired results in promoting or preventing legislation is to get together, and leave their personal disagreements and organizational differences behind when they make their appearance on Capitol Hill. They have suggested to the heads of their organizations that they call a meeting of their executive committees in Washington early in April, to jointly formulate a legislative program upon which they all can agree, and which can be presented to Congress as the united voice of agriculture.

March 26, 1921.

March 26, 1921.

HARRISBURG LETTER

Revenue Problem Unsolved.—The Legislature began its final six weeks today without a revenue policy; appropriations piling up at every session of the two houses; official estimates of the revenues not yet submitted and a disposition on the part of officials and lawmakers to "pass the buck." The record of accomplishment for the session thus far is surprising in view of the time and money spent on the session and about all there is to show for it is (ons of printing, most of which will be rather poor satisfaction to the men to take home in place of sizable appropriations. Members of the House made an effort in the week just closed to point the way to getting revenue from new sources after having found the State Administration firm in its refusal to sponsor any revenue legislation, but were just as shy as the Governor or the chairmen of the appropriations committees in urging that the state payroll be cut and the allowances to charities not under state control be cut. It seems odd that so manifest an opportunity for real economy should be passed up at a time when complaint against governmental expense was general. But it is like a good many other things that have occurred on Capitol Hill. Some times it takes an earthquake or a cyclone to wake people up.

The Educational Jam.—Just at present it appears the educational bills, which provide not only increased salaries for teachers, but aid for fourth class districts so that they can improve facilities and give the youngsters a chance and regulate qualifications of teachers, are like logs which have been caught in a jam. They cannot move until the revenue proposition is started off.

The State Fair Bill.—The State Fair bill is to be given a hearing before the House appropriations committee this week and the fight against it will come to a climax. The bill got out of committee last week, but is scheduled to go back. The small fair people are up in arms against it and the large fair people are insistent that the project so strongly advocated shall not be created to interfere with their business.

State College Appropriation.—The question of how much money State College will get will be settled soon. The situation is that the three big colleges are all after much money, millions more than can be voted, and in the absence of a revenue policy it would seem that the appropriations are mighty uncertain. That this should be the case after all the discussion of higher educational work and agricultural advancement is rather regretted in Harrisburg.

Ask an Accounting.—The House of Representatives has asked an accounting of what the state spent for welfare and defense during and after the war. Something like \$2,500,000 was voted for this purpose and the request for tangible results bids fair to prove interesting.

Seed Bill on the Way.—The administration pure seed bill which would require that mixtures be true to label and that origin and germinating quality be printed on its way thru the Legislature. Presented last Monday by Chairman C. G. Jordan, of the agricultural committee, it was promptly reported and bids fair to supplant the present law. The bill not only defines seeds of an agricultural character, but specifies what shall be considered noxious. Wide authority for inspection is conferred.—Hamilton, Harrisburg.

NEW YORK LETTER

Breeders Plan for Fair.—Tompkins county Holstein breeders are planning a big county exhibit of stock at the coming State Fair. It is announced that after this only tuberculosis tested animals will be allowed at the fair. This gives breeders a stimulus, as many have feared infection to their stock if shown by the side of untested cattle.

Spring Sales Enthusiastic.—Holstein breeders are planning some of the highest sales of purebreds ever held for late this month and next. The famous Oneida community herd of 180 head will be sold April 12 and 13 and replaced with grade stock,

while about 300 head will be sold next week at the Syracuse Sales Pavilion. These are all choice, tuberculin tested animals.

Potatoes Looking Up.—The heavy toll taken by rot in cellar storage potatoes, together with increased consumption has created a scarcity of potatoes on the market despite the big crop in the fall. Local buyers are offering as high as 75 cents a bushel and it is expected the price will go higher. Potato growers of Cayuga County have decided to organize several market potato associations in the county.

Milk War Ends.—The price war on retail milk prices in Auburn is ended, with both stores and delivery wagons to charge 12 cents a quart. It seems an unjust basis of agreement for stores to be obliged to charge as much as it delivered.

State Censorship Sentiment Grows.—Women's organizations and other civic bodies are creating a strong public sentiment in favor of strict censorship of motion picture films.

Wage Cuts to R. R. Employees.—Leading railroads of the state announce a wage cut to employees. They show freight traffic to be at its lowest ebb, with slight outlook for increase. Labor costs are the biggest factor in railroad expense. Carload shipments have fallen off over 50 per cent.

Back to the Farms.—A nationwide real estate firm with offices in New York announces a decided exodus of city people to the farms, both as buyers of farms and as laborers. For the past 20 years two-thirds of this firm's customers have been farmers moving from one state to another, and one-third was composed of city men going to the farms. They find these figures now reversed. In New England this latter movement has increased 200 per cent. Many of these are believed to be men who have formerly had farming experience.

Daylight Saving Repealed.—Governor Miller signed the repeal of daylight saving. New York City will shorten its period of daylight saving two months, while other cities will decide for themselves what they will do.

NEW JERSEY NEWS

Legislature Ending.—The One Hundred and Forty-fifth Legislature of New Jersey for the session of 1920 is nearing its end, despite the fact that the Senate did not concur in a House Concurrent Resolution by Majority Leader Rowland, of Camden, for sine die adjournment on March seventeenth.

Damages for Heifer.—The oldest bill passed in the House for the session was one providing for the payment of \$125 to a Hunterdon County farmer for the loss of a heifer, which was blown to pieces after chewing on a stick of dynamite that was laid alongside of a road near the heifer's property while employees of the State Highway Department were building a road.

Pleaded Over Legislation.—Cattle breeders in this state are much pleased over the action of Governor Edwards in signing a bill carrying an appropriation which will make it possible for dairymen to obtain assistance in testing their cows for tuberculosis. J. W. Bartlett, secretary of the Holstein-Friesian Association of New Jersey, has announced that a campaign is being conducted to encourage all members of that organization to place their herds under State and Federal supervision. He also stated that the breeders of Holstein cattle were glad to co-operate with welfare leagues to make this a state free from tuberculosis. Mr. Bartlett added that when herds are tested three times at intervals of six months without a reactor, or twice at intervals of one year, the herds become accredited. Cattle from these farms can be shipped anywhere, as long as they pass a clean test once each year, he declared. Mr. Bartlett also announced that this state will soon be near the top as a clean state, and that during the past two weeks twelve herds in Somerset and Hunterdon counties have been tested, and that several herds in Salem and Cumberland counties are under state supervision and report less than four per cent reactors.—Kelly, Trenton.

Don't buy any fence until you get this book and compare prices. It shows the best way to buy. It shows the best way to buy. It shows the best way to buy. It shows the best way to buy.

Freight Prepaid. I pay the freight and save you 50% to 60%. Over 180 styles. Also Gates, Barb Wire, Write for Bargain Book today. The Brown Fence & Wire Co., Dept. 2121 Cleveland, O.

EASIEST RUNNING MILL MADE

Kelly Duplex Mills require 25% less power, do as much, or more, work as any other mill of equal size. Grind oat corn, shelled corn, oats, wheat, kafir corn, cotton seed, corn in chucks, shelled oats or any kind of grain. For speed and complete grinding the KELLY DUPLEX HAS NO SUPERIOR.

Equally operated. Never choked. 7 sizes. Fully guaranteed. Any power. Especially adapted for gasoline engines. FREE CATALOG. DUPLEX MILL & MFG. CO., Box 337, Springfield, Ohio

W. D. POWERS & CO.

601 W. 33 St., New York City. We are the largest handlers of commission goods in Greater New York. If you have day to day business of communicate with them.

WANTED

Men with Auto who can sell fruit growers. Easy selling. Big pay. MASON D. & C. CO., Hancock, Maryland

Lowe Brothers

Then The Colonel Up And Said:
"Paint Is The Cheapest Thing I Buy"
After Which He Proved It

"He pointed his long, slim finger at me and told me what lumber costs these days. And nails. And labor. Then he showed me how the house I built for \$5000, ten years ago, would cost more than double today."

"Then he told me how I paid every year \$25.00 a thousand for five thousand of life insurance protection, and then put up a holler, because it cost \$25 a thousand invested, to protect my house from 5 to 7 years."

"Figuring at its present value of \$10,000, or what it would cost to build that house, painting costs me only \$12.50 a thousand."

By Jimminy, the Colonel had me. Paint is sure enough the cheapest protection or insurance I buy.

If it's cheapest for me, it's cheapest for you. To which remark, let us add that Lowe Brothers Paint is cheapest of all, because it goes farther and costs less to make it go. Further, more, it has the lastingness.

No. 8

S. L. Allen & Co., Inc.
Box 1202E
Philadelphia

close of the hatching period, which should be about September first in this state.

This method has given reasonably good control of the peach-tree borer in the experiments conducted by the U. S. Department for three seasons. It has not been as safe on young trees as might be desired, however, and neither has the control of the older trees reached 100 per cent in efficiency. Furthermore it is considered doubtful whether such a degree of control can be secured safely by any artificial measures. They have secured as high as 94 per cent of complete control, however, which compares very favorably with the results secured by the ordinary practice of "worming."

In view of all the facts, therefore, the gassing method of combatting the peach-tree borer, with the aid of para-dichlorobenzene, seems to be promising, but but is evidently not yet ready for general recommendation. If tried at all, it should only be done in an experimental way, and on trees which the owner feels that he can afford to lose. Any one desiring further information in regard to the process, can secure it by writing the Secretary of Agriculture, Washington, D. C., requesting a copy of Department Bulletin No. 796, on the "Use of Toxic Gases as a Possible Means of Control of the Peach-tree Borer." In case any trial is made, we shall be glad to learn the results.

Other gases tried by the Department workers included such well known fumigants as carbon bisulfide, carbon tetrachloride, hydrocyanic acid, and naphthalene, but none of them proved to be anywhere near the equal of the para-dichlorobenzene for all kinds of conditions. It is to be hoped that the factors governing its safety can be more fully determined in the near future, so that peach growers can at least add this additional means of defense against the ravages of this very destructive insect.

QUESTION ON SPRAYING

Please give me some information on the following questions:

- (1) What is the value of spelt or emmer as a feed for farm animals? How does it compare with barley?
- (2) Will a hydrometer of the kind used to test storage batteries do to determine the specific gravity of concentrated lime-sulphur? What is meant by degrees Baume? It is not indicated on my hydrometer.
- (3) Will atomic sulphur take the place of lime sulphur, self-boiled, in spraying peach trees for brown rot?—H. E. D., Chester Co., Pa.

In this connection, I would say that emmer and spelt are quite different plants, altho they have been very often confused in this country. According to the principal authorities on feeds and feeding, the comparative feeding value of emmer and barley may be seen from the following:

	N. free	Dig. prot.	Fat.	Fiber.	ext'c.
	p.cent	p.cent	p.cent	p.cent	p.cent
Emmer	10	2.2	11.1	62.9	
Barley	9.4	1.8	4.2	68.7	

(2) A storage battery hydrometer is all right in principle to test lime-sulphur concentrates, but it usually has a scale of too wide a range, with insufficient marking of the degrees of density. You would better get a regular lime-sulphur hydrometer with both specific gravity and Baume scales marked on it. Reliable dealers should be able to supply you.

The Baume scale is simply another

method of measuring the density of liquids in comparison with the density of water. It is divided into degrees, while the specific gravity scale is divided into decimals. The latter is much more convenient in making dilutions, and is almost universally used in all scientific laboratories. The Baume readings usually seem to be a little higher than specific gravity readings of same density, which apparently commends them to the commercial trade. For example, a 31 degree Baume concentrate is just equal in strength to a 1.27 specific gravity concentrate.

(3) Atomic sulphur is intended to be the commercial equivalent of the 8-8-50 self-boiled lime-sulphur, and it usually comes up to this expectation, so far as its efficiency is concerned. It is generally considerably more expensive, however, and we know of some cases where it apparently caused considerable burning to peach foliage.

NEW THINGS IN THE GARDEN

All of us who have home gardens raise in them the usual variety of vegetables. We have beans, both snap and shell, a succession of peas and sugar corn, cucumbers, summer squash, tomatoes, cabbage, lettuce and the root crops such as beets, carrots and turnips. A glance thru the seed catalogs will show other vegetables not so commonly grown, but many of them are certainly of value by way of furnishing a variety for summer and fall use. Many plants, like Chinese cabbage, New Zealand spinach, Swiss chard and kale are of value for "greens." Chinese cabbage is really a sort of summer salad plant. There are several varieties which are not greatly different from each other. We sow the seed the last of July and it may be planted even later. The leaves are ready for use in four or five weeks. Some also enjoy it as a pot herb. It is of easiest culture. Endive is a salad plant that beats all others when properly grown. It should be planted like lettuce the latter part of July. The plant makes heads similar to lettuce. When these are well grown, the leaves should be bunched together and tied for blanching.

Whitloof chicory is so easy to grow that every farm garden ought to raise a supply for winter forcing. The seed sown in drills during May make large parsnip-like roots by October. These are taken up and set in trenches or boxes of earth in the cellar, where a beautiful growth of tender blanched leaves will start. This is the best winter salad plant and, contrary to general belief, it is very easy to grow and blanch for winter use.

Celeriac is a plant that can scarcely be distinguished from celery during the early part of the season. Instead of growing large stalks like celery, however, a bulb some two inches in diameter forms at the base of the top growth. This bulb is a most delicious vegetable, cooked in a variety of ways. We have had particularly good luck in growing celeriac, starting the plants like celery and transplanting to the garden in July. A little earthing up is necessary, just enough to keep the stalks upright so the bulb will form.

There are several other vegetables not commonly seen which are excellent. Perhaps we should mention kohlrabi. This is a sort of a cross between a turnip and a cabbage. If the vegetables are cooked when of the size of an egg, they are of pleasing flavor.—C. H. Chesley.

SUBSIDIZING THE RURAL SCHOOL

(Continued from Page 2).

and only the harder spirits brave the winter. It is a rather new country agriculturally, and the real reason we are making this trip is simply to prove to the most skeptical that there are really fine schools in the sparsely settled sections of the country. The school at Pequot, which was erected a number of years ago, has already been outgrown and other buildings have been pressed into service. In fact, that seems to be the experience all along the line—as soon as a community gets a consolidated school, the attendance jumps rapidly. An interesting feature of this school is a special teacher who is employed to enable the farm boys who enter school late in the fall to catch up with their work, especially those employed during the potato digging season in the fall.

Just about every town on the railroad line that runs to our international boundary boasts a good consolidated school. The second station from Pequot is Pine River, and here is found one of the older consolidations, one which took place in 1912. This school is in Cass County, one of the large counties of the state. About 300 pupils are enrolled in this school, half coming from the town and half from the country.

An interesting feature in connection with this school is the home management house for girls who live too far from Pine River to be transported every morning and evening. There are various positions in connection with this house, such as manager, first housekeeper, second housekeeper, and workers, the girls changing from one position to another. The domestic science teacher acts as matron and a cook is employed. The girls receive one school credit for this work. In a school of this sort, which has more than 300 pupils, the courses of study are divided into academic, agricultural, home training, normal training, commercial and mechanical or shop courses.

These schools in northern Minnesota have been described to show what has been accomplished under pioneer conditions. If such schools as these are maintained in the more sparsely settled sections of a state, with as long winters and as snowy weather as Minnesota, there can hardly be any excuse for poor country schools in more favorably situated communities. It has been found in many parts of Minnesota that real estate men are selling property on the basis of good school facilities, and more than one family has settled in a particular community because a consolidated school was only a short distance away.

The Transportation Problem

The question of transporting children to and from school, which always seems insurmountable in the minds of most school patrons, is often a very small matter after all. If Minnesota can transport its pupils thru snow drifts and cold weather, it certainly can be accomplished in almost any other state. It will be seen that the schools were closed on an average of less than a third of a day each for the entire year on account of impeded transportation. The cost of transportation averaged less than 10 cents a mile per pupil per day, this figure including the round trip. No route is over six, and preferably they should not be over five miles long.

The story that convinced a million motorists

TWO test bottles from the laboratory! They show vividly the cause of bearings that pound, scored cylinders, fouled spark plugs—they show the cause of 90% of the engine troubles you have to pay for.

The bottle at your left, half black, contains ordinary oil after 500 miles of running. The bottle at the right contains Veedol, the lubricant that resists heat. Almost one half of the bottle of ordinary oil is taken up with black sediment formed in use. Under the intense heat of the engine—200° to 1000° F.—inferior oil forms great quantities of sediment.

As the bottles show, sediment is reduced 86% when you use

Veedol. With Veedol most serious engine troubles are eliminated. A million motorists who have seen this picture now use Veedol exclusively.

Have your engine flushed out. Put in Veedol. Leading dealers have it in stock.

Veedol lubricants for every part of the car

Use Veedol lubricants for all parts of the car: VEEDOL for the engine (light zero, medium, heavy, special heavy, extra heavy); for the differential and transmission VEEDOL TRANS-GEAR OIL or GEAR COMPOUND; for the tractor and truck WORM DRIVE OIL; GRAPHITE GREASE; CUP GREASE.

TIDE WATER OIL
Sales Corporation

OHIO FARMS Write for my big catalogue of farms, 1,000 in 13 Counties, any size and price you want. H. H. MASTERS, Farm Agent, Cambridge, Ohio.

Thousands of Happy Housewives in WESTERN CANADA

are helping their husbands to prosper—are glad they encouraged them to go where they could make a home of their own—save paying rent and reduce cost of living—where they could reach prosperity and independence by buying on easy terms.

Fertile Land at \$15 to \$30 an Acre—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre. Hundreds of farmers in Western Canada have raised crops in a single season worth more than the whole cost of their land. With such crops come prosperity, independence, good homes, and all the comforts and conveniences which make for happy living.

Farm Gardens—Poultry—Dairying are sources of income second only to grain growing and stock raising. Good climate, good neighbors, churches, schools, rural telephone, etc., give you the opportunities of a new land with the conveniences of old settled districts.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, and Alberta, reduced railway rates, etc., write Department of Immigration, Ottawa, Can., or

Hints on Varnishing

THERE is just as much fun in applying a coat of varnish to a surface as there is in painting it, and it is as satisfactorily done, too, if one will just observe a few fundamental rules.

Clean the Surface to be Varnished

Get it absolutely clean. If the surface has been previously varnished, clean it with ammonia and water, using one tablespoonful of ammonia to a quart of water, and apply it with a clean cloth. If any grease spots remain, remove them with gasoline or benzine. If there are dark spots on the wood where the varnish has worn off, they can be bleached with an oxalic acid solution (one part oxalic acid crystals per ten parts cold water shaken until dissolved).

When the surface has dried thoroughly, sandpaper it until it is smooth, then wipe off the dust. This is best done with what the painters call a "tack rag." This is merely a piece of clean, lint-free cloth that has been dipped in the varnish about two hours previously and hung up. While the surface may appear perfectly clean, wiping it off with this "tack rag" will show that the pores of the wood were filled with many particles of dust.

Applying the Varnish

The bare spots should be given a first coat of varnish, thinned to about ten per cent with turpentine, and allowed to dry before the entire surface is varnished. When this operation has been completed, close the room, and wait until all dust has had a chance to settle. Better not apply the full coat until the next day. The temperature of the room in which the varnishing is to be done should be around 70 to 75 degrees Fahrenheit. If the house is artificially heated, it may be well to ventilate the room early in the morning, but only enough to allow the escape of any gases. Then close all windows and doors, and when the temperature is right you are ready to apply the varnish.

Your local dealer will sell you the proper kind of varnish for the surface on which it is to be applied. He will also sell you the proper kind and width of brush. See that the latter is full-bristled, elastic, and of good quality. Tap it several times on something hard, and run the bristles across the fingers to remove the dust. If any dust is left in these fine specks will pile up when carried along thru the varnish, and will look like grains of sand later. A good cleaning of the brush in turpentine will make it dustproof.

Do not shake or stir the contents of the varnish can. Open it carefully and pour into another clean vessel as much varnish as you think will be needed for the job. If any is left over, you might as well throw it away if there is no other place to use it. Do not pour it back into the supply can. Never pour back into this can any varnish in which a brush has been dipped.

Begin applying with brush well filled, and try to give the surface an even coat, not too thick or too

thin. If it is being applied too thin, the brush will drag on the surface. And if too thick, the brush will leave a raised trail. Too much varnish on a perpendicular surface will "sag" and form a "curtain." Too much on a horizontal surface will not dry for a long time.

Watch the corners and edges to see that there is no "running over." After varnishing the entire surface, wipe the brush across the top of the container to remove as much varnish as possible, and go over the corners, edges and any carved surfaces to take up any extra material. Then go out of the room, and leave the door closed for at least four hours. The average varnish will set dust free in about three hours, but give it a chance. During the setting period it must be left alone. Any person walking into the room "to see how fine it looks" will stir up enough dust to speak the finish.

The Second Coat

In 48 hours the varnish will have dried hard, and is then ready for rubbing and the application of the second coat. It is not economy to apply only one coat. When the first coat is thoroughly dry, go over it with fine sandpaper. If it is sanded off before first coat is thoroughly dry, there will be great danger of the first coat "sweating," which will cause pits in the second coat. Wipe off all resulting dust, and apply the second coat, giving it equal, if not more, care and attention than the first coat. Allow the same length of time for drying, keeping the temperature as uniform as possible.

There has always been some discussion among painters as to the advisability of ventilating a newly varnished room, but the majority claim that it is unnecessary because there is enough oxygen in the air to dry the varnish properly. And it is well known that when outside air is let in, particularly if it is cold and damp, the varnish will absorb some of the dampness and dry with a clouded appearance known as "blooming." This result, however, can be overcome afterward by rubbing the surface with a good grade of furniture polish.

Varnishing New Woodwork

On new wood, as on old, the surface must be sanded as smoothly as possible. If the wood is pine, fir or any other close-grained wood, no filler will be required. If a color other than natural is desired, an oil stain must be applied. This should not be sanded afterward. When the stain has dried for 24 hours, the first coat of varnish, thinned to about ten per cent with turpentine, should be applied, using the same care and precautions as above described.

When the priming coat has dried go over it with fine sandpaper, then thoroughly remove the dust, and apply the second coat just as it comes from the can without thinning.—J. E. D.

Begin applying with brush well filled, and try to give the surface an even coat, not too thick or too

The Juliette Richly Embroidered LINENE DRESS

\$4.98 During This Sale Special Advertising Offer

Send No Money

The Juliette is made of medium weight linen—very popular—rich looking, suitable for all occasions. Embroidered with exclusive designs. Lined with fine, soft material. Beautifully made. In three colors: white, blue, and green. Each color has a different design. Color, size, and style. Write for full details. No money now, just your name and address. The Juliette is a real bargain. Write today. DAVID STRONG COMPANY, Dept. M833, Chicago.

PENNSYLVANIA FARMER 261 S. Third St., Philadelphia, Pa.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3530.—Pleasant Dress.—It is cut in 3 sizes: 16, 18 and 20 years. An 18-year size will require 6 1/2 yards of 40-inch material. Voile, foulard, challie, figured or embroidered batiste, linen, satin, pongee, poplin and etamine could be used for this model. The width of the skirt at the foot is 2 yards. Pattern, 10 cents.

3235.—A Very Attractive Apron.—It is cut in 4 sizes: Small, 32-34; medium, 36-38; Large, 40-42; Extra Large, 44-46 inches bust measure. A medium size will require 4 1/2 yards of 27-inch material without the sash. Pattern, 10 cents.

3546.—New Skirt Model.—It is cut in 7 sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. A 28-inch size will require 2 1/2 yards of 54-inch material. Broadcloth, duvetyne, tricotine, crepe, taffeta, velours, serge and cotton fabrics are good for this style. With plaits extended the width of the skirt at the foot is about 2 3/4 yards. Pattern, 10 cents.

Stocking Hair Brushes.—Did you ever brush your hair with a clean old silk stocking pulled over the bristles of the brush? One look at the stocking when you're thru will explain why your hair looks and feels so clean.

Transparent Apples.—Drop whole unpared, uncored apples into a heavy syrup and cook slowly for several hours. The fruit will be transparent and delicious, especially if a tablespoonful or so of honey is added to a quart of syrup.

Monotony of Mud.—Nobody knows it any better than the housewife. Teach dad and the boys that the doorman and scraper are there for a purpose.

WEAVER PIANOS

THE depth of feeling, the power, the pure rounded tones with which the Weaver renders the old-time melodies find their way into the hearts of all who know and appreciate good music. The simplest lullaby or the most profound composition finds its full complement in its delicately responsive action and perfectly graduated scale.

Years and years of pianoforte building have not dulled the patience nor lessened the care of the Weaver master craftsmen. Every Weaver that leaves their hands has exacted all the pains, all the skill, all the artistic temperament they can possibly bestow upon it. And it goes into the world an artistic triumph.

No wonder professional musicians and music lovers have such high praise for Weaver Pianos. They realize with the true artist's instinct that the Weaver is as near perfect as an instrument can be made. You have only to possess one to realize its worth.

The Voice of the Pack

by Edison Marshall

CHAPTER XV

THE SNOW was steel-gray in the moonlight when the little party made their start down the long trail. Their preparations, simple and crude as they were, had taken hours of ceaseless labor on the part of the three. The ax, its edge dulled by the flame and its handle burned away, had been cooled in the snow, and with his one sound arm, Lennox had driven the hot nails that Snowbird gathered from the ashes of one of the outbuildings. The embers of the house itself still glowed red in the darkness.

Dan had cut the green limbs of the trees and planed them with his ax. The sled had been completed, handles attached by pushing it, and a piece of fence wire fastened with nails as a rope to pull it. The warm mackinaws of both of them as well as the one blanket that Lennox had saved from the fire were wrapped about the old frontiersman's wasted body—Dan and Snowbird hoping to keep warm by the exercise of propelling the sled. Except for the dull ax and the half-empty pistol, their only equipment was a single charred pot for melting snow that Dan had recovered from the ashes of the kitchen.

The three had worked almost in silence. Words didn't help now. They wasted no sorely-needed breath. But they did have one minute of talk when they got to the top of the little ridge that had overlooked the house.

"We'll travel mostly at night," Dan told them. "We can see in the snow, and by taking our rest in the daytime, when the sun is bright and warm, we can save our strength. We won't have to keep such big fires then—and at night our exertion will keep us as warm as we can hope for. Getting up all night to cut green wood with this dull ax in the snow would break us to pieces very soon, for remember that we haven't any food. I know how to build a fire even in the snow—especially if I can find the dead, dry heart of a rotten log—but it isn't any fun to keep it going with green wood. We don't want to have to spend any more of our strength stripping off wet bark and hacking at saplings than we can help; and that means we'd better do our resting in the heat of the day. After all, it's a fight against starvation more than anything else."

"Just think," the girl told them, reproaching herself, "if I'd just shot straight at that wolf today, we could have gone back and got his body. It might have carried us thru."

Neither of the others as much as looked surprised at these amazing regrets over the lost, unsavory flesh of a wolf. They were up against realities, and they didn't mince words. Dan smiled at her gently, and his great shoulder leaned against the

traces.

They moved thru a dead world. The ever-present manifestations of wild life that had been a delight to Dan in the summer and fall were quite lacking now. The snow was trackless. Once they thought they saw a snowshoe rabbit, a strange shadow on the snow, but he was too far away for Snowbird to risk a pistol shot. The pound or two of flesh would be sorely needed before the journey was over, but the pistol cartridges might be needed still more. She didn't let her mind rest on certain possibilities wherein they might be needed. Such thoughts stole the courage from the spirit, and courage was essential beyond all things else

WHEN PA IS SICK

When pa is sick,
He's scared to death,
An' ma an' us
Just holds our breath.

He crawls to bed
An' puffs and grunts,
An' does all kinds
Of crazy stunts.

He wants Doc. Brown
An' mighty quick;
For when pa's ill,
He's awful sick.

He gasps and groans
An' sort o' sighs,
He talks s' queer
An' rolls his eyes.

Ma jumps an' runs
An' all of us
An' all the house
Is in a fuss.

An' peace an' joy,
Is mighty skeerce—
When pa is sick
It's somethin' fierce.

WHEN MA IS SICK

When ma is sick
She pegs away,
She's quiet though,
Not much t' say.

She goes right on
A-doin' things,
An' sometimes laughs,
Or even sings.

She says she don't
Feel extra well,
But then it's just
A kind o' spell.

She'll be all right
Tomorrow sure,
A good old sleep
Will be the cure.

An' pa he sniffs,
An' makes a kick,
Says woman-folks
Is always sick.

An' ma she smiles,
Let's on she's glad—
When ma is sick,
It aint s' bad.

to bring them thru.

Once a flock of wild geese, stragglers from the main army of waterfowl, passed overhead on their southern migration. They were many months too late. They called down their eerie cries—that song that they had learned from the noise the wind makes, blowing over the bleak marshes. It waited down to them a long time after the flock was hidden by the distant tree tops, and seemed to shiver, with curious echoes, among the pines. Trudging on, they listening to its last note. And possibly they understood the cry as never before. It was one of the untamed, primitive voices of the wilderness, and they could realize something of its sadness, its infinite yearning and complaint. They knew the wilderness now, just as the geese themselves did. They knew its cold, its hunger, its remorselessness, and beyond all, the fear that was bright eyes in the darkness. No man could have crossed that first twenty miles with them and remained a tenderfoot. The wild was sending home its

lessons, one after another, until the spirit broke beneath them. It was showing its teeth. It was reminding them, very clearly, that in spite of houses built on the ridges and cat-tle pens and rifles and all the tools and aids of civilization, it was still unconquered.

Mostly the forest was heavily laden with silence. And silence, in this case, didn't seem to be merely an absence of sound. It seemed like a substance in itself, something that lay over the snow, in which all sound was immediately smothered and extinguished. They heard their own footfalls in the snow and the crunch of the sled. But the sound only went a little way. Once in a long time distant trees cracked in the frost; and they all stood still a moment, trying to fight down the vain hope that this might be some hunter from the valleys who would come to their aid. A few times they heard the snow sliding, with the dull sound of rolling window shade, down from the overburdened limbs. The trees were inert with their load of snow.

As the dawn came out, they all stood still and listened to the wolf pack, singing on the ridge some-

"That leaves a work-day of nineteen hours," Dan persisted. "Not any too little. Five hours it will be."

He found where the snow had drifted against a great, dead log, leaving the white covering only a foot in depth on the lee side. He began to scrape the snow away, then hacked at the log with his ax until he had procured a piece of comparatively dry wood from its center. They all stood breathless while he lighted the little pile of kindling and heaped it with green wood—the only wood procurable. But it didn't burn freely. It smoked fitfully, threatening to die out, and emitting very little heat.

But they didn't particularly care. The sun was warm above, as always in the mountain winters of Southern Oregon. Snowbird and Dan cleared spaces beside the fire and slept. Lennox, who had rested on the journey, lay on his sled and with his uninjured arm tried to hack enough wood from the saplings that Dan had cut to keep the fire burning.

At three they got up, still tired and aching in their bones from exposure. Twenty-four hours had passed since they had tasted food, and their unrelieved system complained. There is no better engine in the wide world than the human body. It will stand more neglect and abuse than the finest steel motors ever made by the hands of European craftsmen. A man may fast many days if he lies quietly in one place and keeps warm. But fasting is a deadly proposition while pulling sledges over the snow.

Dan was less hopeful now. His face told what his words did not. The lines cleft deeper about his lips and eyes; and Snowbird's heart ached when he tried to encourage her with a smile. It was a wan, strange smile that couldn't quite hide the first sickness of despair.

The shadows quickly lengthened—simply leaping over the snow from the fast-falling sun. Soon it dropped behind the ridge; and the gray of twilight began to deepen among the more distant trees. It blurred the outline and dulled the sight. With the twilight came the cold, first crisp, then bitter and penetrating to the vitals. The twilight deepened, the snow turned gray, and then, in a vague way, the journey began to partake of a quality of unreality. It was not that the cold and the snow and their hunger were not entirely real, or that the wilderness was no longer naked to their eyes. It was just that their whole effort seemed like some dreadful emburdened journey in a dream—a stumbling advance under difficulties too many and real to be true.

The first sign was the far-off cry of the wolf pack. It was very faint, simply a stir in the ear drums, yet it was entirely clear. That clear, cold mountain air was a perfect telephone system, conveying a message distinctly, no matter how faintly. There were no tall buildings or cities to disturb the ether waves. And all three of them knew at the same instant it was not exactly the cry they had heard before.

They couldn't have told just why, even if they had wished to talk about it. In some dim way, it had lost the strange quality of despair that it had held before. It was as if the pack were running with renewed life, that each wolf was calling to another with a dreadful sort of exultation. It was an excited cry too—not the long, sad song they had learned to listen for. It sounded immediately behind them.

"Too long, if we were going to make it out," Lennox objected.

They couldn't help but listen. No human ears could have shut out the sound. But none of them pretended that they had heard. And this was the worst sign of all. Each one of the three was hoping against hope in his very heart; and at the same time, hoping that the others did not understand.

For a long time, as the darkness deepened about them, the forests were still. Perhaps, Dan thought, he had been mistaken after all. His shoulders straightened. Then the chorus blared again.

The man looked back at the girl, smiling into her eyes. Lennox lay as if asleep, the lines of his dark face curiously pronounced. And the girl, because she was of the mountains, body and soul, answered Dan's smile. Then they knew that all of them knew the truth. Not even an inexperienced ear could have any delusions about the pack song now. It was that oldest of wilderness songs, the hunting-cry—that frenzied song of blood-lust that the wolf pack utters when it is running on the trail of game. It had found the track of living flesh at last.

"There's no use stopping, or trying to climb a tree," Dan told them simply. "In the first place, Lennox can't do it. In the second, we've got to take a chance—for cold and hunger can get up a tree where the wolf pack can't."

He spoke wholly without emotion. Once more he tightened the traces of the sled.

"I've heard that sometimes the pack will chase a man for days without attacking," Lennox told them. "It all depends on how long they've gone without food. Keep on and try to forget 'em. Maybe we can keep 'em bluffed."

But as the hours passed, it became increasingly difficult to forget the wolf pack. It was only a matter of turning the head and peering for an instant into the shadows to catch a glimpse of one of the creatures. Their forms, when they emerged from the shadows of the tree trunks, were entirely visible against the snow. They no longer yapped and howled. They acted very intent and stealthy. They had spread out in a great wing, slipping from shadow and shadow, and what were their mental processes no human being may even guess. It was a new game; and they seemed to be seeking the best means of attack. Their usual fear of men, always their first emotion, had given way wholly to a hunting cunning: an effort to procure their game without too great risk of their own lives. In the desperation of their hunger they could not remember such things as the fear of men. They spread out farther, and at last Dan looked up to find one of the gray beasts waiting, like a shadow himself, in the shadow of a tree not one hundred feet from the sled. Snowbird whipped out her pistol.

"Don't dare!" Dan's voice cracked out to her. He didn't speak loudly; yet the words came so sharp and commanding, so like pistol fire itself, that they penetrated into her consciousness and choked back the nervous reflexes that in an instant might have lost them one of their three precious shells. She caught herself with a sob. Dan shouted at the wolf, and it melted into the shadows.

"You won't do it again, Snowbird," he asked her very humbly. But his meaning was clear. He was not as skilled with a pistol as she; but if her nerves were breaking, the

gun must be taken from her hands. The three shells must be saved to the moment of utmost need.

"No," she told him, looking straight into his eyes. "I won't do it again."

He believed her. He knew that she spoke the truth. He met her eyes with a half smile. Then, wholly without warning, Fate played its last trump.

Again the wilderness reminded them of its might, and their brave spirits were almost broken by—the utter remorselessness of the blow. The girl went on her face with a crack of wood. Her snowshoe had been cracked by her fall of the day before, when running to the fire, and whether she struck some other obstruction in the snow, or whether the cracked wood had simply given way under her weight, mattered not even enough for them to investigate. As in all great disasters, only the result remained. The result in this case was that her snowshoe, without which she could not walk at all in the snow, was irreparably broken.

CHAPTER XVI

"Fate has stacked the cards against us," Lennox told them, after the first moment's horror from the broken snowshoe.

But no one answered him. The girl, white-faced, kept her wide eyes on Dan. He seemed to be peering into the shadows beside the trail, as if he were watching for the gray forms that now and then glided from tree to tree. In reality, he was not looking for wolves. He was gazing down into his own soul, measuring his own spirit for the trial that lay before him.

The girl, unable to step with the broken snowshoe, rested her weight on one foot and hobbled like a bird with broken wings across to him. No sight of all this terrible journey had been more dreadful in her father's eyes than this. It seemed to split open the strong heart of the man. She touched her hand to his arm. "I'm sorry, Dan," she told him. "You tried so hard—"

Just one little sound broke from his throat—a strange, deep gasp that could not be suppressed. Then he caught her hand in his and kissed it—again and again. "Do you think I care about that?" he asked her. "I only wish I could have done more—and what I have done doesn't count. Just as in my fight with Cranston, nothing counts because I didn't win. It's just fate, Snowbird. It's no one's fault, but maybe, in this world, nothing is ever any one's fault." For in the twilight of those winter woods, in the shadow of death itself, perhaps he was catching glimpses of eternal truths that are hidden from all but the most far-seeing eyes.

"And this is the end?" she asked him. She spoke very bravely.

"No!" His hand tightened on hers. "No, so long as an ounce of strength remains. To fight—never to give up—may God give me spirit for it till I die."

And this was no idle prayer. His eyes raised to the starry sky as he spoke.

"But, son," Lennox asked him rather quietly, "what can you do? The wolves aren't going to wait a great deal longer, and we can't go on."

"There's one thing more—one more trial to make," Dan answered. "I thought about it at first, but it was too long a chance. And I suppose you thought of it too."

(Continued Next Week.)

GOMBAULT'S CAUSTIC BALSAM

THE STANDARD REMEDY
HUMAN and VETERINARY

Soothing and Healing--A Perfect Antiseptic

As a veterinary remedy its curative qualities have been acknowledged for many years in cases of Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Spavin, Ringbone and other bony tumors. A trial will convince anyone that here is a remedy without an equal. Write for any information desired. \$1.75 per bottle at druggists or sent by parcel post on receipt of price.

CRESTMONT FARM, 31 N. FOURTH ST., SUNBURY, PA.

BRADFORD COUNTY PURE BRED LIVESTOCK
The Bradford County Livestock Breeders' Association consists of one hundred and fifty actual breeders of registered livestock who depend on their herds for their living. They know their cattle because they live with them and are thus able to definitely realize their every-day usefulness for production purposes.

As a result of these farmer-breeders being able to co-operate in this organization, you are enabled to secure registered livestock of such prices as will surprise you and of quality to satisfy. Make inquiry now for information on registered Holsteins, Jerseys, Milking Shorthorns, Ayrshires and Guernseys, either sex. Some remarkable bargains in young bulls. Time and inconvenience will be saved if you state your wants definitely in your inquiry. Address all inquiries to **D. K. SLOAN, Secretary, Bradford County Livestock Breeders Assn., Towanda, Pa.**

200 HOLSTEINS
Guaranteed HEALTHY
Carload of any age in Registered or Grades
Calves, yearlings, 2 year olds, cows or bulls
60 Day Test Guaranteed
High grade better calves \$20 each
John C. Regan, Tully, N. Y.

BULL CALVES AT BARGAIN PRICES
We offer Farmers and Breeders of Guernseys an opportunity to secure exceptionally bred, healthy bulls from a clean, tuberculin tested herd at reasonable prices. King of the May-July Double-Grades Secret, and Glenwood breeding out of A. H. dams or dams that will be tested. Write for name list and pedigrees. LEADER'S POULTRY FARM

Is a breeding plant—not a hatchery—Quality to command here, not more size or capacity. Hollywood Leghorn Blood Predominates in our stock. Those who follow correct poultry know that Hollywood is a real winner for business in every corner of the U. S. year after year. If you buy 500 or more chicks it will be to visit our farm before placing any order anywhere. We cater in particular to the needs of the poultryman and egg farmer. In spite of our capacity of 1000 to 4000 chicks weekly we are sold out for March and April. Orders accepted for delivery May 2nd, 10th, 17th and 20th, at \$17 per 100, \$30 per 200, Barred Rocks and Rhode Island Reds, \$2 per 100 higher. State delivery by parcel post or express prepaid, guaranteed.

LEADER'S POULTRY FARM, R. 2, YORK, PA.

C. B. Huff's Barred Rocks

again win in North American Egg Laying Contest. My pen of 6 birds finished in 4th place, all varieties competing, laying 1,030 eggs in 52 weeks. Also fine J. L. Brahmas, Eggs, \$2 to \$5 per 15.

C. B. HUFF, NORTH WATER GAP, PA.

KEEPING SMOKED MEATS

I write to ask you if you can advise me any way I can keep side meat from getting moldy after it has been cured and hung up. Would it be advisable to keep it in pickle all season? Would the pickle have to be changed frequently and if so how often?—James Lusby.

The keeping of smoked meat without becoming moldy is one of the problems of the farmer who prepares his own supply of meat. The development of a dry mold on the outside of the meat does not injure the meat to any extent except that it makes it inconvenient and somewhat wasteful when removed before the meat is used.

There are several fairly satisfactory ways of keeping the meat in good shape after it has been smoked. If it is used early in the spring or summer it may be left in the smoke house and occasional smoke built under the meat. This practice will keep away skippers. The house should be screened so that flies cannot get on the meat, but there should be circulation of air. If it is to be kept until late in the summer, it may be wrapped in paper and muslin and packed in a grain bin but not close enough for the pieces to touch. It can also be kept in a satisfactory manner when packed unwrapped in granulated rock salt as the smoked meat will absorb but little of the salt.

Another satisfactory way of keeping the meat is to wrap it in paper and burlap and cover it with a yellow wash. After the meat has been washed with this material it should be hung up and not put up on a pile. The direction for making and applying this material is as follows: For 100 pounds of hams or bacon, use 3 pounds of barium sulphate, 1 ounce dry glue, 14 ounces chrome yellow, 6 ounces flour. Fill a pail about one-half full of water and put the flour in it, breaking up the lumps thoroughly. Mix the chrome yellow in a quart of water in a separate vessel, add the glue and pour both into the flour and water mixture. Bring the mixture to a boil and add the barium sulphate, stirring it slowly. Allow the mixture to cool thoroughly after which it is applied with a brush. Stir the mixture while it is being applied. It would not be advisable to leave the meat in the pickle unless it is to be used as salt pork. The mixture might have to be changed, especially if sugar or syrup have been used as an ingredient for curing.—W. H. Tomhave.

MINERALS IN STOCK FEED

In what form is it best to feed lime and other minerals to livestock with their grain and roughage? I understand that minerals should be fed for the best welfare of the animal but do not know where to get them in the proper form.—A. R., Bucks Co., Pa.

A. R.—In calculating rations, it is important to consider the calcium and phosphorous content of the feeds that are used. Such feeds as straw, chaff, timothy hay, root crops, molasses, cereals and their by-products such as bran and middlings are low in calcium. Crops grown on land low in lime are also usually low in

this element. Legume crops such as clover, alfalfa, beans and peas are high in calcium or lime. Such roughages as straw, chaff, timothy hay and molasses are low in phosphorus while the cereal crops and their by-products and packing house by-products carry it in abundance.

Animals fed a ration that is deficient in these elements will not do well; especially is this true of growing animals. Experiments show that where lime alone is lacking, it can be supplied by feeding legume hay or the lime can be fed in the form of chalk or ground limestone. If phosphorous alone or both lime and phosphorous are lacking, these may be supplied in ground rock phosphate or else in the form of bone ash or bone meal.

The ground rock phosphate and the ground lime alone can no doubt be secured on the local market. The local feed dealer can also secure the bone ash or bone meal.—W. H. T.

FEED FOR YOUNG PIGS

I have just bought 4 nice shoats about 50 pounds each. They don't seem to like anything I feed them. Have tried red and white middlings, corn and oats chop, stale bread, sour milk and buttermilk. I also sifted the oat hulls out of the chop and still they go on like wild for something to eat when I go in the pen.—H. C. T., Berks Co., Pa.

H. C. T.—There seems to be no apparent reason why these pigs will not eat the feed that is being offered them, except that the pigs may not have become accustomed to their new environment. The feeds that you are giving them can be combined in such a manner as to make a fair ration for pigs of this weight. I believe that these pigs should be allowed to run out in a yard or lot instead of being closely confined. The ration which is being fed might be improved by introducing some corn into it. A combination of two parts corn, one part of the middlings and one part oats will make a good growing ration if fed with a liberal allowance of skim milk or buttermilk. If the milk cannot be had, add one part of tankage or fish meal to the mixture.

Change the feed to the combination that has been suggested and allow them to run out in a yard or paddock and there should be no trouble to get them to eat and do well.—W. H. T.

HOGGING OFF CORN

That it pays the farmer to "hog off corn" is shown in the results of twelve Pennsylvania counties where farmers co-operated with the farm agents and agricultural extension men from the Pennsylvania State College. By allowing the hogs to harvest part of the corn crop, an average price of \$1.40 was realized per bushel in the net gain of pork from corn in the field, when unharvested corn in the field was valued at sixty to eighty cents a bushel. The average daily gain on corn in last fall's test was 1.5 pounds, a total of 422 pounds of pork being produced on an acre of corn having an average yield of 43.4 bushels.

Grow Hogs and Poultry on Semi-Solid Buttermilk

Quick, Economical Growth Means Less Feed, Less Time, More Money
Experienced feeders know the value of pure, rich buttermilk. Semi-Solid Buttermilk is fresh cream buttermilk with water taken out. Averages 50 lbs. to a barrel and makes 1000 gallons of rich buttermilk feed. All you do is add water. Ideal to mix and use in combination with grain, mash and other feeds. Also acts as a wonderful tonic and conditioner. Keeps stock healthy and full of pep. Nothing better for weanling pigs and baby chicks. Write TODAY for further information on Semi-Solid Buttermilk and facts about Feeding for Profit.

DEATH OF MASTER OF NEW YORK STATE GRANGE

Grange members of New York state are much saddened by the death of their loved State Master, W. Newton Giles, of Skaneateles. Mr. Giles was born in 1859, and has been an active Grange member since 1877, when he joined the Owasco grange in Cayuga County. He was elected to various offices in it and in 1889 transferred to Skaneateles Grange. He was elected state secretary in Herkimer in 1900, and held that office until 1920, when he succeeded present National Master Lowell, as master of the New York State Grange.

For 37 of the State Grange's 47 years of existence he has attended every session of that body. Where his genial good cheer, and fun loving nature, his clear sighted policies and his well expressed sentiments have made him easily one of the most loved grange members in the state. His voice had splendid carrying powers and he was always sure of an attentive audience no matter how enormous the hall or how difficult its acoustic properties.

He knew the Grange, its law—its traditions and its membership in an intimate way equaled by no other man in the state. He also knew its power thru its membership as none other. For years he has been a live member of the State Grange's legislative committee and his counsels were valued at Albany as perhaps no other farmer's were.

COUNTY NOTES

Lancaster Co., Pa.—Farm sales have been in full swing during February and March and prices have been good for live stock and farm implements tho a shade lower than last year. The attendance has been above the average owing partly to the mild weather.

A good deal of plowing has been done during the winter. The wheat shows up fine. Fruit growers are fearful of later frosts, as the buds are beginning to swell. Tobacco stripping is about finished but a good percentage of the crop is still unsold.—J. B. M.

Mifflin Co., Pa.—Are having warm and spring-like weather with rain every few days which keeps the road wet and bad for hauling. Wheat and grass fields are getting green. Fruit and some other trees are swelling their buds. Leaves on the red raspberry can be plainly seen and the strawberries are pushing up thru their winter coat of mulching. Farmers are building fences and hauling manure, a few have plowed a little. Grain prices paid by dealers: Wheat, \$1.60; corn, 75c; oats, good, 60c; other produce, butter, 60c; lb.; eggs, 30c; potatoes, \$1; apples, 80c to \$1; little onions, 20c qt.; bacon, 20c lb.; lard, 15c lb. Many sales going on, at which farm implements are bringing good prices, stock selling much lower than a year ago. Many laboring men still idle as public works have not started up yet.—J. H. Byler.

Lebanon Co., Pa.—Roads are bad on account of the heavy trucks. Farmers are having a hard time marketing their products. The prevailing price for wheat is \$1.75; corn, 70c, oats 50c. Dealers offer 25c for potatoes and there are many thousands of bushels in storage. Eggs, 30c dozen and butter 65c lb.—A. Dohner.

Fresh—Surveying a little?
Engineer—No! surveying a lot.

In almost every county we have a representative, trained and holding a diploma as a Water and Light Expert. He explains to you everything you want to know—in detail—without charge. He helps you figure out a practical, economical system for your farm. Let us send you the name of the Expert near you.

The Expert Explains How You Run Your "Milwaukee" Water System

The above is the only equipment you need with a Milwaukee Air Power Water and Light System—simple, easy and economical to operate, sturdy and lasting. In addition there is only the pipes and the pump at the bottom of the well.

You can also run a Milwaukee Lighting System from the same power—installing now or at a later date.

Notice that there are no water storage tanks. Water stored in tanks becomes stale, unrefreshing, loses a great portion of its benefit. Your Milwaukee Water System will deliver water to your house, barns and troughs always fresh, cool, pure, refreshing and beneficial. Our big new illustrated book tells you what you should know about water systems—and what other farmers think of them. Write us for this free book and the name of the water and light expert who lives near you.

MILWAUKEE AIR POWER PUMP CO.

Air Power **WATER** **LIGHT** Systems

PURE FARM SEEDS

That conform strictly to seed laws of all states. Clover, Alsike, Timothy, Alfalfa, Soy Beans and all kinds of PURE FARM SEEDS. Twenty-five years selling seeds and satisfaction. Write for free samples.

THE A. C. HOYT COMPANY
FOSTORIA, OHIO

Reynolds Shingles

Save On Insurance Rates

Approved by the National Board of Fire Underwriters and recognized by insurance companies for their fire-resisting qualities. With limited fire protection in rural districts, it is essential for farmers to have the best roof covering obtainable. For more than 20 years Reynolds Shingles have maintained a distinct leadership. Backed by a positive guarantee that passes to you through our authorized dealer.

H. H. REYNOLDS SHINGLE CO.
"Originators of the Asphalt Shingle"
GRAND RAPIDS, MICHIGAN
Reynolds Shingles Grow More Beautiful With Age

Cabbage Plants

Pullwoods frostproof, will stand a temperature of 15 degrees above zero. Plant now and have early cabbage. All leading varieties. Prices by express 1000 to 4000 at \$2.00 per 1000. 5000 and over at \$1.50 per 1000. By parcel post prepaid, 100 for 50c, 500 for \$1.50, 1000 for \$2.50. Greater quantities tomato plants same prices as cabbage. Satisfaction guaranteed or money refunded.

P. D. FULWOOD, Dept., K, Tifton, Ga.

TREES & PLANTS THAT GROW

A Guarantee Worth While. Express Prepaid. For over 60 years we have supplied nursery stock to people who know and appreciate the best. Write for Catalogue now. PETER BOHLER & SON, Spring Hill Nursery, Box 37, Tecumseh City, (Miami Coast) Fla.

NOWHERE is the need for reducing the cost of production more urgent than in the case of the great staple crops **Corn, Grain, Hay**. These have always been low value per acre crops. Their labor cost factor is high. A double yield per acre involves but little additional labor.

Fertilizers are the direct means to increase yield. For the best results, fertilizers must be properly balanced.

One-sided fertilization spells soil exhaustion. Balance the fertilizer with 5 to 10 per cent. of Potash. There is plenty of it now.

The Immigrant and Farming

Examples of Successful Colonies in New Jersey Where Immigrants are Located

By L. G. GILLAM

At this time, when the matter of restricting immigration for a period of months is before the country, the question is often asked in our rural sections as to the relation of the immigrants to the farming industry and their effect on local conditions. Here in the Eastern States we read in our daily papers of the arrival at Ellis Island, New York, of a ship-load of immigrants bound for the farming sections and we often wonder as to their final destination. As a matter of sound economics the various states have, for many years, made a bid for immigrants to settle on their unused or undeveloped farm lands. Some have been attracted thru such efforts while many others have located in certain sections because relatives or friends have preceded them. There are now many Italian, Polish, Bohemian, Slovak, Hebrew and Portuguese farm settlements in the United States in addition to the long established numbers of Swedes, Danes, Norwegians and Germans. The report of the Senate Immigration Commission of 1919 mentions 105 farm colonies of the more recent immigrants in 19 states east of the Mississippi River.

Successful Immigrant Colonies

As an example of successful colonies of this type in the East the Italian farm colonies in South Jersey are a fine illustration of what some of our immigrants have achieved with very little money, influence or education. Unremitting toil, strict honesty, and great patience have accounted largely for the prosperity of these South Jersey Italians, who have preserved much of the warm-hearted cheer and enjoyment in simple outdoor life that distinguish their former homeland. These colonies are located mainly at East Vineland, Landisville and Buena in Cumberland and Atlantic counties and comprise in the whole several square miles of the light, easily-worked soils so familiar to many parts of southern New Jersey and which these Americanized farmers have found highly adapted to the growing of peppers, sweet potatoes, tomatoes and small fruits.

To illustrate how extensively the Italians have settled in this section of the East attention is called to figures of the last Census which show that in Cumberland County, N. J., alone there were, on January 1, 1920, 321 farm owners and 21 farm tenants who were born in Italy and who own farm property valued at \$1,726,000. In addition it is estimated that there are 120 farms in the same county owned or rented by American-born Italians which places the value of farm property owned by Italians and Italian descendants in Cumberland County at approximately \$2,226,000.

The development of these colonies is interesting. The first settlers came to this country and to South Jersey shortly after the Civil War thru the efforts of Charles K. Landis, the founder of Vineland. Believing that Italians would be interested in the country round about this town because of the similarity of climate to that of some parts of Italy Mr. Landis advertised in a New York Italian newspaper for immigrants to found an Italian Colony there. Most of those attracted by this method came from the old coun-

try by the way of New York where they worked until they saved enough money to settle on the Landis tract. Few of the settlers had any considerable sum of money so they bought the uncleared land in small tracts which averaged about 20 acres in size, paying \$20 to \$25 per acre for it and obtaining it by giving \$50 or \$100 only at the time of purchase. The new owner usually erected a small frame cabin and began to clear the land at odd times. During the summer he worked by the day for neighbors and often hired out with his entire family to pick berries. Some worked on the railroad or in the mills or glass works, putting in every spare moment on their own land. A few chickens and a horse were the first livestock purchases and nearly every man was able to make a living from his farm and poultry the second or third year and at the same time to meet his payments by his outside day labor. Several paid for their original tracts in three years and at once began to buy more land.

Almost all of the first comers or their sons are now well-to-do farmers with fine farms, good buildings and money in the banks. Since 1890 many have bought out previous owners, and settled on cleared land. All have passed thru seasons of depressed agriculture that proved their ability to hold fast and by persevering industry to weather financial crises and outlast the thrip, the rot and the blight to which some farmers were forced to succumb. "New Italy" as it is called, four miles east of Vineland, was founded in 1885 and is in the heart of the present Italian settlement. The present population for miles around is purely Italian with its two Italian churches and good schools but with no factories or industries other than farming and fruit. It is an agricultural colony in every sense, and the productive farms, substantial buildings and houses and well-kept vineyards proclaim its success.

Future Problems Perplexing

The settlement of our immigrants in colonies of this type is a step toward the solution of the many problems confronting the immigration authorities. The immigration figures for 1920 show that up to September 1, approximately 800,000 aliens had landed and that for the remaining four months the probable arrivals would increase the number beyond 1,000,000 provided ships were available. The character of the incoming peoples is not that of the races that have made this country great. As the undertaking to Americanize them is a big one, the proposed remedy is to limit newcomers to the number and kinds who could be absorbed into American social and economic life.

Legislation of this nature will be inevitable unless an immediate change is instituted. Instead of going to farms and being numbered among the great mass of Americans, foreigners are congregating in large groups in industrial centers where they speak their own language, have their own banks, insurance companies and newspapers and in some instances their own

schools. The conclusion is obvious. Either we can never become a homogeneous American people if unassimilated masses of Europeans must share our country with us or we must set limits to the tide of immigration so that a unified national life shall remain possible for us.

Farming Can Help Solve the Problem

Immigrants often lack initiative but it is largely ignorance of where to get farm work and the dire need of ready money that forces many peasants to take up work in construction gangs, factories or whatever comes to hand. A strenuous effort should be made to get such people directed toward the rural sections thus making a beginning in their Americanization and at the same time providing cheap labor supply for our farming sections. Colonies as described above are another means of assimilation.

There are many farm-raised immigrants in the United States who want farm work and some who desire idle land for farming purposes. To bring them together is largely a matter of local enterprise for which the American of tomorrow will be the better if it is done without delay.

MORE FARM BUREAUS TO GIVE 95 PER CENT ORGANIZATION

With the recent organization of county farm bureaus in Elk and Montour Counties and the proposed organization of one in Fulton County, all but three of the sixty-seven Pennsylvania counties will have farm bureaus. By the beginning of summer these additional counties will have extension representatives from the Pennsylvania State College acting as county agents, and a 95 per cent agricultural extension service will be in operation in Pennsylvania. This organization will place the state in the first rank of farm extension work, few states being organized with so high a percentage.

There are now sixty farm agents in the field. Perry County has had a farm bureau for several months and will have a representative in the near future. Fulton County was organized in March. Elk and Montour have been delayed only by the scarcity of men for this kind of work. Pike, Philadelphia, and Cameron are the only counties in the state where farm bureau organization is not a thing of the immediate future. However, there is a great demand in Pike County, and it is possible that there will be a call for a vegetable gardening specialist in Philadelphia County before long.

Last year the extension service enjoyed the most profitable period since it was inaugurated. Projects undertaken by farm agents and college extension men were more extensive and brought better results than ever before. The first county agent went out in 1912, and since that time the steady increase in crop production, stock raising and farming methods backed largely by the extensive research at the State College agricultural experiment station has done much to raise Pennsylvania's agricultural standing from sixteenth to seventh.

TYPES OF RODENT INJURY

(Photos by J. S. Houser.)

(From left to right) Nos. 1 and 2.—Fifteen-year-old apple trees girdled by mice. Note depth of injury. Nos. 3 and 4.—Seven-year-old apple trees girdled by wood-chucks in early spring. No. 5.—The mice found the crack where the protector had been spread thru accident and nearly girdled the tree. No. 6.—Growing grass and weeds forced the protector up and the mice entered below, completely girdling the tree. The protectors should be examined at the approach of winter and settled if they have become forced out of place.

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

INVISIBLE CANNIBALS IN THE SOIL

The investigations of the last twenty-five years have taught us much about soil bacteria. They have shown that the surface soil is inhabited by vast numbers of invisible organisms, present to the extent of 10, 20 or even 50 millions in a thimbleful of soil. There are many different kinds among the invisible inhabitants of tillable land. They vary in size, shape and in the nature of the chemical changes produced by them. Many of the common species of soil bacteria are about 1-25000 of an inch long and about half as wide. In other words, 25,000 of these organisms placed end to end will represent a total length of one inch. Not a few of the species are much smaller. Not a few of them are much larger. In other words, even among these invisible soil organisms there are, relatively speaking, pigmies and giants.

The invisible life in the soil is the machinery, as it were, for keeping the plant-food capital of the land in a liquid state. In one sense soil bacteria may be called manufacturing chemists. They break down the dead tissues of plants, insects and animals: they make ammonia, nitrates, soluble phosphates, soluble potash salts, soluble lime compounds, etc. Certain kinds of these invisible chemists manufacture compounds of nitrogen, which they take from the soil air and cause it to combine with other elements. Living in the roots of legumes or directly in the soil, they help to maintain the nitrogen supply of the earth's surface. But, while they help to produce soluble food for crops, they also compete to a certain extent with higher plants by using up ammonia, nitrates, phosphates, potash salts, lime, etc., for the building of their bodies. When the soil is in a normal condition for plant growth, the amount of soluble plant food produced by soil bacteria and other invisible soil organisms is far in excess of that which is changed by them into insoluble forms.

Rich soils are usually rich in bacteria. Poor soils are poor in bacteria. Everything which makes for the rapid multiplication of the desirable soil bacteria also makes for the rapid production of available plant-food. Hence, it may be said that, in so far as the soil is made congenial for the activities of bacteria, it is also made congenial for the growth of plants. On the other hand, everything that checks the activities of soil bacteria checks the formation of available plant-food.

Among the invisible inhabitants of the soil there are organisms known as protozoa. These are relatively much larger than the bacteria themselves—some times 50 or 100 times as large. They prey upon the soil bacteria and eat up many thousands of them. When conditions are favorable for the activities of the protozoa large numbers of bacteria are destroyed by them. Their number is held in check and, for this reason, the production of available plantfood is retarded. It has been suggested by certain soil investigators, especially those at the Rothamsted Experiment Station in England, that protozoa seriously interfere with crop production because they seriously interfere with the activities of soil bacteria. This view is not accepted by all soil investigators. It is held by the opponents of this view that protozoa are not numerous or very active in normal soils in the field, even though they admit that in sewage polluted soils or in greenhouse soils well supplied with humus and moisture protozoa may seriously hamper the activities of the useful bacteria. Those who support the claim that protozoa are an important factor in soil fertility point out that, when soil is partially sterilized by heat or is treated with poisons like chloroform, ether, carbon bisulphide, alcohol, etc.,

there is at first a very drastic reduction in the numbers of soil bacteria, but, as the soil cools or as the poisons gradually disappear, the bacteria again increase in numbers to a point very much beyond the numbers contained in normal soils. Such partially sterilized soils may gradually increase the numbers of their bacteria to 10, 50 or even 100 times the numbers found in ordinary soils. It is therefore claimed that the protozoa, being more easily killed by heat or poisons, are eliminated by the partial sterilization and the bacteria then have a free field for growth and multiplication. Other explanations are given to account for the abnormal increase of bacteria in partially sterilized soils, as, for instance, partial disintegration of soil humus and of other soil constituents by heating or chemicals. Such partial disintegration enables the bacteria to obtain more food and, therefore, to multiply more rapidly. Whatever the true explanation of the abnormal multiplication of bacteria in partially sterilized soils, it is true that such abnormal multiplication not only occurs, but that it is accompanied by an increased productive power of the soil. Hence, considerable attention is now being given by soil investigators to the problem of the invisible soil cannibals and the true part which they may play in the business of crop production.

Tankage as a Fertilizer

Will you tell me thru your fertilizer column whether the following would be a very good fertilizer for corn and oats and how much of same to use. We can buy at home for \$40 per ton

Drilling Ground Bone

tankage made from dead animals, cut up and put thru a steam jacket tank and then dried and later ground fine enough to go thru the grain drill. J. L. B., Westmoreland Co., Pa.

J. L. B., Westmoreland Co., Pa.—The tankage referred to in your letter will contain 6 to 9 per cent of nitrogen and 13 to 7 per cent of phosphoric acid. The tankage that contains the higher proportion of nitrogen contains the smaller proportion of phosphoric acid and vice versa. It may be safe to assume that most of the lots of tankage which you could buy at the price quoted would contain about 7 per cent of nitrogen and 9 per cent of phosphoric acid. This in itself would make a fairly good fertilizer for oats, corn and grass. However, it would pay to modify it by the addition of other materials. The following mixture may be suggested:

Tankage	1000 lbs.
Acid Phosphate	500 lbs.
Nitrate of Soda	200 lbs.
Muriate of Potash	100 lbs.

This may be used for oats at the rate of about 200 to 300 pounds per acre and for corn and grass at the rate of 300 to 500 pounds per acre.

Poultry Manure and Ashes

Will you please give me some advice as to the mixing of fertilizer. I want to mix ashes, hen manure, nitrate of soda and sixteen per cent phosphoric acid together. I am told that by putting ashes with the other things the ashes will

drive the strength from them. What is your idea about it?—E. W. W., Morgan Co., W. Va.

E. W. W.—It is true that the use of ashes with hen manure is objectionable. The ashes, being caustic in character, tend to drive off a considerable proportion of the ammonia from the hen manure. On the other hand, there is no such objection to the mixing of hen manure either with nitrate of soda or acid phosphate.

It is estimated that 1000 pounds of live weight of poultry will produce daily 30 to 40 pounds of droppings containing 50 to 60 per cent of moisture. Fresh droppings contain on the average about 50 per cent of moisture and 0.92 per cent of nitrogen, 0.62 per cent phosphoric acid and 0.30 per cent of potash. There is, however, a very considerable range in the composition of poultry manure, due to the nature of the food used as well as the age of the birds. The nitrogen in fresh poultry manure will vary from about 0.75 to 1 per cent; phosphoric acid from 0.25 to nearly 1 per cent, and potash from less than 0.2 to near 0.5 per cent. Thoroughly dried poultry manure is more consistent in composition. It will contain on the average 7 to 10 per cent of moisture, about 1.75 per cent of nitrogen, about 2.0 per cent or somewhat less of phosphoric acid and about 1 per cent of potash.

A mixture made up of dried poultry manure, 1000 pounds; acid phosphate, 500 pounds; nitrate of soda, 400 pounds, and muriate of potash, 100 pounds, would correspond to the formula of 4-5-3. That is, it would contain 4 per cent of nitrogen, 5 per cent of phosphoric acid and 3 per cent of potash.

Where wood ashes are available, it would not be necessary to use muriate of potash. In that case, the mixture should contain 600 instead of 500 pounds of acid phosphate and no muriate of potash. To avoid the loss of ammonia, the ashes should be applied by themselves.

Should you find it desirable to reinforce fresh droppings with phosphoric acid and potash, it would be well to make up a mixture consisting of 400 pounds of acid phosphate and 100 pounds of muriate of potash, or a total of 500 pounds. One part of this material can be used to 20 parts of fresh droppings as they are being removed from the dropping boards. The fresh poultry manure thus reinforced may be applied direct at the rate of three to five tons per acre.—J. G. Lipman.

HESSIAN FLY OUTBREAK EXPECTED

The Hessian fly is dangerously abundant thruout much of the winter wheat belt at present. Only the greatest effort continued thruout the approaching spring, summer and early fall will prevent a great outbreak from starting in the wheat to be planted next fall.

The peculiar and unusual weather conditions prevailing in much of the winter-wheat belt last summer and fall are believed to have been largely responsible for the present abundance of the pest in some parts of the country. Conditions east of the Appalachian Mountains seem to be most threatening. Heavy infestation is present on the eastern shore of Maryland and Delaware and in the counties in Maryland and Pennsylvania bordering the interstate line. Infestation in these counties is more general and heavier than has been the case for many years.

There is little that can be done to save a crop of wheat when once it has become infested with the Hessian fly, because the most efficient measures to be taken against it are preventive in character, and must be carried out during the late summer and early fall. It will pay this year, however, for growers in the Eastern States to plow under any heavily infested wheat stubble directly after harvest, especially where grasses, clover, or other forage crops have not been sown with the wheat. In the case of wheat fields that have been killed out during the winter by the Hessian fly, these should be plowed down not later than April 1, where practicable. This destroys the flies before they have emerged, and prevents them from depositing eggs on the grain.

The Farmer and the Middleman

By R. G. KIRBY

Attention Farmers!

The Old Way:

And you know not when. Can you recall the above situation?

The New Way:

We are equipped with TRIPLE AIRLESS TIRES—The tire without a tube. The tire that knows no trouble, and we get double the mileage. No expense, or repair bills.

CROWN GRAIN DRILLS

Big Reduction in Prices of Crown Grain Drills

Take advantage of the large price reduction on the CROWN Line of Grain Drills and Lime Sowers. We are giving the farmers every advantage in the cost of our line for the Spring Season.

New Needham Crown Drills are equipped with the improved Wizard fertilizer feed. This feed makes the farmer's Crown Grain Drill makes the New Drill the best in the market today.

Crown Mfg. Co.
30 Wayne St.
PHELPS, NEW YORK

We also make Cider Mills. Write us for catalog.

STRAWBERRY PLANTS

Good, strong, well rooted plants at \$4 and \$5 per thousand. Also a complete line of the best red and white raspberries, hardy blackberries, fancy gooseberries and currants. A large stock of popular grape vines. Many of our customers are making from \$100 to \$1200 per acre growing berries from our fruit plants. Send for our free catalog.

Bridgman Nursery Co., Box 9, Bridgman, Mich.

CLEVELAND - AKRON FARMS

Farms, 5 acres and up, \$75 to \$125 per acre, 200 Acres on improved road with stock, crops, cows, fruit, etc. \$25,000. Terms: Good buildings, 8 1/2-trail cattle, four extra good horses, all harness, etc. 15 Acres wheat, 50 acres hay, all fruit. \$25,000. Post office: Three-fourths mile from railroad station.

THE CODDING-BAGLEY-CASE CO., Medina, Ohio

Potatoes: Cobbler, Beauty, Boyce, Colon, Carmen, etc. \$1.00 per bushel. Also: Golden Wonder, etc. \$1.00 per bushel. Write: C.W. Fisher, N.Y.

HAY

H W. D. POWER & CO., 601 W. 33 St., New York

A are the largest handlers of commission hay in greater New York. If you have hay to dispose of communicate with them.

HAY

TELL the advertiser you saw adv. in Pennsylvania Farmer.

IN SELLING various kinds of farm produce I am coming more and more to appreciate the fact that the middleman performs a certain service which is necessary. At the same time there are many opportunities to dispense with his services if the producer has the time and the inclination to do it. Middlemen would not last long if they did not perform a service for which the public is willing to pay. When we avoid patronizing middlemen we find right away that our work of marketing increases. Whether the increased profit pays for the increased work is a problem that individual farmers have to solve for themselves.

Here are some ways that we have sold direct with good results. Veal calves have been butchered at home and sold dressed both to restaurant proprietors and to local dealers. This cut the cattle buyer out of the transaction and the calves did not have to be shipped. We obtained the tongue and heart and about three dollars more per calf than we would have received if the calf had been sold to a stock buyer. Such a buyer is often a useful middleman because many farmers do not have time to dress calves. It is not the most pleasant piece of work, and may be worth all a middleman would charge for it.

In selling red raspberries direct we have had good success. Buyers have driven out in their cars and bought by the crate. They have told friends and this has brought more orders. We have sold full boxes of clean firm fruit and received more per box than any dealers would pay. Next year a lot of our customers of last year will be back for more berries at canning time. It saves driving to town with berry crates and possibly canvassing for orders. With raspberries we have substituted ourselves for the middleman with good results.

But even here the middleman has a place. If we should have more berries than customers would drive out to obtain, we would sell to dealers and let them perform a service for us. We would not have time to peddle fruit from house to house by the box.

Dealers perform a service in the handling of eggs. So many producers are located miles from a large market center, and egg buyers have frequently formed the habit of buying eggs one dozen at a time. A farmer cannot afford to use his time in delivering small orders of eggs. He must sell by the crate to the middleman and allow him to perform the service of delivering the eggs to the buyers. If it were not for the cold storage business the egg business would be more risky than at present. When properly conducted the cold storage business is of benefit to both the producer and the consumer.

If eggs could not be stored there would be such a surplus in the spring that eggs would sell at very low prices and in the winter there would be few eggs for sale. The storage of eggs helps to divide up the supply and make eggs available even to consumers of moderate means at all times of the year. Farmers may some day be able to store their own eggs on a co-operative basis and thus perform the service of a middleman. It would be a very profitable business if properly managed. We find that dressed poultry sold

direct to the consumer more profitable than to dealers. The sales must be combined with other products. The farmer cannot afford to deliver one chicken if it takes time from other work. But dressed fowls can be delivered to regular egg customers. I mean the kind of customers that take from five to ten dozen a week so they are worth visiting.

But the farmer with a large amount of poultry meat for sale must depend upon the middleman unless he is close to a good city. For example, the small town trade cannot absorb many broilers. It takes time to dress them during the summer when other work is pressing. In such cases the farmer can often afford to sell the broilers live weight to the local dealer or commission man in a large market city. They take the birds and pay cash and place them where they are needed. I know from experience that this is a service of value during the summer when there are many crates of surplus cockerels to turn into money. A poultryman with several hundred of them often needs reliable agents in the market centers to sell the goods.

It is popular to kick about middlemen and sometimes we find out that they have made more profit on certain deals with us than we can make ourselves. Then a producer begins to look around and try to eliminate his agent. But very often he finds that there are not enough working hours in 24 to do all the things that must be done. It is then necessary to employ middlemen to help out with the marketing. Personally I believe that marketing conditions are going to be better in the future. Farmers are learning to patronize the honest dealers who try to do good work and the crooked dealers are soon spotted and given the kind of publicity that puts them out of business. I believe that most of the unnecessary middlemen are going to eliminate themselves while those that perform a service will remain for a long time.

The mode of life of many city dwellers makes middlemen a necessity. They buy in small quantities and live in houses lacking cellars or other storage rooms. The city flat dwellers seldom buy bushels of food at one time. He orders little bags of this and that over the phone and they have to be delivered by the middleman. A campaign to induce people to buy crops in season and store them would help to reduce their cost of living and also help the producer to place a large amount of food shortly after harvest. Farmers know that all the food they hold over winter in storage is not held from choice. They would much prefer to get their money out of most of it in the fall. City consumers often think that farmers only store food to get higher prices. Many producers would be satisfied with small profits if they could get their money in the fall. Here is a chance for the consumers to eliminate a middleman and store potatoes, eggs, cabbages, onions and other fruits and vegetables of their own use.

If the farmer is to serve as a middleman he must receive co-operation from the consumer. If the buyers wish to buy of middlemen because they can give extra fine and prompt service, then the farmer will have to sell to the middlemen. Often a high-class grocer can be a fine friend to a farm producer.

UNADILLA SILOS

The reason why the Unadilla sells two for one of any other silo in the East is because its patented construction keeps silage best and provides the easiest, safest, most economical way of storing and using silage.

The Unadilla door cannot stick or freeze in—it is opened automatically by simply raising the fastener, and gives a continuous opening through which the silage is shoveled, saving the heavy work of pitching overhead. These fasteners are also the ruins of the famous Unadilla door-front ladder—as easy and safe to climb as a stairway. Blows are easily, safely adjustable from this ladder, keeping the silo always in prime condition.

Hubam—

The Most Promising Legume Introduced in Recent Years

This new Annual White Sweet Clover has been acclaimed by authorities as the greatest of all annual legumes. It has shown six times the growth of medium red clover, and promises to save a year in crop rotation in the corn belt. Grows 5 to 8 feet same season sown. Early maturity. Greatest forage and green manure crop ever discovered. Grows well in any climate.

The Supply Is Very Short
There is but a very little Hubam available for distribution, and now is your chance to get in on the ground floor. 1 to 1½ pounds only required per acre for seed production.

We have a limited amount to offer, cleaned, sealed and certified by the Michigan Crop Improvement Association. To be released only for demonstration purposes in lots of 1 pound or less.

\$7 per pound, \$4 per ½, \$2.25 per ¼.

TEAMWORK ESSENTIAL IN FATHER & SON PARTNERSHIP

The article B. A. Farmer and Son, in a recent issue of the Pennsylvania Farmer, was very interesting, and illuminating, as regards to the proportion of partnerships between fathers and sons.

It is an inspiration to see a father and his son, or sons, succeeding as partners and the tendency towards such partnerships argues well for the future of American agriculture.

However, some fundamental traits of human nature should be well considered in the formation of such partnerships. There must be a perfect seal of confidence between father and son. Fairness and tact must rule in all things, for a partnership between father and son, even the financially successful, can be anything but pleasant and cordial.

The farmer must be willing to allow the son, or sons, a voice in the formulation of the farm policy and in planning the farm management. Make the boy financially independent either by cash settlements at stipulated periods or by a joint bank account on which either may check. I consider the latter preferable. And in general he should recognize the sons' rights and talents as he would a partner's from outside his own family. There should be signed articles of agreement.

The son, of course, must be capable and trustworthy. Perfectly competent to assume entire charge in case of need, and ready to meet any emergency, or to shoulder any responsibility. He must have respect for the Senior Partner's more mature judgment and riper experience.

Both father and son must be willing to try and see both sides of any problem that will arise; for it is inevitable that differences of opinion will occur and it is essential that they may be discussed and settled with fairness and an absence of rancor.

As little flaws will mar the finest workmanship so petty bickerings will disrupt the finest organization. The person pronoun "I" must be superseded by the plural "we" and "mine" must be changed to "ours."

I know of a partnership that is far from satisfactory just on account of the unwillingness of the father to relinquish his arbitrary control. He cannot give up "I" and "mine." The junior partner has no say in the money matters whatever.

Another incident, in this same partnership, will show how trivial things can ruffle a smooth current. This young man had long cherished the creditable ambition to have his name on the farm stationery, along with his fathers. An agreement of partnership finally being consummated it seemed that his ambition was about to be realized but when the next lot of letterheads was delivered by the printer the father's name alone appeared on the letterhead. Imagine the disappointment and bitterness of the junior partner and the moral effect. The father never knew of the incident and never will and, incidentally, the father's name is still on the letterhead, alone.

Result: the son is still planning for that letter head with "Father & Son" on it but it will be His Son and He will be the Father.

I am not aiming to air my troubles in this article and am writing with the sincere hope this may show the light to some who may need it; for I must confess that I am the above mentioned disappointed—Junior Partner.

Kodak as you go.

There's always more fun with a Kodak along. It adds to the joy of every motor trip and keeps for your Kodak album the story of every merry outing.

Picture taking by the Kodak system is very simple now-a-days and less expensive than you think.

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.

—The Editors

Granted sincerity of purpose, the great powers of the world should find no insurmountable difficulty in reaching an agreement which would put an end to the present costly and extravagant expenditure on naval armaments.

—Theodore Roosevelt.

State Fair Bill Hearing

A HEARING on the State Fair Bill was held by the Appropriation Committee on Wednesday of last week. The proponents of the bill represented nearly every branch of agriculture and stock raising in the state, and representatives of the State Chamber of Commerce and the State Bankers' Association were also present and urged the establishment of a state fair. Seldom have we seen a gathering of the varied industries of the state so unanimous in their agreement of any project. Every line of production and commerce realizes the great value of an adequate state exhibit where the products of the state may be brought together for the mutual help and enlightenment of the people. It is the cap-sheaf needed to complete the great educational institutions of the state. The opponents of the bill, chiefly the members of the County Fair Association, did not offer any opposition, but have asked for another hearing at which to voice their objection.

Save the Quail

THERE IS urgent need for farmers and lovers of bird life in general to come to the immediate support of the bill to put the quail on the list of song birds and thus have it perpetually protected by law. There is little doubt but what it would be passed by the Legislature if reported out of committee, but it is being held there thru the influence of sportsmen and the State Game Commissioner and unless the public brings a strong pressure to bear upon the House Committee on Game the bill will die in committee. A hearing has been called for April 5, at 2 o'clock at the Capital and every interested person should attend. If impossible to attend, write a letter to Hon. Charles W. Catlin, Chairman Game Committee, Harrisburg, Pa., demanding that the bill to protect quail be reported out of committee. DO IT TODAY.

Aside from all sentimental reasons for preserving the life of the quail, the economic reasons should be sufficient to cause every sensible person to use his influence to have this bird protected from the hunter's gun. The quail is the farmer's and fruit grower's greatest natural aid in fighting insects and the spread of noxious weed seeds. No other bird subsists so entirely upon insects and weed seeds. The quail is not

Pennsylvania Farmer

a migratory bird and the rigorous winters of our section are sufficient to keep its increase undeniably low without slaughtering it.

We have no wish to engender any ill-feeling between sportsmen and farmers and there will be none so long as hunters show a proper regard for the rights and welfare of farmers, but in regard to the bill in question sportsmen should remember that farmers and land owners could if they would protect not only quail but all other game upon private land within the state by posting it against trespass. We would not urge the general practice of this legal right except as a last resort.

Export Figures

WHILE there has been a gradual falling off in the export trade during the past few months it must be remembered that the reduction in volume is not so great as it appears. The figures usually printed are in dollars representing the value and it must be remembered that prices per unit are materially lower than those of a year ago. In February, 1920, the exports of cottonseed oil amounted to \$4,515,000 and in February, 1921, 19,000,000 pounds more was exported but the value was \$200,000 less. In a measure the same thing holds true of meat and breadstuffs. The exception to the general rule is in mineral oils of which the amount exported increased 13 per cent while the value increased 36 per cent. If one is to form a correct judgement of the export trade today in comparison with that of 1920 and before, he must take into account the reduction in prices.

However, trade is falling off and the necessity for developing foreign commerce anew is engaging the earnest attention of business men and statesmen. There is a very general discussion of means for establishing some kind of trading with Russia and the central countries of Europe. One of the most perplexing problems is that of insuring payment for goods sold in those countries. There is no question but what the return of normal times and full production in this country is dependent to a great extent upon a resumption of normal relations with foreign markets. We have the equipment for producing more in every line than can be absorbed at home and hence talk of closing our markets to foreign trade is absurd. Some regulation of such trade, however, is necessary but the terms of regulation must treat all industries alike.

Business Conditions

THE GENERAL improvement in business which all hoped would take place in March did not materialize. Of course, seasonal buying increased trade to some extent over that done in the first two months of the year, but it was far below the usual March business. Dealers and merchants are endeavoring to reduce their stocks but are not inclined to place new orders until buying becomes more brisk, while, on the other hand, buyers are evidently holding off until prices are further reduced. All this in turn tends to slow down or stop industry, and consequently the buying power of the public is gradually reduced. In almost every line buyers are not inclined to buy beyond immediate necessities. There is nothing organically wrong, as a physician would say, with the economic system. Failures are few and financial institutions are strong. We may carry the simile a little farther, however, and say there is a general feeling of lassitude superinduced by weak heart action.

Probably one of the greatest causes of hesitancy in the resumption of industry is that of wages. It is claimed that it is impossible to operate productive industries at present price levels and market conditions and pay old-time wages. In some industries there has been an amicable adjustment of the wage question while in others the workers are unwilling to make a scale to fit the new conditions. In two fundamental lines, coal mining and transportation, the hitch in adjustment is retarding nearly all other industries.

Reports indicate that in spite of much newspaper talk about the threat of farmers to reduce production about the normal acreage will be planted. The farmer cannot seriously interrupt

the rotations and system of his farm without serious loss. Wages for farm work have fallen from 20 to 50 per cent from those of last year in all parts of the country. Feed prices are much lower and there has been a general reduction in the price of farm machinery. Fertilizers, also, are tending downward.

Our Washington Letter

As a result of the get-together movement that has been promoted in Washington, the executive committees of seven leading farmers' organizations will hold a conference at the Harrington Hotel in this city on April 14th, for the purpose of formulating a legislative program to which all of these organizations can subscribe. It is believed that all seven associations can agree in support of the truth in fabric, cold storage, Muscle Shoals nitrate plant development, farmers' collective bargaining, and packer control legislation, and on the more important items in the tariff schedules.

After the various items have been unanimously agreed upon an affirmative statement will be issued declaring that the seven organizations are in complete accord on these points and a united presentation of the legislative program will be made in Congress. The National Grange, American Farm Bureau Federation and National Milk Producers' Federation are among the seven cooperating organizations. Heretofore there has been some team work along general lines among the various organizations in the Congressional hearings, yet differences in views and minor points have had a tendency to weaken the farmers' case. This move is believed to be the most important advance step taken by the farmers' organizations in a long time.

Senator George W. Norris, of Nebraska, has been made chairman of the Senate Committee on Agriculture. There was considerable opposition to Senator Norris on the part of ultra conservatives because of his so-called radical views on certain economic questions. His appointment, however, will please the progressive element of the Middle West. Senator Page, who was ranking member of the committee on agriculture, retains his place at the head of the committee on Naval Affairs, and Senator Kellogg of Minnesota is placed on the Foreign Relations Committee.

Senator Arthur Capper of Kansas says that there is evidently a misunderstanding prevalent in some sections of the grain belt as to the purpose of the Capper, Tinscher and other bills designed to regulate the boards of trade and grain exchanges. He says there is no intention on the part of those promoting these bills to entirely do away with hedging. These bills do not provide for the elimination of hedging, but aim to cut out the evils of hedging. Until a better system is devised, it is thought best to preserve the legitimate functions of the hedge. The records show that 95 per cent of the transactions in futures on the grain market are for gambling purposes only, with no intention of buying or selling the grain, and this is the evil that does the damage to the producers.

A new farmers' collective bargaining bill is being drafted with the aid of specialists in market co-operation in the employ of the farm organizations. Senator Capper says the bill will be introduced early next month and he thinks it will get thru Congress with the united backing of the organized farmers.

With more than fifteen billions of dollars to be raised by the government during the next three years, tax legislation is certain to be in the forefront of Congressional discussion this spring. The March installments of the income tax will be more than \$600,000,000, exceeding the Treasury Department estimates, nevertheless they are \$300,000,000 less than last year, and the belief is current that the heavy decline in the earnings of corporations and individuals the past year, will be responsible for a corresponding decline in revenues from the income tax, and Congress will be compelled to devise some new method of supplementing the present system of raising money for the support of the government. Congressional leaders are now devoting much time to this subject.

It is now definitely settled that the emergency tariff bill vetoed by President Wilson will be re-enacted by Congress just as soon as possible, if the administration leaders have their way. The only change agreed upon is a reduction of the time it will run from ten to six months. This change is made, according to Senator Capper, for the reason that a permanent tariff law will go into effect before the end of the six months. In order to get the emergency tariff thru without delay, Senate leaders have agreed to limit debate.

Following the emergency tariff will come the enactment of an anti-dumping law imposing additional duties upon foreign goods which are brought into this country at prices below the fair value in the exporting country; a law providing for American valuation of imports as a means of eliminating the foreign exchange factor; a permanent tariff bill and permanent revision of the revenue laws.—Elmer E. Reynolds.

April 2, 1921.

April 2, 1921.

HARRISBURG LETTER

The Home Stretch.—The Pennsylvania Legislature is swinging into the last quarter of its 1921 session and the pace is not swift. The results will be mediocre when compared to the last half a dozen sessions and at this point it looks as though a Legislature would repeat what it has often done in the second term of a governor—pass appropriations in excess of the revenues and put it up to the Governor to do the cutting. The problem of this session ever since the program was shelved has been to make a sum go into another sum only two-thirds as big. The lawmakers have been no more successful than a country school boy. Just at this period the appropriations have piled higher than ever and there is a marked inclination not to pass any revenue raising bills and at the same time to avoid reducing any of the state employees or to lop off any of the money voted to charities not under state control. The opportunity presented for financing the state on business lines let slip this year is one such as may not come again in decades. Instead of embracing it the State Administration and the legislators have hustled around seeking new sources of taxation and when they have been found dropping them off like hot pokers and going after something else. With the studies of an expert in economy and government before them they have "played for place" in a way that makes the home stretch of the session a rather sad spectacle.

The Liquor Bills.—The House of Representatives having voted down repeal of the Brooks high license law with search and seizure it will now receive the Governor's bill, which would amend the Brooks law and in opinion of many students of the liquor mess, provide saner provisions than the Martin bill. The administration bill will not want for teeth, but will be along different lines from that defeated. Just what will happen to it with the liquor people flushed with victory where they expected to be defeated and some of the Brooks law repeaters mad enough to vote against anything that would retain any feature of that law is as interesting as to what legislators are going to do about the equal rights bill. This latter measure is a biennial visitor.

Farmers Can Pick Now.—State Employment reports indicate that the farmers of Pennsylvania can pick their employees now. Every state office reports applicants for farm jobs and farmers are selecting the most experienced. They have been able to select those raised on the farm and in some instances have succeeded in getting help at pre-war wages and even having contracts signed, especially where houses have been furnished. And the foreign farmer immigration does not appear to be amounting to so much after all. Will Start the Fair.—While the opposition to a State Fair seems strong enough to prevent voting of the appropriation asked to buy a site it is commonly reported the Legislature will pass an act creating the commission and providing for expenses for inspections and other preliminary matters. This will start the fair, although not the way many people wish.—Hamilton, Harrisburg.

NEW YORK LETTER

Cattle Sell Slowly.—The first day of the big Holstein cattle sale at Liverpool, where 300 choice animals were to be sold, was a little disappointing to breeders. The highest received was \$280, and young stock sold as cheap as \$20. There never was a better time for new beginners to get stocked up with high-class purebred animals than now, it is believed.

Recent Legislation.—After a bitter fight in the Legislature the dry enforcement bills passed both houses, and went to Governor Miller yesterday. The bills place the burden of enforcement on local peace officers. It is felt that with the present extra work ensuing on the crime wave that such enforcement will test the powers of local police to the utmost, but that such enforcement is one of the big needs of the day. One bill will permit recovery of damages from the person selling the liquor if an intoxicated person causes or receives

Pennsylvania Farmer

7-383

injury or accident. Legislation to provide additional state fair buildings will not pass owing to the Governor's economy program.

Sirup Sales.—A good supply of maple sirup has been sold on the Syracuse public market at \$3 a gallon. Other makers in other sections are selling as low as \$2 to grocers and private trade.

State Fair Posts.—Prof. E. S. Savage, of Cornell, will superintend the cattle department at the state fair the coming year, and E. S. Hill, a Peruville farmer, will superintend sheep and swine.

Inside Parleys Closing.—The indoor meetings of the Farm Bureaus are drawing to a close for the year, to give place to outdoor events and demonstrations. Barn and field meetings are being arranged for by the Farm Bureaus of the state. The sheep breeders are to have a new series of meetings, with W. T. Grams of Cornell in charge. The first demonstration flock of sheep ever gathered will be used in the course of a series of barn meetings to teach different things such as the use of purebreds, disease control, feeding, forage and crop rotation, care of wool, etc.

Notable Record.—An Onondaga teacher, Miss Carrie Paddock, is soon to resign, after 48 years of service in the public schools of the city. Like several other highly valued veteran teachers, she is able to call most of the city by their first names, having seen them grow up under her tutelage. The pension given such retiring teachers is one-half the average salary for the last five years.

NEW JERSEY NEWS

Legislature to Adjourn.—The 1921 session of the One Hundred and Forty-fifth Legislature will adjourn sine die on Friday afternoon, April 8, at 3 o'clock. A concurrent resolution introduced in the Senate by Senator William B. Mackay, of Bergen County, majority leader of the Upper House, and passed by that body, and later, presented to the House on motion of Assemblyman Harry T. Rowland, of Camden, majority leader of the Lower House, and adopted by that body, provides for the action. While the appropriation bill, which makes provision for more than \$15,000,000 for the operation of the State Government for the fiscal year beginning on July 1 next, has been favorably acted upon by both of the branches of the Legislature, there is still a mass of several hundred bills not yet acted upon in the Senate and House.

An action of the Senate of much pleasure to the residents of the rural sections of the state was the passage over the veto of the Governor of the Case State Constabulary Bill, providing for a police force to be located in Trenton and to be assigned to any part of New Jersey, where trouble arose necessary for such a force. During the legislative session held on the measure at the State House, recently, the representatives of the agricultural interests spoke strongly in favor of the bill, it being stated that such a policy body would be able to prevent crime in the less populated parts of the state.

Union labor organizations opposed the measure on the ground, that the police were not to be used to aid in the prevention of trouble and the apprehension of criminals but to interfere with workmen on strike. A measure providing for a secret ballot for school elections, and one allowing pensions to county detectives, have also been acted upon favorably by the Upper House, while one that would amend the State Constitution to increase the terms of sheriffs from three to five years.

Despite a fervent appeal made to the members of the House to pass a resolution that would change the death penalty and substitute life imprisonment for murderers, they fought the bill and it was defeated. The House has received a report from a special committee named under a resolution, which has recommended that \$50,000,000 be appropriated for the needs of the State Highway Department and \$14,000,000 for the needs of the Department of Institutions and agencies.—Kelly, Trenton.

Have the Comfort You've Always Wanted

Gives delightful comfort in all rooms for howling winter weather or the dangerous, damp days of changeable spring. Windy weather makes no difference—the heat goes to every room. Most reliable heat there is. Outfit lasts longer than the building. Absolutely safe—no fire risk.

Keeps Them on the Farm

The ARCOLA Heating Outfit warms the home all over for the family and help. It makes farm life just the best life there is. It keeps the young folks on the farm, because it makes home so cozy and cheerful.

Most Heat at Least Cost

Why not find out at once about this small, hot water heating plant for your home? It will give you the greatest comfort at the lowest cost, and relieve you of monotonous drudgery of fussing with stoves, grates, and old-fashioned heating devices.

New Low Prices Now in Effect

The ARCOLA is made for small houses, with or without cellars. Running water not necessary. ARCOLA is placed in any room with a chimney. It heats that room and circulates hot water through small pipes to radiators in the other rooms. Pipes may be run through walls or left exposed, thus helping to warm the rooms. Heats all rooms with one fire. Burns coal or wood—uses less fuel to heat whole house than a stove requires for a few rooms.

Why not Have It NOW?

Find out about the ARCOLA to-day from your local heating dealer. Write for illustrated catalog showing open views of Ideal-ARCOLA Heating Outfits in 4-, 5-, 6- or 7-room houses—also just the thing for chicken and hog houses and garages.

If You Want a Poison That Will Stay On, Use Mechling's Arsenate of Lead

It is made with the special qualities
in view of

**Fineness,
Adhesiveness,
Number of Parti-
cles to the Pound**

Because it is so fine and because it
sticks so evenly it is the ideal lead
arsenate for fruit growers to use.

Modern fruit orcharding requires an
almost continuous coating of poison
on the fruit as it is growing, and
because Mechling's Arsenate of Lead
sticks on so perfectly, it is being de-
manded by progressive orchardists.

HORTICULTURE

Pruning Young Fruit Trees By J. P. STEWART

THIS is the time of year when many farmers and orchardists are making plans for their spring plantings of young trees. One of the questions which always comes up in connection with this work is that of the method of pruning to be followed.

The writer recently had the duty and privilege of supervising and assisting in the planting and pruning of over 26,000 apple and peach trees for one man. This is a matter of little importance except that it made it desirable for us to reconsider the whole field rather carefully, and make sure that our own ideas were fully up to the times and in accord with the best and most recent investigations on the subject. One of the surprising results of this reconsideration was the discovery that very few, even of the professional horticulturists and pomologists, had any apparent acquaintance with the results and conclusions of the principal experimental work that has either been done or is now in progress.

Distributing Lime With the Aid of a Mechanical Spreader Attached to Wagon Box

ress on pruning. As a result, most of their statements and recommendations are now apparently in line with what would have been considered good practice around twelve to fifteen years ago, but most of them totally ignored the important actual results that have been reported by competent investigators since that time. In fact, a rather larger percentage of the best commercial growers have come into line with what should now be considered sound practice, than of the professionals to whom they are supposed to look for advice.

In the past, so many unfounded and often conflicting virtues have been ascribed to pruning, that it may be a hopeless task to attempt any general correction, even if we assumed the ability. But it will probably do no harm to state what we attempted to do in the case above mentioned, and then cite some of the underlying reasons.

In the first place, we aimed to

"head" our peach trees at a height of at least thirty inches, with about a six-inch variation either way depending on the tree, and aimed to save at least five good limbs or buds. The limbs were usually clipped off just beyond their first or second bud in proper locations below the point of heading. This height may seem like rank heresy and a grave mistake to the "low-headed" enthusiasts, who seem to be under the impression that it is necessary to cut the trunk off at about the height really desired for the lowest limb, in order to get a low-headed tree. Their method will get the low head all right, if the stump doesn't die, but it leaves no space for the other limbs to form except below or alongside of what should be the lowest limb, and it is also inevitably seriously reduces the amount of foliage available for growth and roots system formation during the entire first season. It is also likely to develop a very spreading, low-branched, bush form, which is especially objectionable in a "fil-

ling normal trees was made in the trees that were cut back to 36 inches at planting time, while those cut to a height of 18 inches made the least growth. The growth in the higher trees was also usually well distributed. Trees of the smallest caliber—three-eighths of an inch—made good growth when cut as low as 6 inches, but the larger-sized trees were markedly depressed by such cutting. On trees that had been badly dried out before planting, the greatest total growth was made on those cut to 30-inch trunks at planting time. The smaller grades of trees suffered most by drying, but were naturally best adapted to the extremely low heading. Trees of the half-inch grade, cut to 24 inches when set, usually gave trees from which a desirable commercial form could easily be developed.

They also found that one-year-old peach trees of the five-eighths or three-quarter-inch grades usually made the largest average growth, when properly pruned, and that trees in general failed to develop branches well upon the twelve to twenty-four inch section of the trunk, chiefly on account of the usual scarcity of good buds in that section. They conclude that peach trees at planting time should not be pruned to any definite height, regardless of all other factors, but should be pruned somewhat according to grade and the character of the stock, as all trees start into growth best if there are plenty of well-formed buds (or limbs) just below the point of cutting.

Results in New York

The important influence that pruning of the tops exerts in retarding growth is generally overlooked, and has only recently been brought out clearly in experiments by Chandler at Cornell. He not only finds the usual marked reduction in top growth as a result of pruning the tops, but also finds a similar sharp reduction in root growth from the same cause. In one experiment some young apple trees already established in the orchard were left unpruned, "others of the same size had the lower branches removed to a height of about twenty inches, and still others, in addition to this pruning, had most of the branches except the leader shortened back. In this case the root growth of the most severely pruned trees during that summer was but fifty-two per cent of that of the unpruned trees, and the top growth fifty-seven per cent." And this reduction all came from simply pruning the top.

In another case, some four-year-old peach trees were cut back severely in the spring of 1916 and again in the spring of 1917. "At the end of the latter season, when the prunings were added to the weight of the tops, it was found that the top growth had been as great on the pruned as on the unpruned trees. The root growth, however, had been greatly reduced by the pruning, the average root weight of a pruned tree being but twenty-seven pounds as against thirty-seven pounds for the unpruned trees." Since this reduction, moreover, had occurred only in the last two years of a six-year growth period, it appears that the root growth on the pruned trees during these two years was hardly sixty-five per cent of that on the unpruned trees.

Considerable pruning is of course needed on peach trees, after they have become established in the orchard, both to increase their annual twig growth and to keep their bear-

Results at the Jersey Station

In the peach pruning experiments in New Jersey, for example, reported by Blake in 1916, it was found that in general the largest growth

ing wood as low as possible, but it should be clearly noted that the "increased twig growth must always come at the expense of a reduced top."

In the pruning of the apples, in the planting above-mentioned, the central leader type—with three to five side limbs and preferably four—was adopted for several reasons, most of which have already been given in this column. Some of the present conclusions of an interesting test of different forms for the apple, at Cornell, is of interest in this connection, however. In these so-called training experiments, attention has been centered on three forms: "the natural form, where very little pruning is done; the central leader form, whereby pruning back the branches, the growth is directed into the central upright trunk; and an open-head form, where about five branches are permitted to grow, each being trained with a main leader, the upper branch being kept the largest." In Chandler's words, "It has required more pruning to secure this last form than either of the others, the trees have been dwarfed in size, and the fruiting has been rather markedly reduced. It is possible that the latter form may give a better fruiting tree when older; as to this we have no evidence. We can only say that it costs money to get such a form, since the fruiting is reduced during the early life of the tree."

These conclusions are of special interest, in view of the rather wide use of this type during the last twenty years in the commercial sections of Southern Pennsylvania. In that section, however, at least some of the larger growers are not especially pleased even with the ultimate fruiting form which this type of tree produces.

REPAIRING THE FENCES

The pasture fence must be renewed before the rush of spring work comes. While cutting timber and firewood the last two or three years we have accumulated more than three hundred posts 6½ feet long. We have no cedar or locust (wish we did) but chestnut and white oak will last many years. Pin oak, maple, elm, gum, ash, beach, birch, etc., do not last when used for posts. Our posts are stacked near the pasture ready when needed.

We tried to get six spools of barbed wire at our local hardware stores. However, they did not have it in stock or if they did they wanted a profit on the excessive prices they paid last year. Therefore, we got into communication with a fence company that advertises in this paper. They are to furnish the wire at once at a newly adjusted price. Soon it will be in our barn ready to be used when we are ready for it. Badly rusted wire and weak posts will be eliminated without hesitation. It is exceedingly expensive "reaction" to chase the cows which are sure to get out thru weak fences just when we are in our busiest days. —R. W. DeBaun.

THAT CHEERY "HELLO"

"Stop a minute and say 'Hello.' As down Life's road you smoothly go, For a pleasant word and a cheery smile Will shorten the road for many a mile For some poor brother who is going slow, So stop a minute and say 'Hello.'"

**TORO
Cultivator**

FAST WORK AT LOW COST

That is the kind of performance obtained
throughout the United States by TORO owners

To get over your fields quickly, thoroughly, and at small expense use a TORO. This light, compact motor cultivator is enabling owners to raise crops at a larger profit than ever before. It is a fast and tireless worker which cultivates more in a day than can be done with two men and four horses.

For a thorough, first-class job of cultivating

The TORO is the only power cultivator made which steers by the front driving wheels. Without this feature it would be impossible to do a thorough job of cultivating. On the TORO the drive wheels respond immediately to the steering wheel, causing instant action of the gangs. This means the greatest possible flexibility in the field, and permits cultivating row crops in uneven hills with ease. You can work fast, steadily and carefully with the TORO. But cultivating is not the only job this dependable machine is doing on hundreds of farms every day. The kind of service TORO owners are obtaining is summed up by Warren Fiscal of Yale, Iowa. Mr. Fiscal writes, "As I have used one of your motor cultivators for a little over a year,

I feel able to give a few of the things it will do. "I have used it to drag roads, cut outs, haul manure, make hay (pulling a hay loader behind), disc, harrow, cultivate, and stir plow. I have pulled a common horse drawn sulky (16-inch) behind the cultivator, turning twenty inches, seven inches deep with perfect ease.

"In cultivating I can plow as much in one day as a man and single row horse-drawn cultivator can in three (and do just as good a job as any man can do) on half of what it costs to keep horses to do the same work and it is so easy to operate that a little ten year old boy can operate one of them just as well as an older man. "I cannot say enough about this machine, so if anyone wants to know what I know about this wonderful little machine, just have him write and ask me."

Two Machines With One Power Plant

With the addition of a few extra parts the TORO Cultivator can be readily changed into a two-plow tractor. This big exclusive advantage gives you two motor driven machines with one power plant.

With this feature the TORO displaces horses for more jobs than any other tractor made. To make the change from cultivator to tractor, is a simple, monkey-wrench job. Sold either as a cultivator or a tractor, with or without the parts to change from one to the other. The TORO completes the motorization of the farm.

**TORO
Tractor**

Cut the Cost of Crop Production

The TORO is a big factor in reducing crop-raising costs on thousands of farms. Learn what it will do for you. Our catalog describes and illustrates every detail of this reliable cultivator-tractor. Write today.

A De Laval will bring prosperity to your farm

A De Laval Cream Separator saves and serves twice a day, every day in the year. It is the producer of a steady, never-failing cash income during every month regardless of season or weather.

Its saving of butter-fat alone is so great that the De Laval pays for itself in a short time and then the extra profit is yours—to provide more comforts and conveniences, to buy new stock or equipment, or to save.

The De Laval Separator eliminates the drudgery of gravity skimming. It saves the cream wasted by an inefficient separator, and it lasts a lifetime. It is the most economical separator to buy. That's why there are more than 2,500,000 De Laval's in daily use.

See your De Laval Agent now about getting a new De Laval.

Helps on Raising Dairy Calves

By MELVILLE WETTACH

THE raising of dairy calves is a subject of importance to all dairymen, particularly if one is raising purebred stock. Owing to the scarcity of good cows, dairymen are taking a risk when buying cows, and if the farmer can get good ones, he pays a high price for them. Raising heifer calves from his own herd will not only save the farmer money, but it will also prevent the introduction of contagious diseases into his herd from outside sources. By raising the heifer calves of good ancestry, he improves the quality and the market value of his herd and increases the herd's production of milk and butterfat.

Feeding

The calf should be allowed to remain with the cow for the first few days in order to secure the colostrum milk which starts the digestive processes. After the calf is two or three days old it may be taken from the cow and put in a pen with a few other calves.

A Calf Which Weighed 142 Pounds at Birth. Owned by the Pennsylvania State College

It is useless to try to teach the calf to drink unless it is hungry. Coaxing the calf ten or twelve hours after it has been taken from its mother, by letting it suck one's fingers and gradually leading its head into a pail, is the best method of teaching to drink. Ordinarily the calf only has to be coaxed a few times in this manner before it learns to drink with little difficulty.

The young calf should be fed from two to five pounds of its dam's milk three times a day. It is better to feed four times a day if the calf is weak. Remember that there is more danger from overfeeding than from underfeeding.

When the calf is three weeks old, skimmed milk may be substituted at the rate of one pound of skimmed milk per eight pounds of live weight for the larger breeds and one pound of skimmed milk per ten pounds of live weight for the Island breeds. As in the feeding of whole milk, the utensils must be kept thoroughly clean and

washed and scalded after each feeding. Do not feed the foam off of separator milk as this will cause the calves to bloat and scour. Increase the amount of skimmed milk gradually and if plenty is available, it may be kept up after the calf is six months old. To get the best returns it is not advisable to feed over twenty pounds a day. Do not over-feed on skimmed milk believing that it is "thin." Skimmed milk is a nutritious feed and will surely cause trouble if fed in too large quantities. Feed more according to the capacity and condition of the individual.

There are numerous "skimmed milk substitutes" on the market and the following is as good as any. It is known as the "Purdue Mixture" and consists of equal parts by weight of hominy feed, red dog flour, linseed meal and dried blood. This must be thoroughly mixed and this is best done by mixing in small quantities. One pound of the dry calf meal is substituted for nine pounds of the skimmed milk or about four and one-half

their packing, it is better to mix them with some other feed. Bran alone is a starvation diet. Another satisfactory ration is one composed of five parts of ground oats, three parts of wheat bran and one part of each corn meal and linseed oil meal. Linseed meal has a tendency towards causing scours and it is best not to include it in the ration of very young calves and those that are scouring. Corn products, except corn gluten which is too concentrated, are good feeds for calves. There is no danger from overfeeding with grain; give them all that they will clean up. Keep the feed box renewed with fresh feed, but in such amounts that the last feed is always cleaned up before fresh feed is put into the box. Never feed any stale, wet, musty or mouldy feed as this will cause indigestion.

Hay may be fed when the calves are ten days or two weeks old. Feed in small quantities at first (especially alfalfa), and only give them good, clean, fresh hay until they are ten weeks old. After that age they will eat any kind of hay with no bad results. The hay should be fed in a rack so that the calves will not waste it by tramping down.

Milk and grain are not all that a calf needs. Many believe that, since skimmed milk is fed there is no need for water. This is untrue, particularly in the summer months. In the winter they will not drink as much but they should have the opportunity to do so. They should have plenty of fresh, clean water each day after they are two weeks old. On hot summer days, calves under six months should not be fed large amounts of water in the middle of the day. When the weather is so hot that they pant, there is danger from apoplexy if they are given a quantity of water. It is better to water them in the morning and afternoon when they are out in the hot sun all day.

Salt is necessary for a calf that is consuming roughage and it should be supplied daily, usually with the grain feed.

Whey, buttermilk and sour cream should not be fed to calves under four months old. Oil meal makes a good feed for older calves provided there is scouring. Wet alfalfa is a bad feed for calves as it causes bloat. Calves over four months may be fed fresh cow's milk, boiled, but it should be fed in limited quantities and only when sweet to younger calves. Flaxseed should not be fed as it will cause scours.

(Continued Next Week).

"For sale," read the advertisement in the local paper, "a cow that gives ten quarts of milk a day besides two grandstones, a lot of farm tools and a set of harness."

"We've had a mighty dry summer," said the Senator from Minnesota, who was exhibiting at the National.

"Dry summer?" asked Falfurrias El, who lives in the State of Texas. "Man, you ought to come down to my country. Why, we have bullfrogs down there eight years old that haven't learned to swim yet!"

Corn variety demonstrations conducted under the supervision of agricultural extension representatives of the Penna. State College during the 1920 season show that a general planting of the best varieties would increase the average corn yield of Pennsylvania by seventeen bushels per acre.

Double the Life

of your farm buildings by keeping them painted. Lumber and carpenters cost infinitely more than good paint. Paint not only lengthens the lifetime but adds 100 per cent. to the appearance.

TALKS WITH THE BOYS

EDITOR'S LETTER

To the Boys:

Boys, what are you doing? You may think this a strange question to ask but that is just what we all want to know about each other. Some of you live in New York State and some in Maryland, some in New Jersey and some in Pennsylvania and other states. You are all living under different conditions and I know that you are all interested in each other for if you were not you would not be reading this page. What worth-while thing are you doing that you think other boys would be interested in hearing about or learning to do? Tell us about them.

Perhaps you have noticed that many of the letters that have been printed on this page have been much alike. That is not because those of you who have written have tried to get ideas from each other's letters but because you were afraid that we would not all be interested in what you were doing. I am not saying this to find fault with any of the letters that have been printed but simply to suggest that you all tell more about what you are doing and reading and thinking. Have you taken a hike to some interesting place near your home? Are you planning a baseball team for this season, are you in any boys' clubs, are you having any success with your bird houses, have you built any useful article for yourself, have you thought of anything that you could do that would please Dad or make Mother's work any easier? Write us about these things as well as the hundreds of other things that we are all interested in. Don't think because you do something or see something useful or interesting every day until it becomes tiresome that the rest of us would not like to hear about it.

Every boy who reads this page can write a letter that will be helpful and interesting to every other reader, whether young or old. We know that, for the grown-ups as well as the boys have been writing to tell us how they enjoyed the letters.

Now, let's all do our best to make this page really worth while. It is all yours so the whole thing is up to you. You have made a fine start. Let's keep on improving and try to make each page a little better than the last one.

*Sincerely,
The Editor*

LETTERS FROM THE BOYS

Dear Editor—I am glad the Pennsylvania Farmer is having a Boys' Department. We have been getting the Pennsylvania Farmer for about two or three years and all of us think it is a very good paper.

I live on a farm three miles from Petersburg, Pa., and I like to live in the country. I have three cows to milk every morning and evening and in the spring, I have to help plow and I generally feed and raise the chickens and turkeys. I think it is very nice for a boy on the farm to help his parents to do their work.

I am going to school now and I am in the eighth grade and am 13 years old. We sell our milk to a large milk dealer in Philadelphia.

I hope to see many other letters

from boys in the Pennsylvania Farmer next week.—Ivan H. Laird, Huntingdon Co., Pa.

Dear Editor—I am very glad we take your paper because I can read the boys' letters and I think every boy should take interest in it.

Our subscription ran out last February, but I got to work at my grandfather with whom I live and, asked him to take it, especially that I might read the boys' letters. He renewed and told me that he also liked to read them. Boys, what do you think they did for me?—they sent me a grand school-box—the best you could get anywhere.

I live on a farm at Willingboro, called the "Old Mill Creek Farm." I have lots of fun, altho I have no brothers and sisters to play with, so I play with my pets which are white cats, a nice dog, some bantams and white rats.

I am twelve years of age and will be 13 July 27, 1921. I was born in the year of 1908. I am in the sixth grade at Willingboro Public School. —Wm. G. Hunter, Burlington Co., New Jersey.

Dear Editor—We get the Pennsylvania Farmer and I am glad to see you have a page for the boys.

We have six hogs, and two of them, a black and a white one, are mine to raise. We also have two dogs, three cats, four horses, and one automobile. Our farm consists of forty acres of land.

I go to school and it is not far from my home. I am going to build some bird houses soon.—H. R. Himes, Lancaster Co., Pa.

Dear Editor—I like to read the Boys' Page in the Pennsylvania Farmer. We live on a large farm in Mifflin Co., Pa. I have four brothers and one sister. Four of the boys go to school and our teacher's name is Mrs. Hartzer. I am eleven years old and in the sixth grade and study eight books.

I belong to a Boys' and Girls' Club and have a helper which is two and one-half years old. She is a Milking Shorthorn and took second prize at the Lewistown Fair last Fall. She has a roan bull calf, two weeks old. My father is a breeder of Milking Shorthorns and Duroc-Jersey hogs.—Irwin Russel Yoder, Mifflin Co., Pa.

Dear Editor—I have been reading the Pennsylvania Farmer and saw that you have a Boys' Page. I am glad that you are having one.

I am in the sixth grade and am ten years old. I live on a farm about two and a half miles from our school. We go to school in a wagon.

I have a pig and am also raising a calf on oatmeal—I have raised two others, one on oatmeal and milk, and the other on a calf meal. We have twelve cows on our farm. I have lived on a farm for about two years and like it very much.

I read the articles about bird houses and I would like to know what kind those who have had experience with them, would advise for the robin. We have a lot of them here. There are also some greenish-black birds here that are not quite as large as robins.—Edward Ambruster, Salem Co., N. J.

Of Interest to Farm Women and Girls

Malnutrition—Its Meaning and Causes
By PEARL MacDONALD, Penna. State College

MALNUTRITION means poorly nourish or undernourished. It signifies a low physical condition, a below-par state of health.

When a child is well physically and has the right kind of food to meet its body needs, it has rosy cheeks, clear complexion and bright eyes. It is happy and full of life and energy, plays hard, enjoys its food and sleeps well. Its muscles are good and its body sturdy.

The undernourished child shows it in many ways. Its eyes are usually dull, and it does not have rosy cheeks. It is generally underweight, and because it does not have sufficient weight to support its height its shoulders generally droop and its shoulder blades often protrude. It may appear to be fat, but the flesh is not firm. It tires easily, and does not sleep well. It is likely to be nervous and irritable, and notional about what it eats.

There are all degrees of malnutrition, from that in which the children are only just a little bit under par

Importance of Sleep

In childhood the body is built up. And at the same time that the body is growing the various tissues are being used up by play and work; even studying uses up a considerable

Convenient Ladders are a Great Help to the Paperhanger

to those where they show it in a very marked degree.

Causes of Malnutrition

There are a number. Following are the most important ones:

Food Lacks.—If food containing materials for making bones, muscles, nerve and other tissues of the body is not supplied in sufficient amount and form for the growing child, obviously the child will be undernourished with all the attending ill results. You cannot operate a machine without fuel and lubricating oil. The human body is a machine, and a very intricate one. Neither can you operate a machine with any of the parts broken or worn out. Just so you cannot keep the human machine in good running order without the right kind and amount of food, and right care of the body.

Elimination of Body Waste

Not all the food eaten is consumed in the body. For example, the

amount of cell tissue. During sleep all the work of the body is slowed up. The heart does not beat so fast, the breathing is slower, etc. Therefore during sleep the body has a chance to repair worn out cell tissue, and in the case of children to make the new tissue demanded for growing. For these reasons children should have long hours of sleep. They should go to bed regularly each night, and have a regular hour for getting up in the morning. If this is adhered to, children go to sleep more readily, and sleep much better.

Getting Over Tired

If children are underweight they tire easily. Frequently they are nervous and irritable. Such children need additional time for relaxation and rest; they should have a rest period of 20 to 30 minutes each morning and afternoon. These rest periods bring better results if taken just before meals, because if their bodies are rested they can digest and

Kill Rats

By Science—New Way

USE Reefer's Rat Virus—new discovery of French scientist. Used all over the world on ships, wharves, warehouses, etc. wherever rats are thick.

Not a Poison

Sure death to every rat and mouse but absolutely harmless to children, dogs, cats, poultry, etc. Use freely without fear. It's a bacteriological concentrate—not a poison. Will kill only rats and mice. *Makes them die outside.* No rotting odors. Only perfect rat killer. Approved by highest scientific authorities.

Guaranteed to Kill Every Rat or Money Refunded

Use Reefer's Rat Virus and every rat and mouse on your premises will be gone, or your money refunded. Don't tolerate rats any longer. Send us \$1.00 and we will send you enough Virus to clear your barn or house of rats. Results guaranteed. Send your order today. Get rid of rats here's your chance, act. **E. J. Reefer** 4814 Main St. Vestnor, N. J.

make better use of the food consumed.

Need Plenty of Fresh Air

Digestion consists of converting food into a form that can be absorbed by the blood stream and carried by it to all parts of the body, where the different tissues—muscles, bone, nerve and other tissues—take what they need and use it.

The process of the body in using food is really a burning process. There is no flame as when wood is burned, but heat is produced, which keeps the body warm. To thus burn food oxygen is needed. The fire in the stove will go out if there is not enough air to keep it alive.

Just so the body cannot use food unless there is a good supply of oxygen. And oxygen is taken into the body and the blood thru the lungs. Then it is carried by the blood all over the body.

The body cannot have as much oxygen as it needs unless we have plenty of fresh air in our homes and schoolrooms and places where we work. It is especially important that at night, when our bodies are repairing the worn out tissue, particularly in the case of children, that there be plenty of fresh air. This can be supplied only by having the windows open.

DOING THE SPRING PAPERING

The coming of spring brings up the question of papering. Everyone likes to have fresh paper for summer, free from the grime which is sure to darken the walls during the winter where there are many stoves in the house. Where stoves must be used it is hard to keep them from giving off dirt and smoke, and when the walls cannot be successfully cleaned, frequent papering seems to be the only way to keep the rooms bright.

In selecting the paper for each room the housewife should keep several things in mind. She should distinguish between the warm and the cold colors and should be guided by the shape and height of the room. No dark room should be made gloomy with greys or deep blues, and bright colors frequently seem out of place on the walls of very sunny rooms. The finish of the furniture and the color of the rugs or carpets should be taken into consideration in choosing the paper.

It takes time and patience for the inexperienced to do a good job of papering but the satisfaction to be derived from a neatly papered room is more than enough to pay for the extra trouble of doing the work right.

One needs a stout plank to walk on when papering the ceiling, two trustworthy stepladders to support the plank; a long wide pasting board, a rule and sharp knife for trimming the paper, a pasting brush, a wide brush like the one illustrated for smoothing the paper onto the wall, clean soft cloths for tamping down the edges, good flour paste, and good patience and strength for the work.

If it is desired to paper a room which has never been papered before and which has been whitewashed it will be necessary to neutralize the whitewash by washing it with a vinegar solution; the acid of the vinegar counteracting the alkali of the whitewash, and the washing removing the particles of loose whitewash. Then the walls should be sized with a thin glue solution or with paste containing some glue.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3548.—A Stylish Costume.—The skirt is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. The waist in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The width of the skirt at the foot is about 1 1/2 yard. Figured net and crepe de chine are here combined. One could have satin and printed foulard, linen and embroidery or pongee and taffeta in combination. To make the dress of one material will require 6 1/2 yards of 27-inch material for medium size. This illustration calls for two separate patterns at 10 cents each.

3538.—3543.—A Smart Gown.—The waist is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. The skirt in 7 sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. To make this dress for a medium size will require 7 1/2 yards of 36-inch material. Crepe de chine or serge with flares or chenille embroidery or linen embroidered would be good for this model. The width of the skirt at the foot with plaits extended is 2 1/2 yards. This illustration calls for two separate patterns which will be mailed to any address on receipts of 10 cents each.

3499.—Pleasing Up-to-date Model.—The pattern is cut in 3 sizes: 16, 18 and 20 years. An 18-year size will require 3 1/2 yards of 44-inch material. Satin, tulle, serge, poplin, and all wash fabrics are attractive for this design. As illustrated embroidered and plain batiste are combined. The width of the skirt at the foot is about 1 1/2 yard. Pattern, 10 cents.

3527.—A Popular Style.—The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size requires 6 1/2 yards of 44-inch material. This is good for combinations of material and for foulard, linen, crepe, satin and taffeta. The gimples could be of crepe or crepe de chine and the dress of serge or satin. The width of the skirt with plaits extended is about 2 1/2 yards. Pattern, 10 cents.

Beechwood RANGES

THE housewife who owns a Beechwood range puts confidence in it. She knows that it will give the good results expected of it.

She knows too, that it has added much to the beauty of her kitchen. This beautiful enameled range will not chip, craze, or crack. Heat will not discolor it. And it cleans easily. All that is needed is a damp cloth. An oiled cloth cleans the polished top.

You have a choice of three colors—blue, brown and gray.

Write for folder. It will interest you.

The Voice of the Pack

by Edison Marshall

CHAPTER XVI

"OVERTAKING Cranston?" "Of course. And it sounds like a crazy dream. But listen, both of you. If we have got to die, up here in the snow—and it looks like we had—what is the thing you want done worst before we go?" Lennox's hands clasped, and he leaned forward on the sled. "Pay Cranston!" he said.

"Yes!" Dan's voice rang. "Cranston's never going to be paid unless we do it. There will be no signs of incendiarism at the house, and no proofs. They'll find our bodies in the snow, and we'll just be a mystery, with no one made to pay. The evidence in my pocket will be taken by Cranston, sometime this winter. If I don't make him pay, he never will pay. And that's one reason why I'm going to try to carry out this plan I've got."

"The second reason is that it's the one hope we have left. I take it that none of us are deceived on that point. And no man can die tamely—if he is a man—while there's a chance. I mean a young man, like me—not one who is old and tired. It sounds perfectly silly to talk about finding Cranston's winter quarters, and then, with my bare hands, conquering him, taking his foods and his blankets and his snowshoes and his rifle to fight away these wolves, and bringing 'em back here."

"You wouldn't be barehanded," the girl reminded him. "You could have the pistol."

He didn't even seem to hear her. "I've been thinking about it. It's a long, long chance—much worse than the chance we had of getting out by straight walking. I think we could have made it, if the wolves had kept off and the snowshoe hadn't broken. It would have nearly killed us, but I believe we could have got out. That's why I didn't try this other way first. A man with his bare hands hasn't much of a chance against another with a rifle, and I don't want you to be too hopeful. And of course, the hardest problem is finding his camp."

"But I do feel sure of one thing: that he is back to his old trapping line on the North Fork—somewhere south of here—and his camp is somewhere on the river. I think he would have gone there so that he could cut off any attempt I might make to get thru with those letters. My plan is to start back at an angle that will carry me between the North Fork and our old house. Somewhere in there I'll find his tracks, the tracks he made when he first came over to burn up the house. I suppose he was careful to mix 'em up after once he arrived there, but the first part of the way he likely walked straight toward the house from his camp. Somewhere, if I go that way, I'll cross his trail—within ten miles at least. Then I'll back-trail

him to his camp." "And never come back!" the girl cried.

"Maybe not. But at least everything that can be done will be done. Nothing will be left. No regrets. We will have made the last trial. I'm not going to waste any time, Snowbird. The sooner we get your fire built the better."

"Father and I are to stay here—?" "What else can you do?" He went back to his traces and drew the sled one hundred yards further. He didn't seem to see the gaunt wolf that backed off into the shadows as he approached. He refused to notice that the pack seemed to be growing bolder. Human hunters usually had guns that could blast and destroy from a distance; but even an animal intelligence could perceive that these three seemed to be without this means of inflicting death. A wolf is ever so much more intelligent than a crow—yet a crow shows little fear of unarmed man and is wholly unapproachable by a boy with a gun. The ugly truth was simply that in their increasing madness and excitement and hunger, they were becoming less and less fearful of these three strange humans with the sled.

It was not a good place for a camp. They worked a long time before they cleared a little patch of ground of its snow mantle. Dan cut a number of saplings—laboriously with his ax—and built a fire with the comparatively dry core of a dead tree. True, it was feeble and flickering, but as good as could be hoped for, considering the difficulties under which he worked. The dead logs under the snow were soaked with water from the rains and the thaws. The green wood that he cut smoked without blazing.

"No more time to be lost," Dan told Snowbird. "It lies in your hands to keep the fire burning. And don't leave the circle of the firelight without that pistol in your hand."

"You don't mean," she asked unbelieving, "that you are going to go out there to fight Cranston—unarmed?"

"Of course, Snowbird. You must keep the pistol."

"But it means death; that's all it means. What chance would you have against a man with a rifle? And as soon as you get away from this fire, the wolves will tear you to pieces."

"And what would you and your father do, if I took it? You can't get him into a tree. You can't build a big enough fire to frighten them. Please don't even talk about this matter, Snowbird. My mind's made up. I think the pack will stay here. They usually—God knows how—know who is helpless and who isn't. Maybe with the gun, you will be able to save your lives."

"What's the chance of that?"

"You might—with one cartridge—kill one of the devils; and the others—but you know how they devour their own dead. That might break their famine enough so that they'd

hold off until I can get back. That's the prize I'm playing for."

"And what if you don't get back?" He took her hand in one of his, and with the other he caressed, for a single moment, the lovely flesh of her throat. The love he had for her spoke from his eyes—such speech as no human vision could possibly mistake. Both of them were tingling and breathless with a great, sweet wonder.

"Never let those fangs tear that softness, while you live," he told her gently. "Never let that brave old man on the sled go to his death with the pack tearing at him. Cheat 'em, Snowbird! Beat 'em the last minute, if no other way remains! Show 'em who's boss, after all—of all this forest."

"You mean—?" Her eyes widened.

"I mean that you must only spend one of those three shells in fighting off the wolves. Save that till the moment you need it most. The other two must be saved—for something else."

She nodded, shuddering an instant at a menacing shadow that moved within sixty feet of the fire. The firelight half-blinded them, dim as it was, and they couldn't see into the darkness as well as they had before. Except for strange, blue-yellow lights, close together and two and two about the fire, they might have thought that the pack was gone.

"Then good-by, Dan!" she told him. And she stretched up her arms. "The thing I said—that day on the hillside—doesn't hold any more."

His own arms encircled her, but he made no effort to claim her lips. Lennox watched them quietly; in this moment of crisis not even pretending to look away. Dan shook his head to her entreating eyes. "It isn't just a kiss, darling," he told her soberly. "It goes deeper than that. It's a symbol. It was your word, too, and mine; and words can't be broken, things being as they are. Can't I make your understand?"

She nodded. His eyes burned. Perhaps she didn't understand, as far as actual functioning of the brain was concerned. But she reached up to him, as women—knowing life in the concrete rather than the abstract—have always reached up to men; and she dimly caught the gleam of some eternal principle and right behind his words. This strong man of the mountains had given his word, had been witness to her own promise to him and to herself, and a law that goes down to the roots of life prevented him from claiming the kiss.

Many times, since the world was new, comfort—happiness—life itself have been contingent on the breaking of a law. Yet in spite of what seemed common sense, even though no punishment would forthcome if it were broken, the law has been kept. It was this way now. It wouldn't have been just a kiss such as boys and girls have always had in the moonlight. It meant the symbolic renunciation of the debt that Dan owed Cranston—a debt that in his mind might possibly go unpaid, but which no weight of circumstance could make him renounce.

His longing for her lips pulled at the roots of him. But by the laws of his being he couldn't claim them until the debt incurred on the hillside, months ago, had been paid; to take them now meant to dull the fine edge of his resolve to carry the tissue thru to the end, to dim the star that led him, to weaken him, by bending now, for the test to come. He didn't

know why. It had its font in the deep wells of the spirit. Common sense can't reveal how the holy man keeps strong the spirit by denying the flesh. It goes too deep for that, Dan kept to his consecration.

He did, however, kiss her hands, and he kissed the tears out of her eyes. Then he turned into the darkness and broke thru the ring of the wolves.

CHAPTER XVII

Dan Failing was never more thankful for his unerring sense of direction. He struck off at a forty-five-degree angle between their late course and a direct road to the river, and he kept it as if by a surveyor's line. All the old devices of the wilderness—the ridge on ridge that looked just alike, inclines that to the casual eye looked like downward slopes, streams that vanished beneath the snow, and the snow-mist blowing across the face of the landmarks—could not avail against him.

A half dozen of the wolves followed him at first. But perhaps their fierce eyes marked his long stride and his powerful body, and decided that their better chance was with the helpless man and the girl beside the flickering fire. They turned back, one by one. Dan kept straight on and in two hours crossed Cranston's trail.

It was perfectly plain in the moonlit snow. He began to back-track. He headed down a long slope and in an hour more struck the North Fork. He didn't doubt but that he would find Cranston in his camp, if he found the camp at all. The man had certainly returned to it immediately after setting fire to the buildings, if for no other reason than for food; and Cranston would certainly know this fact.

Dan didn't know when a rifle bullet from some camp in the thickets would put an abrupt end to his advance. The brush grew high by the river, the elevation was considerably lower, and there might be one hundred camps out of the sight of the casual wayfarer. If Cranston should see him, musing among the moonlit snow, it would give him the most savage joy to open fire upon him with his rifle.

Dan's advance became more cautious. He was in a notable trapping region, and he might encounter Cranston's camp at any moment. His keen eyes searched the thickets, and particularly they watched the sky line for a faint glare that might mean a camp fire. He tried to walk silently. It wasn't an easy thing to do with awkward snowshoes; but the river drowned the little noise that he made. He tried to take advantage of the shelter of the thickets and the trees. Then, at the base of a little ridge, he came to a sudden halt.

He had estimated just right. Not two hundred yards distant, a camp fire flickered and glowed in the shelter of a great log. He saw it, by the most astounding good fortune, thru a little rift in the trees. Ten feet on either side, and it was obscured.

He lost no time. He did not know when the wolves about Snowbird's camp would lose the last of their cowardice. Yet he knew he must keep a tight grip on his self-control and not let the necessity of haste cost him his victory. He crept forward, step by step, placing his snowshoes with consummate care. When he was one hundred yards distant he

saw that Cranston's camp was situated beside a little stream that flowed into the river and that—like the mountaineer he was—he had built a large lean-to reinforced with snowbanks. The fire burned at its opening. Cranston was not in sight; either he was absent from camp or asleep in his lean-to. The latter seemed the more likely.

Dan made a wide detour, coming in about thirty yards behind the construction. Still he moved with incredible caution. Never in his life had he possessed a greater mastery over his own nerves. His heart leaped somewhat fast in his breast; but this was the only wasted motion. It isn't easy to advance thru such thickets without ever a misstep, without the rustle of a branch or the crack of a twig. Certain of the wild creatures find it easy; but men have forgotten how in 100 many centuries of cities and farms. It is hardly a human quality; and a spectator would have found a rather ghastly fascination in watching the lithe motions, the passionless face, the hands that didn't shake at all. But there were no spectators—unless the little band of wolves, stragglers from the pack that had gathered on the hills behind—watched with lighted eyes.

Dan went down at full length upon the snow and softly removed his snowshoes. They would be only an impediment in the close work that was sure to follow. He slid along the snow crust, clear to the mouth of the lean-to.

The moonlight poured thru and showed the interior with rather remarkable plainness. Cranston was sprawled, half-sitting, half-lying on a tree-bough pallet near the rear wall. There was not the slightest doubt of the man's wakefulness. Dan heard him stir, and once—as if at the memory of his deed of the day before—he cursed in a savage whisper. Altho he was facing the opening of the lean-to, he was wholly unaware of Dan's presence. The latter had thrust his head at the side of the opening, and it was in shadow. Cranston seemed to be watching the great, white snow fields that lay in front, and for a moment Dan was at loss to explain this seeming vigil. Then he understood. The white field before him was part of the long ridge that the three of them would pass on their way to the valleys. Cranston had evidently anticipated that the girl and the man would attempt to march out—even if he hadn't guessed they would try to take the helpless Lennox with them—and he wished to be prepared for emergencies. There might be sport to have with Dan, unarmed as he was. And his eyes were full of strange conjectures in regard to Snowbird. Both would be exhausted now and helpless—

Dan's eyes encompassed the room; the piles of provisions heaped against the wall, the snowshoes beside the pallet, but most of all he wished to locate Cranston's rifle. He couldn't find it at first. Then he saw the glitter of its barrel in the moonlight—leaning against a grub-box possibly six feet from Cranston and ten from himself.

His heart leaped. The best he had hoped for—for the sake of Snowbird, not himself—was that he would be nearer to the gun than Cranston and would be able to seize it first. But conditions could be greatly worse than they were. If Cranston had actually had the weapon in his hands, the odds of battle would have been frightfully against Dan. It takes a certain length of time to seize, swing

and aim a rifle; and Dan felt that while he would be unable to reach it himself, Cranston could not procure it either, without giving Dan an opportunity to leap upon him. In all his dreams thru the months of preparation, he had pictured it thus. It was the test at last.

The gun might be loaded, and still—in these days of safety devices—unready to fire; and the loss of a fraction of a second might enable Cranston to reach his knife. Thus Dan felt justified in ignoring the gun altogether and trusting—as he had most desired—to a battle of hands. And he wanted both hands free when he made his attack.

If Dan had been erect upon his feet, his course would have been an immediate leap on the shoulders of his adversary, running the risk of Cranston reaching his hunting knife in time. But the second that he would require to get to his feet would entirely offset this advantage. Cranston could spring up too. So he did the next most disarming thing. He sprang up and strode into the lean-to.

"Good evening, Cranston," he said pleasantly.

Cranston was also upon his feet the same instant. His instincts were entirely true. He knew if he leaped for his rifle, Dan would be upon his back in an instant, and he would have no chance to use it. His training, also, had been that of the hills, and his reflexes flung him erect upon his feet at the same instant that he saw the leap of his enemy's shadow. They brought up face to face. The rifle was now out of the running, as they were at about equal distances from it, and neither would have time to swing or aim it.

Dan's sudden appearance had been so utterly unlooked-for, that for a moment Cranston could find no answer. His eyes moved to the rifle, then to his belt where hung his hunting knife, that still lay on the pallet. "Good evening, Failing," he replied, trying his hardest to fall into that strange spirit of nonchalance with which brave men have so often met their adversaries, and which Dan had now. "I'm surprised to see you here. What do you want?"

Dan's voice when he replied was no more warm than the snow banks that reinforced the lean-to. "I want your rifle—also your snowshoes and your supplies of food. And I think I'll take your blankets, too."

"And I suppose you mean to fight for them?" Cranston asked. His lips drew up in a smile, but there was no smile in the tone of his words.

"You're right," Dan told him, and he stepped nearer. "Not only for that, Cranston. We're face to face at last—hands to hands. I've got a knife in my pocket, but I'm not even going to bring it out. It's hands to hands—you and I—until everything's square between us."

"Perhaps you've forgotten that day on the ridge?" Cranston asked. "You haven't any woman to save you this time."

"I remember the day, and that's part of the debt. The thing you did yesterday is part of it too. It's all to be settled at last, Cranston, and I don't believe I could spare you if you went to your knees before me. You've got a clearing out by the fire—big as a prize ring. We'll go out there—side by side. And hands to hands we'll settle all these debts we have between us—with no rules of fighting and no mercy in the end!" (Concluded Next Week).

SEE YOUR INTERNATIONAL DEALER FOR PARTICULARS AS TO LOWERED PRICES

SEVERAL factors help to explain why *International Engines* are popular wherever they are used. But the most prominent reason is that they do the work their owners want done when it should be done.

International Engine owners know that if there is feed to grind, the International will do it. If there is water to pump, the International will pump it. The same is true with wood sawing, churning, chopping feed, fanning grain, etc., etc. The International will turn the trick, when you give it a chance.

In accomplishing this, *International Engines* use low-grade fuels. They are simple to operate—many farmer boys not yet in their teens start and operate International Engines with ease.

International Engines have built-in magneto, replaceable cylinder liners, enclosed crank cases. They are hopper-cooled, and have many other valuable features. Made in 1½, 3, 6, and 10 h. p. sizes.

Send a postal for an engine pamphlet.

CARNegie, PA.

Get Swift's Red Steer Fertilizer now

A Swift dealer is near you with fertilizer in his warehouse—or ready to wire us your order. We are ready to make prompt shipment of well cured goods.

It is a short haul from one or more of our twenty-four fertilizer factories to your railroad station.

If you haven't invested in Swift's Red Steer Fertilizer or want more to make the application per acre heavier or spread on new fields, you can order now and get it.

The farmer that makes a heavy application of fertilizer is the one that gets the low costs, the big yields and makes the most profit.

Fertilize every acre. Remember that one acre fertilized is generally good for more profit than two acres without fertilizer.

Don't wait—get your Swift's Red Steer Fertilizer now!

Buy from our local dealer or our nearest Sales Division.

Swift & Company, Dept. 14
(Fertilizer Works)

Baltimore, Md. Cleveland, Ohio

Grow your crops at less cost

Many farmers are making more profit from fifty acres properly fertilized than others are making from twice as many acres without fertilizer.

It costs no more for preparation of land, seed and seeding, ground rental or interest on an acre of land yielding 80 bushels of best corn or a big truck crop of good quality than for one yielding half as much of poor quality.

One sure way of growing crops at less cost is to secure more yield per acre and per man. This you can do by using Swift's Red Steer Fertilizers.

The extra bushels or pounds produced per acre by Swift's Red Steer Fertilizers are the ones that add greatly to your profit. Only the cost of fertilizer can be charged against this extra yield.

Seed Potatoes— Good and Bad

A Comparison Showing the Value of Planting Good Seed

By F. E. GAYLORD

ONE HUNDRED-FIFTEEN bushels per acre from certified seed potatoes as compared with 53 bushels from potatoes sold for "seed" was the verdict rendered at digging time in the court of experience last year on Blaine Miller's Farm near LaFayette, Indiana.

Miller tried both kinds of seed, having bought 50 bushels of real potato seed—potatoes which had been grown and selected especially for seed potatoes and he likewise bought, at a nearby town, about 50 bushels of potatoes sold for seed. Both lots of potatoes were planted in the same field; both were given the same careful attention and harvested at the same date. The good seed came up and produced a fine stand of vigorous healthy plants while the store potatoes came up unevenly and could be easily picked out thruout the summer. At digging time the potatoes from selected seed produced 115 bushels of clean, smooth, marketable potatoes while the other ran only 53 bushels per acre and part of these had to be discarded as they were too small to sell.

Nor is this the only case tried last year. Another noticeable one was on the farm of F. A. Bond in Porter County. Bond, and Pierce, his neighbor, decided to put out 10 acres of potatoes. While they had enough of their own seed to plant the field, they decided to buy some selected seed and try it out just to see which gave the best results. Mr. Pierce was a little skeptical about trying out other seed than his own but Bond went ahead and purchased it. Their own potatoes had been "green sprouted" so they came up before the other potatoes which arrived too late to give them time to "green" any. It wasn't long until the potatoes from selected seed showed their superiority. With twelve weeks of hot dry weather the potato plants had a very hard time. At cutting it had been noticed that their own seed potatoes contained several which indicated wilt but these were planted just the same. As the dry weather came on the plants in this side of the field began to yellow, wilt and die and be-

Poor Seed Means a Diseased Crop and an
Uneven Stand

100 bushels to the acre without a cull, and sold for \$2 per bushel while the others ran 60 bushels, 10 of which had to be discarded because they were too small and had so much wilt infection in them as to make them unfit even for eating purposes. Many farmers near Bond's place early in the season were skeptical about their being any great difference in "seed potatoes" and allowed that

he had better plant his own. During the summer the county agent, Mr. Sink, and Bond invited them in to see the field. None went away who were not convinced of the success of using "good seed stock." While farmers generally had a potato failure, Bond and Pierce wore a broad smile as they sold the potatoes at digging time for \$2 a bushel and couldn't supply the demand.

The usual run of potato seed brought into town is not seed potatoes but potatoes sold for seed. Its past is shaded in the clouds of obscurity. Ask the dealer where it came from or under what conditions it grew, whether or not it has been taken from especially selected seed fields and if it is true to variety. If he cannot give you a clean bill of health for the potatoes you had better get some seed that has passed the board of censorship.

Potatoes which have been carefully grown for seed with attention being paid to freedom from disease, trueness to type and high producing qualities are always marked as such, while ordinary stock sold as potato seed is bought with no more knowledge of its past or assurance of its future than that it is "potato seed."

Many farmers and potato growers are planting seed from selected stocks and saving their own seed from this. Others are picking at digging time the best hills for seed another year.

While the tops are still green yet as late in the fall as possible is the time to select seed for another year. At this time go thru the field selecting the hills of one or two stalks which are vigorous and healthy. Dig these by hand and save the hills which produce a large number of smooth, uniform, marketable tubers. Do not select any hills for seed in which the vines are small or weak, or which at digging time are found to have borne either a few large potatoes or a large number of small, ill-shaped ones. By following this method of selecting the seed stock farmers can easily build up a strain of potatoes superior to those that can be bought at the store.

Building Up a Retail Trade

If the farmer produces a product of good quality and markets it in a business-like way he has much less to fear in time of vacillating markets, than the one who depends on the stock buyer and the middleman.

The recent slump in prices found us with a number of hogs on hand. The loss would have been great, as prices offered were about 8 cents a pound when we were ready to dispose of the animals. At this figure they would have brought about \$20 each. The hogs were butchered on the farm, made into high-class sausage; cuts such as tenderloin, back bones and spare ribs were sold separately. Only the choicest meat was used, and after paying expenses of selling, the hogs brought about \$35 each. There was some lard left, and a small amount of side pork from which the lean had been cut and used with the sausage. Orders were taken at hotels, high-class restaurants, and from the homes of the well-to-do people of a nearby city. The meat was delivered soon after butchering, and could be guaranteed fresh. After the first trip, repeat orders came easily, and satisfied customers told their friends, and in this way the demand for the products was even better than anticipated.

Had we charged structural iron worker's wages, there would have been no cash left to be

credited to the pork production end of the business, but as it worked out the marketing was the most profitable end of the game.

The second time over the city we found there was a demand for special parts of the carcass. One lady was particularly anxious to secure the heart, lungs and liver. The tenderloin, which cannot usually be secured as such from the butcher-brought a particularly good figure. We took precaution to have all meat neatly packed, the sausage in cloth sacks, and the other cuts in nice clean paper neatly tied. This paid, and did as much as the assurance of good quality meat.

It will pay the farmer when dealing directly with city trade to supply only the best he can give. He should have his packages neat, his goods should be clean, and if they do not suit, refund without question. The city people may be critical in their wants, but they are willing to pay for what they get.

The farmer cannot wrap his product in a newspaper, and hand it out to the customer expecting to command the respect and future business of that individual. He must show that he is a business man worthy of consideration, otherwise, there will even be more numerous steps in process of marketing, which will be thrust in between the farmer and the consumer. Grading,

packing, and advertising must be done by some one. If the farmer does not do it he pays for it, and pays heavily.

The farmer dealing with city customers cannot afford to be grouchy or tactless. We have dealt with a high-class trade in poultry for more than a dozen years. It has paid to hold our tongues when "turn downs" come.

We had one customer who asked for shipment of a dressed turkey once in two weeks during the winter months. The second turkey shipped was returned at our expense. However, later, we learned the turkey came at a time when family had been called away, and maids not having had instructions, returned the fowl.

If the farmer is liberal in his weights, not exacting about the last penny in change, and is thoughtful in the way of a bunch of flowers or some little token from the country, the well-to-do city customer is the most desirable person with whom he can do business. When the city customer has confidence in the farmer and his product, then the farmer can explain to a willing hearer just what his problems are. In this way the farmer and the city man can get together to the advantage of both, whereas now the city and country are pulling apart more and more each year.—W. J.

The Value of Crop Rotations

By Dr. J. G. LIPMAN
Director New Jersey Experiment Station

DWELLERS in newly developed agricultural regions often specialize in the growing of a single crop. This is true, for instance, of cotton, tobacco, potatoes, corn, wheat, flax, etc. The same crop is grown year after year on the same land until it ceases to be profitable. Sooner or later the farmers realize that, by establishing a crop rotation, better results and profits may be had. The reasons why rotations of crops are, in the long run, more satisfactory than single cropping are mainly the following:

1—Crop rotations permit of the more efficient use of farm labor. The different crops of the rotation do not mature at the same time. Hence, farm labor can be better distributed. The marketing of the crops is also somewhat simplified and the risks due to fluctuating prices not so great.

2—Because of differences in the amount and distribution of rainfall and the range of spring and summer temperatures, a succession of crops is more likely to protect the farmer against untoward climatic conditions than would any system of single cropping. For instance, in a rotation including wheat and corn there might be favorable temperature and rainfall for a good yield of wheat, but not for a good yield of corn. In other seasons the reverse may be true.

3—Where the same crop is grown continuously or frequently on the same land, plant diseases and insects peculiar to the particular crop become more and more troublesome. In some cases it is necessary to have very long rotations in order to escape the ravages of certain plant diseases. Potato scab, clover sickness, flax wilt, and similar diseases, are examples of this sort.

4—Crop rotations are of advantage as compared with single cropping because they permit of better provision for the maintenance of soil fertility.

From the standpoint of soil fertility the subject of crop rotations is an important one. It is widely recognized that cultivated land loses large quantities of organic matter or humus. Where clean cultivation is practiced year after year, it is next to impossible to maintain a sufficient supply of humus in the soil even though large quantities of barnyard manure may be used. On the other hand, where land is seeded down to grass and kept in sod for two or more years the accumulation of humus-making materials in the soil far exceeds the loss. Hence, the keeping of land in sod for any considerable length of time allows the restoration of the humus that was lost on account of the growing of cultivated crops. Land of fair fertility will contain 0.1 to 0.15 per cent of nitrogen. This would correspond, roughly, to 2 to 3 per cent of fresh and partly decayed vegetable matter. Assuming that an acre of land to a depth of 6½ inches will weigh about 2 million pounds, a fair soil should contain 20 to 30 tons of organic matter per acre to the depth just mentioned. Where clean cultivation is practiced humus may be lost at the rate of one ton per acre or more during each growing season.

Crop rotations are as important from the standpoint of maintaining the supply of soil nitrogen as they are for maintaining a suitable supply of organic matter. Where crop yields are up to the average, or a little better than the average, the annual loss of nitrogen from the land may amount to 50 to 100 pounds per acre. This loss must be made good either by the use of manure or commercial fertilizer or by the use of such crops in the rotation as will gather nitrogen from the air and increase thereby the nitrogen content of the soil. Crops like clover, alfalfa, sweet clover, cow-peas, soybeans, etc., when regularly included in the rotation, help to offset the loss of soil nitrogen due to the removal of this constituent by the crop or, thru the formation of soluble nitrates in the soil, that are subject to washing out by the fall and winter rains. A good crop of clover may be able to accumulate from the air in one growing season 75 to 150 pounds of nitrogen. Even when the clover is har-

vested and made into hay a large part of the nitrogen remains in the soil in the form of roots and stubble. Where the rotations are long and the number of legume crops in the rotations limited, the restoring of the nitrogen to the soil may not keep pace with the loss of it. In the common five-year rotation consisting of corn, oats, wheat, timothy and clover the nitrogen is not replenished sufficiently fast to permit the satisfactory maintenance of a sufficient supply of nitrogen in the soil. The situation becomes even worse when the clover begins to fall—some times on account of lack of lime in the soil; at other times on account of various fungous diseases to which clover is subject. For this reason, efforts are made to modify the rotation by growing soybeans instead of oats, and by using alsike instead of red clover. Occasionally, growers attempt to improve on this rotation still further by sowing a leguminous crop in the corn. In the southern states, for instance, it is not uncommon to plant cowpeas or soybeans in the corn, and to plow under the resulting crop in the following spring. Farther north winter vetch and crimson clover, alsike and alfalfa are also used for this purpose. Where the rotations are short the replenishing of the supply of soil nitrogen becomes easier. For instance, in rotations consisting of corn, oats and clover it is fairly easy to maintain a good supply of nitrogen in the land as long as the clover can be made to grow without difficulty. Rotations consisting of corn, oats and alfalfa for two or three years also permit the maintaining

toxins has been greatly exaggerated, it is nevertheless true that, in the case of some crops at least, residues are left in the soil which are more or less inimical to the best development of succeeding crops of the same species.

In order to obtain the very best returns from crops grown in more or less definite rotations, provision should be made for favoring the legumes so far as possible. Good crops of corn are usually harvested after clover, but, where the clover crop is a poor one, the following corn crop is likely to be unsatisfactory. By using lime we encourage the growth of the clover. The same is also true of phosphoric acid and potash. For instance, we can stimulate the growth of the clover not only for its own sake, but for the sake of the benefit which it may have on the succeeding crops. The larger the yield of clover, the greater the amount of nitrogen left in the roots and stubble. Hence, the greater amount of nitrogen which will later be changed into nitrates to be used by the following crop of corn, oats, wheat, barley, etc.

The returns from crop rotations may be further increased by selecting such strains of corn, wheat, oats, clover, etc., as would be resistant to disease and will, in general, thrive best under the given conditions of soil and climate. It may be added, further, that there seems to be some relation between the type of the crop grown on the land and the numbers and kinds of bacteria active in the soil. Such evidence as is now available would seem to indicate that crop rotations are more suitable than single cropping for establishing an active, vigorous combination of bacteria in the soil. In view of the important part that soil bacteria play in making available plant-food in the soil, the practice of rotating crops is made desirable also for this reason.

DELAWARE FARM BUREAU FEDERATION ORGANIZED

With a membership of 2200 Delaware farmers, the organization of the Delaware State Farm Bureau Federation was completed at the first annual meeting held in the Century Club rooms, in Dover, Tuesday, March 22. By the unanimous selection of the nominating committee, and a standing vote by acclamation of the delegates, W. V. Cosden of Dover, was elected president. In presenting Mr. Cosden's name, Thos. N. Rawlins, of Seaford, chairman of the nominating committee, said that his committee felt it would be the unanimous wish of the members of the Federation to confer this honor upon the man who had so successfully planned the membership campaign and given so unreservedly of his time to bring about its present success and strength.

John Ponder, of Milton, a former president of the Sussex County Farm Bureau, was made vice-president, and Frank F. Yearsley, of Marlinton, president of the New Castle County Farm Bureau, was chosen as treasurer of the State Federation. The office of secretary is appointive and carries with it much of the executive work of the State office. This position is to be filled by the Executive Committee, which will consist of the elected officers and two additional members elected from each county farm bureau.—The Delawarean.

ANOTHER BIG TREE

I have been reading some articles in the Pennsylvania Farmer relating to big trees in Pennsylvania. One gentleman tells of one 22 feet in circumference, 18 inches from the ground, with a seventy-foot spread of branches.

We have some big trees in Jersey also. I have one, a white oak, in my yard, measuring 30 feet in circumference, 18 inches from the ground, and has 105 ft. spread of branches and there are many limbs that will measure two feet in diameter. This tree is on my farm in Salem Co., New Jersey.—Lemuel Denelsbeck.

The Pet of The Farm

A Farmer's Idea

Our Mr. D. B. Smith, born and brought up on a farm, found the old way of killing bugs and insects, with brush and pail, slow, hard work and inefficient. After years of experiment he invented the first Hand and Compressed Air Sprayer ever produced. Being familiar with a farmer's requirements, Mr. Smith recommends to you

SMITH'S NO. 22 BANNER COMPRESSED AIR SPRAYER

for all around farm or garden use. Sprays trees, shrubs, potatoes and field crops for insects and fungus; sprays stables, pig and poultry pens; barn yards for lice and vermin and for disinfecting. Used for whitewashing stables, poultry houses and fences and for washing windows, buggies, autos and for spraying cattle. Built for work. Heavy brass or galvanized steel, well riveted tank—holds 4 gallons. Seamless brass pump—2 inches diameter; brass castings. Automatic Brass Non-clogging Nozzle, throws long distance fine mist or coarse spray. Easily operated by man or boy. Be sure and ask your dealer for it by name, if he can't supply you, write

D. B. SMITH & CO., Manufacturers
90 Genesee St., UTICA, N. Y.
On sale in New York City at No. 98 Chambers St.
We make 50 different styles and sizes of sprayers. If you are interested in smaller or larger sprayers send for catalog.

PURE FARM SEEDS

That conform strictly to seed laws of all states. Clover, Alsike, Timothy, Alfalfa, Soy Beans and all kinds of PURE FARM SEEDS. Twenty-five years selling seeds and satisfaction. Write for free samples.

Helps on Machinery Problems

THE erratic operation of an internal combustion engine such as is used on practically all farm light and power plants, is more often due to dirty and defective spark plugs than to any other cause. Yet a spark plug is a very simple device, merely a heavy wire projecting thru a metal skirt from which it is insulated by porcelain, mica, or some other kind of insulating material with the end of the wire which is inside the engine cylinder placed close to a projection from the metal skirt, leaving a very narrow space across which the spark which is to ignite the fuel charge is expected to jump.

The job which the spark plug is called upon to do does not at first glance look like a very hard one. It is not at all difficult to insulate a heavy piece of wire from a metal skirt or base so that even the "high tension" spark cannot get thru the insulation, and so that in case a high voltage current of electricity is sent thru the wire, it will jump across the small space to the projection on the skirt, and in so doing, ignite the fuel charge.

But there are several things which make it hard for the spark plug to perform satisfactorily at all times. First, and worst, there is often a great deal of soot, or lamp black, formed in the combustion chamber which is deposited on the porcelain or other insulating material on the inside end of the spark plug. This soot is practically pure carbon, and carbon, as everyone knows, it quite a good conductor of electricity. If this coating of soot, therefore, covers the porcelain from the skirt of the plug to the central wire or electrode, the high voltage current of electricity which is supposed to jump the spark gap and ignite the fuel, will naturally take the path of least resistance and pass thru the thin layer of carbon, since electricity does not like to jump gaps in its circuit if it can be avoided and will always complete its trip by the easiest route. Air is a much poorer conductor of electricity than carbon—electricity would rather pass thru an inch or more of a carbon coating than across an air gap of only one-fiftieth of an inch.

It is scarcely necessary to point out the fact that if the electricity can travel from the central wire or electrode to the skirt, by passing thru the carbon coating on the insulator, there will be no spark at the spark gap and there will be a misfire in the cylinder. Sometimes there is not enough carbon for all the electric current to pass thru so the current divides and part of it goes thru the carbon coating while the other jumps the spark gap. This makes a "weak" spark, one which is not so hot as would be the case should the entire current cross the air gap. A weak spark may cause a misfire, or it may ignite the charge but do such a poor job that the fuel burns comparatively slowly, so that the full power of the fuel is not obtained.

From the above it will be seen how important it is to have the inside end of the insulator kept free from carbon, since the presence of carbon on the insulator interferes seriously with the proper operation of the motor.

Master—Can a leopard change his spots? Freddie—Yes, sir. "Now that's wrong. You know a leopard cannot change his spots." "Oh, but he can, sir, really." "Well, tell me how, then." "When he's tired of sitting on one spot he can change to another."

ings were all tightened up. I always kept plenty of heavy oil in the crank case. The plant is located in an outhouse on my farm. It runs fine after it warms up." From your meager description of the ailment I would say the heavy oil was the trouble. The cold, unheated outhouse causes the oil to thicken. When you start the engine it is like pulling the connecting rod and crank shaft thru solid grease. Lighter oil in cold weather or heating your power house would probably overcome this. Try it and if it does not improve write me in detail.

Correct Way to Connect a Motion Picture Machine and a Small Electric Power Plant

power above that actually required is not a bad feature. The variable resistance shown in the sketch must be of sufficient resistance to absorb the entire output of the generator. The motion picture lamps now used are of the high efficiency type which means that for the best work they must have a fixed current with practically no voltage variation. It is therefore wise to have an ammeter in the line as shown on the sketch. There is no switch used between the source of electric current and the lamp, the resistance is used entirely for this purpose.

"When a motor is required to operate a film a resistance equal to that of the motor at full speed must be inserted in the line as shown in the sketch. When the motor switch is thrown into the "on" position this resistance is automatically cut out but when the motor is shut-off, the resistance automatically cuts in keeping the resistance of the total circuit a constant quantity.

"In other words, the circuit is designed to maintain a fixed load at all times on the engine no matter whether the lamp is being turned off or on or whether the motor is used or not. The only care required is at the time of starting the generator at which time the variable resistance must absorb the full output."

Master—Can a leopard change his spots? Freddie—Yes, sir. "Now that's wrong. You know a leopard cannot change his spots." "Oh, but he can, sir, really." "Well, tell me how, then." "When he's tired of sitting on one spot he can change to another."

FERTILIZING THE APPLE ORCHARD

(Continued from Page Six).

the application well out beyond the spread of the branches, or it may be put on with a drill over the entire area. The former method is probably preferable with young trees, while there is little if any difference in the results of the two methods in mature trees.

As to time of application, we have no really definite data as to what is the very best time to make the applications. The common advice at present is to make them some time prior to blooming and probably preferably about as soon as the buds start into growth, if it is desired to get the maximum effect on the crop of the current season. For the crop of the following season, however, and for the maximum effect of the fertilization applied, we have no positive advice to give so far as the most effective time of application is concerned. We do know, however, that we have been able to secure very profound effects on the crop of the following season with initial applications made as late as the eighth of July, and we have even made them as late the first of August with very favorable results.

In view of these facts, we believe that the best practice now available is to make the applications of quickly available nitrogen ahead of the bloom in the year in which a light crop is expected, and after the bloom in the full crop years. Such a course offers opportunity to vary the applications somewhat in proportion to the amount of fruit set on the trees in the full crop years, and it should also exert the maximum effect in evening up the crops of the off years.

CONTROLLING ROOT MAGGOT

How an initial outlay of but forty dollars can make a net gain of from \$600 to \$900 per acre in the production of early cabbage is revealed in the results of experiments with root maggot control on that crop by the tar disk method, conducted last season in Dauphin and Washington Counties. H. E. Hodgkiss, extension plant insect specialist at the Pennsylvania State College, co-operating with cabbage growers and the farm agents in these counties, has but recently announced the startling results in increased yield.

The experiment was conducted on two Dauphin and one Washington County farm. Small, round pieces of ordinary tar paper were fitted about the stalks of early cabbage plants at a cost of from \$40.80 to \$42.60 per acre. On one Dauphin plant the acre yield of untreated cabbage was 2486 mature heads, against 10,057 for those treated with tar disks. This was an increase of 7571 heads or a net gain of \$716.30 at market prices. On the other Dauphin plot the untreated yield was only 624 mature heads, and that with the protection afforded 10,343 heads, with a net gain of \$931. The Washington county experiment gave 2496 mature heads untreated, and 9604 heads for the treated, or a net gain of \$668.20 per acre.

These figures, according to the college specialist, show conclusively that it pays to go to the extra expense of placing protecting tar disks on early cabbage to prevent destruction by the root maggot.

If you have a grouch, hold it 'till after the next meal. Feeding cures it.

Farm Hauling Enters a New Era

TODAY progressive farmers are placing old farming methods on trial. Value must be proved or the old must go. In these times of high costs the wastes of past years must fall by the wayside.

In the search for economies, the always-important work of farm hauling is being rigorously revised. On many farms, International Motor Truck haulage has already ushered in a new era of energetic movement—of time- and work-saving efficiency.

By this transportation short-cut, stock is marketed in less time and with less shrinkage—crops are hauled when prices

are right—supplies are delivered promptly when needed—hard-hauling jobs are made easy and long trips short.

The fact that International Motor Trucks are the product of a concern that has a broad-as-agriculture reputation for fair dealing, good value, and the production of dependable labor-saving farm equipment, should be ample assurance that these trucks will in all cases provide low-cost hauling service.

The sizes range from 3/4-ton to 3 1/2-tons capacities and there is a style of body for every hauling requirement.

Of Interest to Farm Women and Girls

Looking Into the Future

A YOUNG MOTHER who refused to spread her meals on an untidy cloth, do without the little niceties of table manners and usage, and generally held herself to a system that her friends thought burdensome, explained her position to a friend one day. "You see, I must teach these children good manners, because some day they may occupy positions of responsibility where good manners mean more than wealth or even education. Quite likely we will never have anything to leave them but what education and home training we can give them, so I am determined to make the most of what little we can do for them."

Now that woman was a tenant's wife and had little to do with, but her home was clean, cheerful, neat, orderly and happy. The table had flowers in season if nothing more than a bunch of clovers, the cloth was clean and the dishes were not cracked and stained, though they were only the ten-cent store variety. Every member of the family took pride in the dainty belongings that

trusted to your care, but no amount of money could buy the priceless inheritance that the children of right-minded parents enter into even while they are still too young to appreciate it.—Hilda Richmond.

USING THE OLD HENS

In culling out the old and heavy fat hens the market price will usually be found much lower than for the yearling ones, so it is profitable to use them on the home table rather than sacrifice them in market. Every year when the flock is gone over a few will slip thru, and tho they may lay for a short time in spring they are far more profitable to furnish variety in the salt meat diet than for egg production.

Old hens must be cooked until the meat will drop from the bone to be really worth much and must be served with thick, rich gravy to be fully appreciated. A big fat hen will make a company dinner, or two meals for the ordinary family. The best pieces can be cooked with gravy

Milk Products Booth, Morris Co., N. J. Home Economics Exhibit

they were of the cheapest, and in that home nobody needed a lecture about trying to be orderly.

If there is any individual to be pitied it is the self-conscious boy or girl who has never received the home training that is the birthright of every child. No matter if chicken raising is profitable, and the sale of butter an inducement to the wife and mother to neglect the home, the children have rights that must be respected. It may look like kindness to indulge the children and let them go to school when they please, stay at home when they please, eat, sleep and play as they please, but remember, the children so slighted and cheated will be the first to blame the parents when the awakening comes. The mother and father who have no vision of the future with their well-trained children occupying places of trust and responsibility in the community will never measure up to the highest standard of parenthood, but on the other hand the parents who hold themselves and their boys and girls to the better, finer things of life will reap their reward in the future. It takes time and patience and untiring effort to train the children en-

and dumplings for one day, while the poorer pieces can be worked up in pie, shredded chicken, or in noodle soup. Many ladies take the best parts of two hens for stewed chicken when there is company and use the poorer pieces later. This is a fine arrangement and makes the chicken platter look very attractive when guests are present, while the bony pieces have just as good meat for the family, and some people like it better.

First of all, clean and cool the chicken properly so there is no danger of ptomaine poisoning. Put the pieces into a kettle and cook until done. Remove the chicken to a warm place and make the dumplings and gravy, or make all gravy with the broth and serve with hot baking powder biscuits split in half. This is an old-fashioned company dish that is coming back to the great delight of the older people. Chicken with rice is also good, and so is chicken with waffles or chicken with macaroni. This refers to the best pieces where looks count. Chicken with rich gravy served with tender brown waffles is a dish fit for a king. Now for the bony pieces. Cook

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

NEW SUITS FOR LITTLE BOYS

3503.—Smart Suit for Small Boy.—Pattern is cut in 5 sizes: 3, 4, 5, 6 and 7 years. A 4-year size will require 2 yards of 44-inch material. Serge, chevot, flannel, pongee, seersucker, galeata and linen. Pattern, 10 cents.

3556.—Comfortable for the Lad.—Pattern is cut in 4 sizes: 2, 4, 6 and 8 years. A 6-year size will require 2 1/2 yards of 36-inch material. One could use drill, jean, or madras for the blouse, and flannel, serge or khaki for the trousers; or make the entire suit of serge, gingham, linen or flannel. Pattern, 10 cents.

3557.—Box Jacket.—This model uses the popular fad for embroidery or beading on the loose box jackets seen on the spring suits. The pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size will require 2 1/2 yards of 40-inch material. Pattern, 10 cents.

3496.—Simple School Dress.—It is cut in 4 sizes: 8, 10, 12 and 14 years. A 12-year size will require 2 1/2 yards for the Middy and 3 1/2 yards of 27-inch material for the skirt, collar and cuffs. Plaid, sating, gingham or chambray; serge and plaid or check material combined, gabardine, linen and pongee are good for this style. Pattern, 10 cents.

How Everybody Can Wear Gray This Spring.—Gray is the fashionable color this spring, but only the fair and the pink-cheeked dare wear it without first adding a touch of brighter color to the neck or vest.

A House Cleaner Closet.—A closet set apart just for the housecleaning apparatus—dry mops, dusters, vacuum cleaner, brooms and brushes, to say nothing of ammonia, turpentine, scouring powders and soap—it is a housekeeper's dream that might just as well come true.

Window Cleaning Trick.—Rubbing windows every few days with a dry cloth takes but a minute, keeps them shining and put longer intervals between the tedious washing.

For Hard-Working Hands

EVERY day, farmers' hands need protection from grease and oil, cuts, bruises, and many minor injuries. Boss Work Gloves offer this protection.

They are made to stand the hardest, most rugged kinds of work. Yet they are exceptionally flexible. You can adjust a carburetor or handle a screw driver with ease while wearing them.

You will find them useful for a hundred different jobs such as repairing farm machinery, all barn work, plowing and harvesting, handling an axe, driving, painting, installing new equipment, digging post-holes and handling fencing.

Boss Work Gloves come in three styles of wrist—ribbed, band, and gauntlet. There are sizes for men and women, boys and girls. Ask your dealer for them by name.

THE BOSS MEEDY—best quality, medium weight canton flannel.
THE BOSS HEVY—very best quality, heavy weight canton flannel.
THE BOSS XTRA HEVY—finest grade of extra heavy canton flannel.
THE BOSS WALL-OPPER—highest quality, heaviest weight canton flannel.
THE BOSS LETHERPOM—heavy canton flannel with tough leather on palms, fingers and thumbs.
THE BOSS JERZY—highest quality cotton jersey cloth in many colors.
THE BOSS TIKMIT—Roomy mittens made of ticking that wears like iron.
THE BOSS ELASTO—strong canton flannel. Made by a patented process in one weight only.

CRABINE TRIPLE WALL SILOS

YOU can easily rebuild your old broken-down stave silo into a new, permanent Crabine—the handiest, strongest silo made—and save half the cost of a new silo. The Crabine is a great economy because its moderate first cost is its only cost for many years. The inner wall is of upright staves, closely fitted. Then comes a wall of Silafelt—waterproof, air-proof, frost-fighting. Outside is the spiral smooth-finish Cranelox covering that winds to the top—protecting and reinforcing every square inch. No hoops, no repairs—your silage is better, your investment is safer, your work and anxiety are reduced.

Ask us for full particulars of new or renewed silos. Write today for literature and price lists.

The "Meat of the Coconut"

EVERY dairyman should realize the importance of the proposed legislation, recently introduced in the Legislatures of Pennsylvania, New Jersey and New York, to prohibit the manufacture and sale of all compounds of skim milk and vegetable fats. The coconut oil interests are fighting the proposed laws most vigorously for their product is the one chiefly used to make up these compounds which are sold as substitutes for pure dairy products.

In Pennsylvania the measure is known as House Bill 497 and in New Jersey, Assembly Bill 526. Among these compounds or substitutes which are freely marketed in the State of New Jersey are the following substitutes for evaporated milk, made in the mid-western and far western states: Hebe, Carolene, Enzo, Nyco, Nutro and Silver Key.

Not only are these compounds offered for sale in small or "family size" packages or cans, but are sold in bulk for subsequent use in restaurants, in the cooking of milk dishes, in ice cream, as cream with coffee or cereals. They have been extensively used, it is stated, in the poorer class restaurants. One large concern operating in New Jersey has recently had its product, a mixture of cream and coconut oil, ruled out of New York City Markets by the Board of Health.

Comparative Nutritive Value

At recent hearing before the Agricultural Committees of the lower houses in Pennsylvania and New Jersey, Dr. McCollum, of John Hopkins University, testified as to danger to public health and human welfare of the use of such milk substitutes. We quote from him as follows:

"This practice of substituting vegetable fats for butter fat in milk has become a widespread evil within recent years, and has far-reaching consequences. The practice should be combated by every possible means because of the inferiority of such vegetable fats, from the nutritive standpoint, to butter fat.

"In 1913, I was able to demonstrate by experiments on animals that butter fat contains a substance which is essential for growth or for the maintenance of normal health in the adult. This substance is not found in adequate amounts in any of the cereal grains, peas, beans, potatoes, sweet potatoes and other seed, tuber and root vegetables which form so large a part of our diet. The only practical source of it in the nutrition of young children and infants is the fat of the milk which they consume. If by any chance the milk used for feeding infants or children is deprived of its fat and an inferior type of fat substituted, disastrous results are certain to follow if the food is thus made faulty for any appreciable length of time.

"I have studied very carefully both by means of animal experiments and with human subjects and thru a careful study of the effects of various types of restricted diets on man in different parts of the world, and am convinced that the use of liberal

amounts of milk and other dairy products forms a factor in our nutrition which is of greater importance than any similar fraction of the diet served from other sources. This is true because milk, especially because of the peculiar nature of its fats, furnishes an indispensable dietary factor, not abundant in any of the ordinary cheaper foods. I have become strenuously opposed to permitting the sale of skimmed milk with which has been incorporated vegetable fats in place of its original butter fat content, for such milk imitations are inferior to whole milk. I regard the sale of such products as nothing less than trafficking in infant life, for it has been shown by a number of investigations that such products are actually, whether intended by the manufacturers or not, sold for the feeding of infants in some instances.

"Any legislation permitting the substitution of vegetable fats for milk fats in any human food should be vigorously contested and opposed by everyone interested in human welfare."

Survey of Penna. and New Jersey

Evaporated milk substitutes have been found by investigation to be offered for sale in large quantities in grocery stores in Pennsylvania and New Jersey.

With a view of deceiving possible buyers, these substitutes are sold in packages of about the same size and content and with a similarity of labels. Sample cans of these goods are displayed by dealers on the shelves along with the standard brands of condensed and evaporated milk and generally at prices prominently displayed and lower than those obtained for standard brands of milk.

In every city, visited from Jersey City to Pittsburgh, the greatest majority of dealers handling substitutes was always in the poorer section among foreigners or the ignorant who would not be able to appreciate the full significance of the label. The method of their sale as proven by these facts clearly proves that they can be classed as a fraud.

Present State Laws

What has been done in the way of legislation in the other states in connection with these milk substitutes, compounds and imitations, is pertinent.

Ohio has probably gone farther in its campaign against these unfair and fraudulent substitutes than any other state. Section 12725 of the General Code of Ohio forbids the sale of condensed skimmed milk in Ohio. That the sale of Hebe under this law was prohibited, was tried in the District Court of Ohio and it was decided that Hebe was condensed skimmed milk and therefore within the condemnation of the Ohio Statute.

The opinion of the Court was in part:

"Whether Hebe is as wholesome and nutritious as condensed milk is unimportant, so long as it is used as an instrument of fraud. Producers of an article of food which may be used to deceive the public are not

favored in courts of equity."

Again in the same opinion:

"The Constitution of the United States does not secure to any one the privilege of manufacturing and selling an article offered in such a manner as to induce purchasers to believe they are buying something which is in fact different from that which is offered for sale."

The case was carried to the United States Supreme Court which upheld the decision of the District Court.

Wider Knowledge Needed

The public needs wider knowledge as to this traffic in substitutes.

The hearing in Harrisburg and Trenton, before the respective legislative committees, have not excited the widespread public interest there should have been. The members of the Legislature do not appear vitally interested themselves in the bills nor do they seem to have been hearing from their constituents.

These bills are necessary to prevent fraud and to protect the public health, to promote the normal growth of infants and children necessary and for the health of mankind, for the welfare of humanity.

RAISING DAIRY CALVES

By Melville Wettach

(Continued from Last Week.)

The following suggestions should be helpful in guiding the dairyman in the care of his calves.

- 1—Do not overfeed.
- 2—Do not feed the foam from separator milk.
- 3—Feed regularly and in small quantities.
- 4—Always feed at a temperature of 95 or 100 degrees F.
- 5—Keep feeding utensils scrupulously clean.
- 6—Give the feed in a clean, wholesome condition.
- 7—Give the calf water to drink.
- 8—Be regular in everything.
- 9—Do not allow the calves to suck udders. It may ruin a good udder and also cause bloating.
- 10—Weigh or measure all feed.
- 11—Boil all milk to prevent disease, especially if the skim milk is from outside sources.
- 12—Keep them growing. Every sickness is a setback.

Housing

If possible, it is best to have a separate barn for the calves. They do best in small pens and in small groups. In this way in case of disease, it is confined to a small area and the calves are easily handled. Where there are a number of calves, each one should have a stallion as this simplifies feeding and gives them all the same chance to get their share. Stallions help to do away with the practice of sucking udders. Calves will not, as a rule, do this if they are fed their milk and then their grain immediately following it. The pens should be easily accessible and well bedded at all times. Never allow the pens to become damp, particularly in the wintertime. The pen should be free from drafts, but cold air never hurts a calf provided it is dry. Sunlight is the best disinfectant so the house should afford good light as well as ventilation.

Calves of all ages need plenty of exercise and a good way to obtain this is to have a lot or pasture adjoining the calf barn which the calves can have access to in good weather. If there is a large lawn available, a number of the young

calves can be staked out and left there all of the time as long as the weather permits. Always see that the calf has a fresh grazing area when necessary. Never leave them out so that they get a cold, drizzly rain on their backs as this is a good way to give them pneumonia.

Management

Those calves which are not purebred should be dehorned when they are from three days to two weeks old, by rubbing the "buttons" with a stick of moistened caustic potash. The stick should be wrapped with paper to protect the operator and the "buttons" only rubbed until they appear slightly red. Be careful that the potash is not wet so that it will run into the eyes of the calf as this will cause blindness. It is best to do the dehorning on a cool day, if possible, so that the flies will not annoy the calf. The months of July, August and September are the months when the calves need the most attention as these are the fly and sick months.

In the winter more care is necessary than in the summer, as a rule. The worst time is during the months of January, February and the early part of March. The trouble at this time is principally from lice and white scours. Be sure that the calves have warm, dry, light, well ventilated quarters to go into in the fall and the trouble will be greatly reduced. If there is a sudden drop in the weather, make a corresponding one in the calves' feed and gradually raise the quantity as weather regains its normal temperature.

Sickness and Disease

The general symptoms of sickness show up usually with one of the following, a hot and dry nose, loss of appetite, dull eye and a ruffled coat, a doxy appearance, coughing or scouring. The following are the common ailments of calves.

Bloat may be caused by sucking cars or udders, drinking foamy milk, eating wet alfalfa or having the run of an alfalfa field when hungry, or from eating mouldy feed. The first thing to do is to try to reduce the amount of gas formed in the calf by keeping the calf moving. Do not allow it to lie down. In calves under two months of age an injection may help but it is useless on calves over this age as they have the four stomachs well developed by this time. A good remedy is a solution of one teaspoonful each of turpentine and 20 per cent creolin with four table-spoonfuls of castor oil. Mix this with a little milk to prevent it from sticking to the sides of the bottle. The best way to administer a drench is by means of a long necked bottle. Insert the neck in the calf's cheek and keep the calf's head slightly elevated. Never hold its tongue as this only hinders swallowing. Stroke the calf's throat will induce swallowing. Keep the calf moving.

Ringworm is a fungus disease of the skin, attacking the calves principally over the head and forequarters. It appears as a grayish scab and spreads, causing the hair to fall out. To treat this, wash the scabs with warm, soapy water and paint with iodine. This treatment must be kept up if any results are to be secured.

(Continued Next Week.)

"Experience teaches that it is men and women who pay attention to small savings that become wealthy. By saving nickels and dimes, a thrifty person lays the foundation of a fortune."—James A. Garfield.

SCHUMACHER PRICES ARE DOWN

DOWN go Schumacher Feed prices to pre-war basis—
DOWN to a level with the prices you get for the products you sell—
DOWN where Schumacher is a much cheaper feed than ground corn or oats, middlings or bran—
DOWN to a point where you cannot afford to miss the BIG SAVING today's prices give you on a feed that has

MORE food value than bran or middlings.
MORE food value than oats.
MORE food value than wheat feeds.
MORE food value than brewer's grains.

The Cheapest Feed to Feed

Therefore, don't let the fact that you have plenty of corn or oats keep you from buying Schumacher Feed at today's surprisingly low prices. Fed with gluten and cottonseed meal as your protein concentrates, it makes the cheapest feed you can feed. If you have a surplus of home-grown grain, it will pay you to sell some of it and buy Schumacher Feed. For instance:

Take the question of moisture. 95% of the corn inspected for market grading contains 19½% water—19½ lbs. of water in every 100 lbs. of corn. Better to sell water than to feed it, don't you think? Schumacher Feed is kiln-dried. It is ALL feed.

Now, take the question of digestibility. Schumacher contains 4% more digestible matter than oats; 6½% more than middlings; 12½% more than brewer's grains; 21% more than bran. It is made from the choicest feeding parts of Corn, Oats, Barley, Wheat, with Hominy, Wheat Flour, Middlings and Linseed Meal added, finely ground, scientifically blended.

Start Reducing Your Feed Costs Today by buying Schumacher and you will also start better results from your cows. If your dealer cannot supply you, write to us.

"The milker has always been ready to do its duty at milking time without any grudge. It has done its work well, milked clean and absolutely kept up the milk flow."—WILLIAM GRANT.

A Hired Man That Milks Thoroughly and Satisfactorily

PERFECTION is the hired man that milks your cows thoroughly and satisfactorily. That means, good milk flow, uniform milking, and clean milking at all times.

That's the kind of milking you want twice a day every milking day of the year. Why bother with hand milking and all its drudgery. Let Perfection solve your milking problems.

Perfection will milk your most valuable cows thoroughly and to your entire satisfaction.

It uses the same gentle action as the calf, a gentle suction followed by a downward squeeze followed by a period of rest. That is why cows like the Perfection and give their milk down freely.

It's an easy task for one man to thoroughly milk 24 cows in an hour's time with the Perfection. This is your opportunity to increase your herd or to milk the same herd with less labor and always get a thorough, satisfactory job of milking.

Find Out More About the Perfection Write and let us send you a free copy of "What the Dairyman Wants to Know." It answers all milking machine questions. We'll also send you a list of Perfection owners' names and addresses near you.

Why Milk By Hand? Perfection milks more thoroughly.

Soy beans, early and late varieties. No. 1 stock. Prices on request.
J. P. COUNCIL COMPANY
Frost Proof, Virginia

TALKS WITH THE BOYS

LETTERS FROM THE BOYS

Dear Editor—I saw several letters written to you by boys, so I thought I would write one also.

I lived on a farm of 104 acres and had five horses, one colt and fifteen head of cattle. I liked it on the farm and so did father, but my mother did not, so we sold it about two years ago. We are living in the city now, but I do not like it and would rather live in the country. I spend my vacations in the country and like it lots. I have a pair of bantam chickens and I am getting eggs every day.—H. B. Snyder, New Jersey.

Dear Editor—I thought of putting a letter into your paper so the other boys can read it on the Boys' Page. I enjoy reading the page very much and find it very interesting.

I am fourteen years of age and go to the rural school and to Sunday School on Sundays. I cannot see a hard task in being educated. I have two other brothers—one at home and one in the city. We have eighty acres of farming land. We have three horses, ten head of cattle and I have a pig of my own. I appreciate having something of my own. Last year I had rabbits and they brought me a great deal of money.—Sam S. Berks County, Pa.

Dear Editor—I am a boy eleven years old from New York State. I was born in the town of McDonough. My father died about three years ago and Mother died in October soon after my little baby brother was born, two and a half years ago. I have two sisters in Middletown and one in Buffalo, also two brothers in McDonough and one in Coventry.

I went to live with my Aunt, but did not stay there long and at last came to East Pharsalia where I have been for two years. I like the place where I am staying very well.

I got a calf last year and joined the Calf Club. She took \$18 in prizes at the fair.

I got up three subscriptions for the Pennsylvania Farmer and got a fountain pen and I appreciate it very much. I go to school most of the time and have one mile to go. I like the teacher very well. I am in the fifth and sixth grades. I go to Sunday School every Sunday. I think your letter in the March 19th issue would be good counsel for the boys around here. Hurrah, for New York State!—J. Stewart Burk, N. Y.

Dear Editor—I have been reading the boys' letters for some time and have decided to write one also. I live a long way off, but I would like to help to fill the Boys' Page.

I am fourteen years of age and live on a 200-acre farm, five miles from the village. We have fifteen cows and two horses. The school house is a mile and a half from our farm and I am in the seventh and eighth grade. I have a sister older than I am. Hoping your Boys' Page will be a great success, I am—Alton Willey, Greensboro Bend, Vt.

Dear Editor—I am a little York State boy and enjoy reading the boys' letters in the Pennsylvania Farmer very much. My father has been taking the paper for a long time.

I have three sisters older and two younger than I am and then I have

one dear, little brother, two months old. We live on a farm of 100 acres, about three-quarters of a mile from a railroad town. At present, we all have the whooping cough.

I have a cow which was given me when it was a calf. I sold her first calf this spring for \$3.00 which I put in the bank.—Floyd J. Randall.

Dear Editor—I have read the Boys' Page every time it has been published and thought I would write a letter to help fill the page.

I am fourteen years old and am in the eighth grade. I have received several cards for perfect attendance. I live about one mile from the school. I like to go to school, but would rather work on a farm.

We live on an eighty-acre farm and have twenty acres of woods. I raise some potatoes every year, but am going to raise some corn this year. We have three horses, two mules and eight cows.—T. F. S., Delaware.

Dear Editor—My papa is taking this farm paper and we like it very much. I am glad there is a page for the boys.

I am eleven years old and will be twelve July 19th. I help to do the chores and do nearly all the harrowing and break stones to fill up the ruts on our road. I have to do a good bit of work since I can't go to school as we have the whooping cough.

I have one brother and two sisters and their names are: Dwight, Ruth and Erma.

We have two gasoline engines, one for the washing, and one for unloading wheat. We also have an automobile, three horses, seven head of cattle and three calves.—Clayton Shetler, Somerset Co., Pa.

Dear Editor—I have become interested in the Boys' Department of Pennsylvania Farmer, so I thought you would like to hear from New York State.

I am thirteen years old and live on a farm of 174 acres, two miles from Unadilla High School. I am in the sixth grade.

We have thirty-six head of cattle and two horses. We also have a milking machine, three engines and an automobile. My brother and I each have a calf to raise.—Francis Stewart, Del. Co., New York.

Dear Editor—I read the Boys' Page in the Pennsylvania Farmer every week so I thought I would write a letter, too.

I am ten years old and live on a hillside farm of 100 acres in northern Pennsylvania. I have about two miles to walk to school. I have two brothers and one sister younger than I am. I have a little black and white rabbit for a pet.

We have a gasoline engine with which we saw wood and run the washing machine. We also have three cows, three horses, three hogs and seventy-five chickens. I hope you will continue to have a page for the boys.—Leonard Ada, Bradford Co., Pa.

Jack—Why is a figure 9 like a peacock?

Jim—Don't know, why?

Jack—Because it is nothing without a tail.—Boys' Life.

PASSING EVENTS IN PICTURES

1—Nell Arnold (left) plays Edith Slater an exciting game of "Biff" while the Gallery looks on. The girls attend the Castle School, Tarrytown, N. Y.
2—Mary Pickford and Jack Herron going over the script of "Thru the Back Door."
3—This Sweater Suit is just the thing for early summer wear—and for sports it has achieved great popularity.

4—One of the Government buildings in the Republic of Argentina, South America.
5—The great Municipal Pier of Chicago is growing in popular favor each day and aside from being a great attraction for visitors, is being utilized for many civic enterprises.
6—Little Mary E. Redding, of New York,

feels much at home atop this steed.
7—Hand-carved bowl of pipe, owned by a Boston citizen. The head is of rare completeness and beauty.
8—Huge Lawson Airplane to start regular New York-Chicago passenger service.
9—Amateur Camera fiends waiting to catch a glimpse of the President.

Lowe Brothers

A brand new car for less than \$4

NEIGHBOR Bill told me about the bargain. Told me, Wednesday. So, Thursday, I hid my old car good-bye. We shut the door on it, and never looked at it until Saturday morning, when it was time to go to the Sunday School picnic. Wife was considerably fussed. Declared the car wouldn't be fit to use. When I opened the door, there it was, just wreathed in smiles, and hard as you please. Maybe we didn't feel all

Markets

PHILADELPHIA PRODUCE

—Philadelphia, April 4, 1921.

Since our last week's report, the season on the new crop of potatoes has started, the first car of the season from Florida arriving here the latter part of the week and selling at \$12@13 per bu. for No. 1s, and \$11@12 per bu. for No. 2s. This morning there were four more cars here and prices ranged from \$9@10 per bu. on No. 1s and \$8@9 per bu. on No. 2s. Supplies will no doubt get heavier before the week end and lower prices may be expected.

With the appearance of the new crop, the market on the old potatoes will begin to wane. This morning there were around 60 cars of old potatoes here most of which are Penna. grown stock, and prices ranged from 90¢@1.15 per cwt. mostly with some fancy 1.15 higher. No. 1s and No. 2s are main steady and unchanged at 35¢@50¢ per 50-lb. cwt.

Sweet potatoes are meeting a good demand and rule firm for the fancy and prime stock, but the mediums and No. 2s are weaker. Prices sold at \$1.05@1.25 per bu. for Eastern Shore stock with No. 2 Eastern Shore at 65¢@50¢ per bu. Nearly 50 baskets ranged from \$1.35@1.65 for No. 1s with mediums at 75¢@81¢ and No. 2s at 40¢@45¢.

Vegetables—There were three cars of asparagus here this morning prices on which ranged all the way from \$1.00 per dozen bunches. The warm weather now prevailing will soon bring forth New Jersey asparagus. Beans are more plentiful and lower at \$2@4.00 per bu. The old crop of nearby beans remains steady and unchanged at mostly \$1.25@2.00 per bu. New beans from southern points are also steady at mostly 30¢@35¢ per bu. Cabbage after having been extremely low during the past several days met a firmer and higher market today, selling at \$1.25@1.50 per half-barrel hmp. and \$1.75@2.25 per crate. Most nearby carrots are poor and sell slowly at \$1.50@2.00 per bu. but strictly fancy are exceedingly scarce and such would easily bring \$4@5 per bu. Cauliflower is scarce and highest best green stock selling at \$2.50@2.75 per crate. Celery has also taken a sharp advance during the past week and best stock is now selling at \$2.50@3.25 per crate. Cucumbers are getting more plentiful and prices are gradually easing off, good cucumbers selling today at \$3.50@4.50 per hmp. and poor at \$2.25@3.50, while the hot house stock range all the way from \$1.00 per dozen. Fancy eggplants are scarce, best bringing \$5@5.50 per crate while those are poor ones which only bring \$2.50@3.50 per crate. Kale is in ample supply and selling around \$1@1.25 per bu. Southern lettuce is firmer and higher at \$1.50@3.25 per hmp. Some nearby but let lettuce has been on the market but as yet quality is poor, but in another week should be here in larger supply and better quality. Old onions are plentiful and sprouted and hard to sell at 50¢@55¢ sack. New onions are ranging from \$2@3 per crate. Mushrooms remain firm and active at \$1.50@2.25 per lb. Parsley is firmer and higher at \$3@4 per bu. One car of peas from Mississippi sold here this morning at \$4 per bu. some from South Carolina sold at \$3.50@4.50 per hmp. and some from California sold at \$6 per crate. Peppers are firm when fancy at \$4@6 per crate while choice and culls are slow at \$1.50@2.50 per crate. Radishes from the Norfolk section are now very plentiful being about 3 cars here this morning and red radishes sold at 75¢@1.25 per hmp. and white radishes at \$1.25@1.50 per hmp. Penna. grown rhubarb is on the market, but as yet is rather thin and small and sales mostly at 30¢@40¢ per bu. Romaine is firmer and higher at \$1.50@2.00 per hmp. Nearby scallions are very plentiful and lower at mostly 10¢@15¢ per bunch. Fancy tomatoes are firm at \$5@5.75 per crate with choice at \$4.25@4.75 and culls and small ones at \$1.50@3.00 per crate. There were about 12 cars of Norfolk spinach here this morning most of which sold at \$1.75 per bu. with some at \$2 and one car black pack at \$1.50 per bu. Watercress remains practically unchanged at mostly 2@3¢ per bunch. Yams are in light supply but move slowly at \$3.50@4.50 per bu.

Fruits—The only fresh fruit now on the market consists of apples and a few strawberries besides oranges, grapefruit and pineapples. The market is ruling firm on apples as follows: Per bu.; Baldwin, \$3@3.75; Ben Davis, \$3@3.75; Greenings, \$3@4.50; Russets, \$3@4; Spitz, \$4@4.50; Per bushel; Baldwin, \$1.15@1.75; Rome Beauty, \$1.50@1.65; Stayman Winesaps, \$1.50@2; York Imperial, \$1.25@1.50. Other varieties, \$1.25@1.75. There were two fresh cars of strawberries here today which sold at 43¢@60¢ qt. and 23¢@25¢ pint.

Poultry—The market on live poultry is ruling about steady at the following prices: Fowls, fancy, 30¢@35¢; medium fowls, 34¢@35¢; broiling chickens, 50¢@55¢; young roosters, 30¢@35¢; stags, 20¢@25¢; old roosters, 34¢@35¢; ducks, 40¢@45¢. Dressed poultry remains unchanged as follows: Fowls, 33¢@41¢; capons, 53¢@55¢; roosters, 28¢@30¢.

Eggs—There is a good demand for eggs which keeps the market well cleared up at about the following prices at the present writing: Nearby current receipts, 27¢; nearby firsts, 28¢; fancy selected, 29¢; nearby eggs, 36¢@37¢; western firsts, 26¢@27¢; western extra firsts, 27¢@27½¢; southern eggs, 22¢@25¢.

LANCASTER PRODUCE

—April 2, 1921.

With a plentiful supply of eggs on the local markets this morning, the price dropped to 25 cents a dozen at many of the stalls. Vegetables of the season were plentiful with an abundance of dandelion and cut spring flowers. A slight falling off in the prices of potatoes, spinach and onions was noted. Chickens remained high bringing up to \$2.35 each. The quotations:

Butter—Creamery Country butter, 55¢@60¢ lb.; creamery butter, 60¢ lb.; eggs, 25¢@28¢ doz.; duck eggs, 40¢@45¢ doz.; goose eggs, 40¢@50¢ each.

PITTSBURGH PRODUCE

—April 2, 1921.

Swiss, 50¢@52¢; Swiss, 5-lb. brick, 32¢@33¢; Longhorns, 30¢@31¢; Limburgers, 1-lb., 33¢; Eggs—Fresh select, 29¢@30¢; current receipts, 24¢@25¢.

YORK PRODUCE

—April 4, 1921.

There has been little change in prices and conditions since last week. The home grown produce yet in the hands of the truckers is dull and low in price. The southern goods are coming in pretty fast. The high prices and a finding a rather ready sale. Eggs—20¢@24¢ per dozen. Butter—Country, 50¢@55¢ lb.; separator, 55¢@60¢ lb.; milk, 10¢ qt. Poultry—Hens, 20¢@32¢ lb.; dressed, \$1.50@1.80 each.

Vegetables—Potatoes, 5¢@9¢ ½-pk.; 25¢@60¢ bu.; cabbage, 20¢@28¢ hd.; lettuce, 8¢@25¢ hd.; onions, 5¢@8¢; beets, 5¢ box; beans, 20¢@25¢; pea beans, 15¢@20¢ qt.; lard, 15¢@18¢ lb.; ham, sliced, 40¢@45¢ lb.; whole, 40¢@45¢ lb.

Wholesale Grain Market—Wheat, \$1.65; corn, 55¢; oats, 55¢; rye, \$1.25; bran, \$35 ton; middlings, \$39 ton.

NEW YORK PRODUCE

—April 4, 1921.

Butter firm. Receipts, 3817. Creamery, higher than extras, 51¢@52½¢; creamery, extras, 52¢@53½¢; firsts, 48¢@51¢; 188 lb. cur. make, No. 2, 21¢.

Eggs steady. Receipts, 24,836. Fresh gathered, extra firsts, 29½¢@30¢; firsts, 26½¢@29¢; state, Penna. and nearby western hennery whites, firsts to extras, 32¢@38¢; state, Penna. and nearby western hennery browns, extras, 34¢; do gathered browns and mixed colors, firsts to extras, 28¢@32¢; sternage packed, extra firsts, 31¢@31½¢; do firsts, 29½¢@30½¢.

Sheep and Lambs—Receipts, 4835; steady: sheep, ewes, \$4@6; culls, \$6.50@7; 100-lb. hogs, \$5.60@6.10; medium, \$5.60@6.10; heavy hogs, \$10.50; roughs, \$8@8.50.

PHILADELPHIA LIVESTOCK
Receipts for week ended April 2:
Total for week 2245 7646 8152
Previous week 1876 514 4487
Cattle—1764 head as against 2244 previous week.

Beef Cattle—Steers and cows were dull and receding, due to liberal offerings and increased pressure to sell. Mutton was slow of sale and weaker, with supplies largely of medium and inferior stock, which had to be moved out on buyers' terms. Quotations: Steers, good to choice, \$9@10; common to good, \$6@8; do local, 5¢@6; bulls, 5½¢@7; calves, extra to choice, \$12.50@13; fair to good, \$11@12; common, \$8@10; Tennessee choice, \$11@11.50; other southern, \$6@8.

Sheep and Lambs—There was a fair demand for sheep and lambs of desirable quality and values generally ruled steady, with supplies moderate. We quote: Shorn sheep, weathers, extra, \$6@6.25; do good to choice, \$3@5.50; medium, \$3.50@4.50; do common, \$2@2.50; ewes, heavy fat, \$4@4.50; lambs, spring choice, \$10@10.25; medium, \$8@9.50; common, \$5@5.50; hot house per head, \$6@10.

Hogs—Trade was slow and the market was weak and easier, due to heaviest outside advances and more liberal offerings. We quote: Best western, \$12.50@13; nearby good, \$11@11.75.

City Dressed Stock—Steers, heifers and cows ruled steady, with moderate supplies, but trade was quiet. Lamb of desirable quality was in fair request and steady. Mutton was dull and easier, with supplies in excess of requirements. Other kinds were quiet and without important change. We quote: Steers, 15¢@20¢; heifers, 12¢@14¢; cows, 12¢@14¢; calves, city dressed, choice, 24¢@25¢; country dressed, 20¢@21¢; lambs, 24¢@25¢; common, \$5@5.50; hot house per head, \$6@10.

Butter—Trade was slow and the market was weak and easier, due to heaviest outside advances and more liberal offerings. We quote: Best western, \$12.50@13; nearby good, \$11@11.75.

NEW YORK HAY AND GRAIN

—April 2, 1921.

Feed—The demand for mill feed was again very slow and buyers continued to hold off notwithstanding the fact that prices were at low levels.
Hay—City feed barn, \$28; mid-dlings, \$27; in 100-lb. sacks; red dog, \$28; nominal, in 100-lb. sacks; Western swing hogs, standard middling, \$27; flour middlings, \$31.50; red dog, \$28; oil in 100-lb. sacks, 30-day shipment. Oat feed, \$13; rye middling, \$26; white hominy, feed, \$30; in 100-lb. sacks. Cottonseed oil meal, 35 per cent protein, \$32; linseed oil meal, \$43, in 100-lb. sacks.
Hay and Straw—There were about 55 cars in the yard at 33d street this morning and about 25 cars were unloaded yesterday. There is very little trade and the market is generally in buyers' favor. In Brooklyn offerings are light and it is possible that a moderate demand for it is correspondingly light. Oat and wheat straw largely nominal.

Hay—Large bales, timothy, No. 1, \$30@32; No. 2, 28¢@29; No. 3, 25¢@26; shipping, \$21@23; no grade, \$15@18; clover, mixed, fancy, No. 1, \$20@22; No. 2, \$18@20; alfalfa, second cutting, \$24@26; first cutting, \$18@20.

Straw—Large bales, No. 1 rye, \$19@20; No. 1 rye, \$18@19; No. 2 rye, \$17@18; wheat—No. 2 red, c. i. f., \$1.64; No. 2 hard winter, \$1.66; No. 2 mixed winter, \$1.67; No. 2 yellow, 78½¢; No. 2 mixed, 78¢; No. 2 white, 78½¢.

Oats—No. 1 white, 51¢; No. 2 white, 50½¢; No. 3 white, 49¢@49½¢; No. 4 white, 47¢@47½¢; ordinary white clipped, 52¢; 52½¢; fancy white clipped, 53¢@53½¢; No. 1 f. \$1.59; barley—C i f, malt-ing, 79¢@86¢; feeding 69¢@75¢.

Beef Sheep & Hogs
Cattle—Receipts, 4270; steers, \$7.50@9.85; bulls, \$4.50@6.35; cows, \$1.75@6.50.

Hogs—Receipts, 7400; steady: veals, \$6@6.75; 100-lb. hogs, \$5.60@6.10; medium, \$5.60@6.10.

Sheep and Lambs—Receipts, 4835; steady: sheep, ewes, \$4@6; culls, \$6.50@7; 100-lb. hogs, \$5.60@6.10; medium, \$5.60@6.10; heavy hogs, \$10.50; roughs, \$8@8.50.

PHILADELPHIA DAIRY MARKET
—April 2, 1921.

Butter—Receipts, 1154 tubs. Supplies of fine goods were well cleaned up and the market ruled firm and higher. Quotations: Solid-packed creamery, fancy high-scored, 51¢@52½¢; do good to choice, 49¢@51¢; do local, 50¢@51¢; extra firsts, 43¢@49½¢; firsts, 44¢@48¢; seconds, 38¢@42¢; do local, 50¢@51¢; do common, 38¢@42¢; fancy, 52¢@54½¢; fair to good, 41¢@51½¢; ladies packed, as to quality, 22¢@24¢; packing stock, 16¢@20¢; family brands of nearby prints were jobbing at 61¢@62¢, and fair to choice, 51¢@60¢.

Cheese—Dull and without important change. Quotations: New England whole milk fats, fancy held, 24¢@29¢; do fair to good held, 24¢@27¢; do fancy fresh, 23¢@24¢; do medium, 22¢@23¢; do fresh, 22¢@23¢; Longhorns held, 20½¢; fair fresh, 22¢@23¢; single dairies held, 27½¢@28½¢; do fresh, 23½¢@24½¢; jobbing sales of fancy held goods, 30¢@31¢.

Hogs—Trade was slow and the market was weak and easier, due to heaviest outside advances and more liberal offerings. We quote: Best western, \$12.50@13; nearby good, \$11@11.75.

City Dressed Stock—Steers, heifers and cows ruled steady, with moderate supplies, but trade was quiet. Lamb of desirable quality was in fair request and steady. Mutton was dull and easier, with supplies in excess of requirements. Other kinds were quiet and without important change. We quote: Steers, 15¢@20¢; heifers, 12¢@14¢; cows, 12¢@14¢; calves, city dressed, choice, 24¢@25¢; country dressed, 20¢@21¢; lambs, 24¢@25¢; common, \$5@5.50; hot house per head, \$6@10.

Butter—Trade was slow and the market was weak and easier, due to heaviest outside advances and more liberal offerings. We quote: Best western, \$12.50@13; nearby good, \$11@11.75.

City Dressed Stock—Steers, heifers and cows ruled steady, with moderate supplies, but trade was quiet. Lamb of desirable quality was in fair request and steady. Mutton was dull and easier, with supplies in excess of requirements. Other kinds were quiet and without important change. We quote: Steers, 15¢@20¢; heifers, 12¢@14¢; cows, 12¢@14¢; calves, city dressed, choice, 24¢@25¢; country dressed, 20¢@21¢; lambs, 24¢@25¢; common, \$5@5.50; hot house per head, \$6@10.

Butter—Trade was slow and the market was weak and easier, due to heaviest outside advances and more liberal offerings. We quote: Best western, \$12.50@13; nearby good, \$11@11.75.

City Dressed Stock—Steers, heifers and cows ruled steady, with moderate supplies, but trade was quiet. Lamb of desirable quality was in fair request and steady. Mutton was dull and easier, with supplies in excess of requirements. Other kinds were quiet and without important change. City Dressed Stock—Steers, heifers and cows ruled steady, with moderate supplies, but trade was quiet. Lamb of desirable quality was in fair request and

After that meeting of the sewing circle at Mrs. Brown's no less than twenty members bought Andes Furnaces

"My sakes, Mrs. Brown, it's nice and warm in here—our house is like an iceberg!"

and were shivering in sweaters and coats, hoping it would be warm again soon, so they wouldn't have to start up their fires again.

But down at Mrs. Brown's house it was as cozy and warm as could be. It pleased Mrs. Brown a great deal because every member who came remarked on how comfortable it was, and they used practically the same words. They would say, "My sakes, Mrs. Brown, it's nice and warm in here—our house is like an iceberg!"

It pleased Mrs. Brown so much, that later in the afternoon she said, "Ladies, every one of you has said how nice and warm the house is—it's that new Andes Furnace, it's wonderful. I built that fire myself this forenoon—just a little fire. And inside of half an hour it took the chill off the house. But I think the best part of it all is that it kept us warmer this

winter and cost us less than ever before. And it's so nice this time of year to have a little fire in the morning or at night to take the chill off the house."

"Do you mean," someone asked, "that this house has been as warm and comfortable as this all winter long?"

Gives heat like warm, summer sunshine.

"Yes, all winter long," said Mrs. Brown, "even on the very coldest nights. The house hasn't been cold once. And it really has saved us money, too—not a fortune, of course, but it's saved us enough to be really worth while."

ANDES
SYSTEM
ONE PIPE FURNACE
"Better Heating for Less Money"

"Well, I'd like to know how to get one," someone else said, "because I've made up my mind that I will not go through another winter with the house as cold and uncomfortable as it has been this winter. I simply can't stand it."

"Then this is just the time to have an Andes put in. That's another fine thing about it. It can be put in complete in one day with no confusion or expense of cutting open the floors and walls to put in heating pipes. And just at this time of the year, you can get a special discount, if enough of you buy them at the same time. If they ship a whole carload to town, I think they told me it was twenty furnaces, they can afford to give this discount, but only in April and May. If you want me to, I'll write to them tonight and get each of you a copy of their book, 'Better Heating for Less Money' and full details about the carload plan and the discount."

And that's how it happened that twenty members of the Sewing Circle bought Andes furnaces. People are writing to us all the time about the Andes. Here is what Mr. S. Weiss of Reading, Pa., says: "Gentlemen—Your Andes One Pipe Furnaces have certainly done the trick. I used six of them this winter and our tenants are more than pleased."

The Andes is guaranteed to give perfect satisfaction or it will be taken out and the full purchase price returned to you.

Why not get ready now to make next winter comfortable? Write us today about the car load plan or, if you prefer, about just one furnace for yourself. Use the coupon below.

Two Essentials in Potato Growing

Good Seed and Thoro Spraying Are Necessary for Best Results

By P. L. EDINGER

THE remarkable value of good seed and thoro spraying was strikingly and convincingly shown last fall when a farmers' demonstration field meeting was held on the Niesley Brothers farm near Churchtown, Cumberland County, Pa., under the direction of the local Farm Bureau, at which time results were secured on the relative values of good seed (i. e. disease-free) versus diseased seed (i. e. field-run) and also on spraying versus no spraying.

A difference of 117 bushels of potatoes per acre due exclusively to the use of disease-free seed was one of the striking facts brought out at the time of the field meeting, whereas the difference in yields of thoro sprayed versus unsprayed potatoes amounted to the rather remarkable figure of 117.2 bushels per acre. In other words, due only to the two factors—superior seed and thoro spraying—an increase of 234.2 bushels of potatoes per acre was made.

The idea in the minds of the Niesley Brothers at the time of planting was two-fold, namely, to demonstrate to the community that it pays to use good seed, and secondly, to determine the best source of good seed.

Seed-Source Test

With these ideas in mind a portion of the five-acre field in question was planted to local seed (which during the growing season was found to contain 40 per cent of the disease known as leaf-roll); a portion to good seed (that is, seed selected by the Extension Plant Pathologist of State College because of its freedom from disease) from Michigan; another portion to rogued seed (that is, seed from a field from which disease plants were removed) from Cambria County, Pa., and a fourth portion to rogued seed from Lehigh County, Pa. In all cases the seed used was of the same variety—the Rural (Bessett), so that the basis for comparison was uniform.

The following summary gives the yields of the different seed sources and the contrast with the local seed.

	Per acre
Yield of sprayed Lehigh Co. seed	450.2 bus.
Yield of sprayed Michigan seed	429.4 bus.
Yield of sprayed Cambria Co. seed	425.5 bus.
Average yield of three sources of disease-free seed—438.4 bushels per acre.	
Yield of local seed (field-run)—333.2 bushels per acre.	
Average difference due to superior seed—105.2 bushels per acre.	
Greatest difference due to superior seed—117 bushels per acre.	

The reason for the great difference is readily seen from the following figures taken from 50 hills of potatoes infected with leaf-roll—as found in the local seed—as compared with 50 hills of disease-free potatoes.

Fifty hills potatoes infected with leaf-roll—47 pounds tubers; fifty hills potatoes disease-free—129 lbs. tubers.

One of the accompanying cuts shows the relative yield of leaf-roll versus no leaf-roll of the 50 hills each.

Thoro Spraying

Because of the fact that late blight was severe in this section of the state this year the results of thoro spraying were equally as striking as those above mentioned. Six applications of home-mixed Bordeaux were made during the growing season the spraying being done with a power potato sprayer, with triple-action pump having two nozzles per row, spraying eight rows per round under a pressure of 200 pounds. Sprays were applied in general about every ten days, altho frequency of application was influenced to some extent by the rapidity of vine growth.

To determine the value of spray-

ing in its influence on yield a check of 4 rows—unsprayed thruout the season was left. At the time of the field meeting, data was secured on spraying versus no spraying and the following figures are evidences of the value of spraying in a year when late blight is so prevalent as it was in 1920.

	Per acre
Yield from Lehigh Co. seed, sprayed	450.2 bus.
Yield from Lehigh Co. seed, unsprayed	333.0 bus.
Difference due to proper spraying	117.2 bus.

Economy of Spraying

The important thing, after all, about spraying is, does it pay? A summary of the economy of the spraying done on the Niesley Bros. farm follows:

	Per acre cost
(Six applications) 50 lbs. lime @ 1c	.50
50 lbs. bluestone @ 10c	5.00
Depreciation on sprayer (\$213.75) @ 15%	6.41

Showing Contrast Between the Yields of Fifty Hills of Potatoes Infected With Leaf-roll and Fifty Hills of Disease-free Seed

Interest on sprayer at 6%	2.56
Man and horse labor	7.50
	\$21.97
Bush.	
Increase in yield per acre due to spraying	117.2
Value of increase @ \$1.00 per bushel	\$117.20
Cost of spraying per acre	\$21.97

Net profit per acre	\$95.23
Total net profit on 5 acres	\$476.15
Summary of results secured from good seed and proper spraying:	
Increase per acre due to good seed	117 bus.
Increase per acre due to spraying	117.2 bus.
Total increase due to these two essentials (per acre)	234.2 bus.
Probable yield had these two factors been omitted in 1920 (per acre)	216.0 bus.

NEW YORK POTATO MEN MEET

Members of the New York State Potato Growers' Association in their annual meeting at Ithaca, N. Y., decided to put the marketing of certified seed on a better business basis, and as a means of bringing this about resolved to incorporate un-

der Article 13-A of the membership co-operative law of New York State. The incorporation will be made effective for the sale of certified seed.

The five new directors who were elected to proceed with the incorporation, drew up and submitted to the association a set of by-laws adapted to the new business of the association. When the incorporation has been completed it will be the duty of these directors to elect officers and to employ a manager and sales agent to push the sale of seed stock, and it was planned to put a man in the field in time to handle the seed for this spring's planting.

Tighten Up Seed Requirements

The requirements for seed certification were made considerably more rigid. With respect to leaf-roll and mosaic the new provisions require roguing of the fields before the first inspection. Notice will be given the grower one week prior to the visit of the inspector. No changes were made with respect to grading and bagging requirements. Several changes were made, however, in the regulations covering the disqualification of fields, among which were the following:

The presence of 5 per cent of mosaic at first inspection or of more than 5 per cent at the second inspection will disqualify a field. The presence of more than 2 per cent of any of the following diseases or more than 4 per cent in all will disqualify; wilt, black leg, leaf-roll, early dwarf or hills weak from other causes. The same percentages govern at the second inspection. In regard to varietal mixture, only 3 per cent will now be tolerated at the first inspection and 0.5 per cent at the second inspection. The requirements in regard to other diseases, type, size of seed, etc., were generally tightened up.

Dr. F. C. Stewart told growers that in an experiment last season with 1000 small and 1000 large potatoes to determine their comparative worth as seed, he had obtained slightly better results in every respect with the small tubers. Enormous No. 9 was the variety used, and the results showed that when seed potatoes are grown in special seed plots with all weak and diseased plants removed, all of the potatoes grown may be used regardless of size. Small potatoes, however, should not be used for planting the seed plot. When seed is scarce and high in price and small potatoes can be obtained from high yielding fields, free from leaf-roll, mosaic and wilt, it is often advisable to use them rather than the more expensive large potatoes, said Dr. Stewart.

In these tests the large and small potatoes were planted in alternate rows of 100 potatoes each, the small ones being planted whole and the large ones divided into three parts. Of the rows of large potatoes one-third of them were planted to butt-end pieces, one-third to middle seed pieces and one-third to stem-end pieces.

Both the large and the small potatoes made nearly a full stand, but the smaller tubers came up a little sooner and yielded a slightly larger crop, the yields per acre being 530 bushels for the small whole potatoes and 514 for the large ones.

According to Daniel Dean of Nichols, N. Y., one of New York's best known potato growers, more money has been lost from lack of information as to size, movement and consumption of the potato crop than from the competition of Danish potatoes. Too much talk about the big crop is what brought down prices, and as a matter of fact there is really a shortage. On January 1, of this year, the supply was 145,000,000 bushels. Last year at the same time there were 127,000,000 bushels but the supply was practically exhausted by April and the prices rose to the highest level ever known. This year's supply is 30 million bushels less than two years ago.—H. T. B., New York.

The Yield from One Row of Unsprayed Potatoes on the Left which was 13 Bushels, as Compared to the Yield of One Sprayed Row on the Right—18 Bushels—a Difference of 5 Bushels Per Row

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

DECREASING AND INCREASING CROP YIELDS

IN NEWLY settled agricultural sections the methods of farming are usually extensive. The farmer tries to make man, animal or mechanical power as efficient as possible. Very often single cropping is followed under such conditions. Cash crops, like cotton, tobacco, corn, wheat, flax, potatoes or beets, are grown year after year until they cease to be profitable. As the yields begin to decrease diversification becomes desirable and often necessary and the cropping systems become modified to a more or less far-reaching extent. Examples of relatively high yields from virgin soils followed by gradually decreasing yields may be cited from our cotton belt, corn belt, wheat belt, etc.

In the course of time the decrease in the yields per acre is arrested and production assumes an upward trend. Instances of this sort are readily found in the eastern states or even in the great agricultural states of the Middle West. Even more striking are the curves of increased crop yields in certain of the European countries. Splendid examples of this sort are found in Denmark and in Germany. In the latter country the cultivated acreage was about the same in 1914 as it was in 1889. The number of persons engaged in farming also remained stationary. On the other hand, the production per acre increased to such an extent within this period as to have enabled the same number of farmers, cultivating the same number of acres, to feed 67 million people in 1914 as against 47 million people in 1889. Within the same period there was also a remarkable increase in the number of cattle and particularly of swine in the country. In other words, more human food as well as more animal food was being produced from the same area. Indeed, the yields per acre of rye, wheat, barley, potatoes and sugar beets practically doubled within that period.

There is scarcely room for difference of opinion as to the fact that, under modern conditions, agricultural practices in the older regions become more intensive. Certain factors contribute toward the increasing yields. Single cropping gives way to crop rotations whereby soil fertility is maintained more effectively and injuries from insects and fungous diseases diminished. Live stock becomes a more effective aid in helping to maintain the soil productivity. Methods for destroying noxious insects and weeds and of combating fungous diseases are sought out and applied. Fertilizers and green manures are used more frequently. The plowed depth of the soil is gradually increased, its water-holding capacity extended and the feeding area of plant roots made much greater.

In dealing with increasing production per acre consideration must, of course, be given to the question of cost. The largest yields are not necessarily the most profitable yields. For example, it has been shown time and again, both in this country and abroad, that by top-dressing wheat early in the spring with nitrate of soda at the rate of 100 pounds per acre the yield may be increased by five or six bushels per acre. Now, if 100 pounds of nitrate of soda cost \$5.00 and wheat is selling at \$1.00 a bushel, the increase in question would not be very profitable. The farmer might obtain better returns in that case from a 20-bushel crop than he would from a 25-bushel crop. On the other hand, if nitrate of soda costs \$3.00 per 100 pounds and wheat is selling at \$2.00 per bushel, the use of the nitrate would, under average conditions, be quite profitable. Hence, when extensive versus intensive methods of soil treatment are compared, due attention should be paid to the cost involved in securing the larger yields. The cost of labor and fertilizer on

the one hand and the prices brought by the crop on the other must determine the point at which yields per acre are likely to be most profitable. It happens that in the agricultural development of the United States cheap land, high-priced labor and the need for making the latter most efficient have determined acre yields. For different sections of the wheat area the 15-bushel crop has in past years been more profitable than would have been a 20-bushel crop, since the increase would have meant excessive labor and fertilizer costs.

It is evident, in view of what has been said above, that the cost of labor, the efficiency of labor, the cost of plant-food and the price which the crop finally brings all serve to determine to what extent cropping may be more or less extensive or more or less intensive. As our cities develop, as the drift cityward increases, as consumption tends to outrun production, the cost of food—which means the selling price of the crops must of necessity increase. This in turn is bound to lead to more intensive methods of soil tillage, to the use of more fertilizer per acre, to the selection of higher producing strains and to other practices which would stress more efficient use of land rather than more efficient use of labor. However, from the standpoint of national economy and from the standpoint of the consumer, with whom the farmer has a community of interest, increased yields per acre should be achieved without, if possible, increasing the unit cost of food. Can this be done?

Contrary to prevailing opinion, large-scale production and large yields per acre are not neces-

Mixing Fertilizer at the Plant of Chamberlain and Barclay, Cranbury, Station, New Jersey

sarily antagonistic. Sufficient progress has been made in the development of mechanical power to show that deep and thoro tillage may be achieved at a relatively low cost. There is every reason to believe that the tractor and other tillage machinery driven by mechanical power are still in an early stage of evolution. The next decade should make mechanical power a much cheaper and much more effective means for creating a good seed bed at a low cost. The development of new forms of fertilizer, their greater concentration and their greater solubility mean a lower unit cost of plant-food. Plant breeding and selection will give us better and better types of crops and varieties best suited for any particular soil or climatic conditions. Specialization in cropping must also lead to the more efficient use of the land, of plant-food and of labor. The trend, at any rate, is certain to be in the direction of larger yields per acre and, for the sake of the consumer as well as for the sake of the producer, we may entertain the hope that increased production will be accomplished without a corresponding increase in the unit cost of human food.—J. G. Lipman.

A HAND-MIXING FERTILIZER PLANT

By A. W. Blair

The accompanying photograph shows a part of the fertilizer mixing plant of Chamberlain and Barclay, Cranbury Station, N. J. Cranbury Station is located in the center of a splendid farm-

ing section of the state, much of which is devoted to the growing of potatoes. A large area of the soil is the well known sassafras loam which is found in rather large areas in Middlesex, Mercer, Monmouth, Burlington, Camden, Gloucester and Salem Counties.

Potato growers in this vicinity have learned the value of high-grade fertilizers, and many are using as much as a ton per acre. The demand for home-mixed goods has become so great that this firm which began a few years ago by mixing 10 tons, now handles something like 5,000 tons a year in the Cranbury plant and 1000 tons at the Jamesburg plant. The raw materials are purchased in carlots and brought to the plant on a railroad siding which runs along one side of the big building.

Nitrogen is supplied in the form of nitrate of soda, ammonium sulphate, dried blood, and tankage, about half coming from the mineral materials and half from the organic materials. Sixteen per cent acid phosphate supplies the phosphoric acid and the potash is supplied in the form of German muriate. No filler is used, the organic nitrogenous materials being introduced in proper proportions to bring the mixture up to one ton. The exact amount of these materials to be used will vary somewhat depending upon the analysis of the blood and tankage.

The popular formula for potatoes in this section is the 4-8-6 mixture, that is, four per cent ammonia, 8 per cent phosphoric acid, and 6 per cent potash. The writer had the privilege of going thru this plant but did not make inquiry as to the exact proportions in which the raw materials are used to make this mixture.

He would suggest that a 4-8-6 fertilizer could be made by combining the materials mentioned in the table at the foot of this column.

By taking all the nitrogen from nitrate of soda and ammonium sulphate, half and half, it would make a fertilizer having the same analysis as above but requiring a total of only 1610 pounds instead of one ton. For such a mixture there would be required 210 pounds of nitrate of soda, 160 pounds ammonium sulphate, 1000 pounds acid phosphate, and 240 pounds muriate of potash. Such a fertilizer would have practically the same amount of available plant food as is contained in a ton of the other mixture, would be more effective in crop production, would be cheaper than a fertilizer containing organic nitrogenous materials, and would save the handling of 390 pounds of material in every ton. It would, however, have one serious disadvantage. If left standing in bags for some time after being mixed it would tend to become hard and would require more or less pulverizing before it could be put thru the drill. If it could be applied very soon after being prepared it would be an ideal mixture and could be used at a considerable saving over the other mixture. It yet remains for someone to find a cheap material which can be used as a "conditioner" in such a fertilizer so that it will not be necessary for the farmer to pay an

(Continued to Page 24.)

Table Showing Ingredients for a 4-8-6 Mixture

	Raw Materials.	Ammonia.	Phos. Acid.	Potash.
	Lbs.	P. C.	P. C.	P. C.
Nitrate of Soda	85	19
Ammonium Sulphate	65	25
Dried Blood	90	18
Tankage	520	6
Acid Phosphate	1000	..	16	..
Muriate of potash	240	50

One ton of this mixture would contain 79.8 pounds of ammonia, 160 pounds of phosphoric acid, and 120 pounds of potash. Reducing this all to a basis of 100 we would find that we had a mixture containing 3.99 pounds of ammonia, 8 pounds of phosphoric acid, and 6 pounds of potash per 100 pounds, or as it would ordinarily be spoken of, a 4-8-6 mixture.

The tankage would carry considerable slowly available phosphoric acid which has not been included in the above statement.

FARQUHAR

Above is a Farquhar Cornish or "Slab Burner," the economical outfit for driving sawmills. Aneasy steamer, producing dependable power from oil, kerosene and sawdust.

Locomotive Rig below is a general purpose engine, sizes 5 to 60 H. P. Built for service with minimum operating expense and up-keep. For traction power investigate our 50 to 100 H. P. and Gas Tractors. Illustrated booklet "Farquhar Engines and Boilers" sent free to power users. Write today for your copy.

The Farquhar Line includes sawmills, Thrashers, Hydraulic Cider Presses, Potato Diggers, Grain Drills, etc. Full particulars on request.

POULTRY

Useful Colony Houses

THE small portable colony house is an important part of the farm poultry equipment. We find colony houses necessary as brooder houses for the young stock. After the brooders are removed the small houses will protect the young stock until they are sold as broilers, or breeders or placed in the laying houses for the winter. Colony houses can be made to exclude rats and so they are useful as places for setting hens. If there is more corn than the regular storage capacity of the farm can protect, we have found colony houses very useful as corn cribs. By springing enough of the corn is used so the houses are ready to go back to their primary use as brooder houses.

The advantage of the colony house rests mainly on the chance of raising young poultry on clean ground. We find that it is easier to produce healthy poultry when they can range on soil that is not used every year for poultry production. The small colony houses can be moved two or three times during the growing season and each new location will provide an abundance of bugs and green food that possibly had become rather scarce on the old range.

There are three sizes of shed-roof colony houses which are useful. The first is 6 feet wide and 8 feet deep. It can be built on two runners so it can easily be pulled around the farm with one horse. The runners can be made by nailing two planks together. The planks should be each 2 inches wide and 10 feet long and beveled. Two-inch holes can be bored in each end of each runner. These are useful in attaching a rope or chain to pull them around. The frame for the floor will of course fit into these two runners. The door can be at one side of the front and the remaining space devoted to a glass window and an open front space protected with a muslin curtain.

When storms make it necessary to close the window the cloth front will provide plenty of ventilation. Such a house can be built of scrap from other buildings but better results will be obtained from using good grade lumber as the houses have to be moved and must be strong enough so they will not become rickety.

The next larger type we have found of great value for housing coal burning brooder stoves. They are 8 feet deep and 10 feet wide. If not built on skids they can be blocked up on cement blocks to keep out rats and weasels. Such houses are quite warm when covered with roofing paper on the top and on all sides. Strips can be used to hold the paper on. The strips can be painted to give the houses a neater appearance.

The largest type of colony house which we would use is 10 by 12 feet of the shed-roof type. Such a house is useful for brooder stoves and furnishes plenty of roosting space for a good-sized growing flock. But the large colony houses are heavy to move and usually it is hard enough to find time to move houses without the job being any heavier than necessary. Some breeders have placed hubs on the sides of these large houses. Then they have wheels to fit the hubs. The houses are slight-

ly raised and the wheels fastened on and then the house is easily moved on any ordinary soil which is dry enough for a poultry range.

It pays to have colony houses as uniform in construction and appearance as is possible. This adds to the appearance of the poultry farm and must be of some benefit in making sales as the quality of a farmer's breeding stock is sometimes judged by the appearance of the buildings. Of course that is a poor way to judge breeding stock but still the good-looking place has an appeal for customers which should not be disregarded by the owner.

Colony houses can be built during the winter before the rush of farm work. In the spring there is seldom time for such work unless it is done by hired labor. Even an unskilled carpenter can turn out very good-looking colony houses if willing to work slowly according to plans and be careful to build a good square and strong frame. Most of the experiment stations in poultry sections have useful bulletins describing colony houses which have been found practical on their farms. Now that lumber is lower it will pay to look over these bulletins and invest enough to build at least two or three substantial colony houses. If given proper care they will last for an indefinite time and make poultry raising easier and more profitable.—R. G. Kirby.

HENS NEED PROTEIN

I have about forty-five hens of different breeds which I have been giving the best of care but which do not lay as they should. Some of them are of the 1920 hatch and are not laying yet. They seem to be healthy and free from lice. The poultry house is near the piggery. Do you think that has anything to do with their not laying?—Mrs. D. M. M., Kent Co. Del.

Pullets hatched in June need about eight months for maturity if they are of the heavy breeds. Leghorns need about six months. Sometimes the late hatched stock take longer to mature than earlier birds because the early hatched chicks enjoy fine growing conditions in the spring and late in the summer the green food is tougher and the bugs and worms more scarce. Possibly your pullets are laying by this time.

Hens need plenty of sour milk or beef scrap in the ration if they lay during the winter. Instead of the bran and poultry powder in the morning keep a dry mash before them in a hopper. It can consist of 50 lbs. wheat bran, 100 lbs. ground oats and 20 lbs. beef scrap. If you do not wish to mix the mash you can buy commercial laying mash which are very satisfactory and economical to use.

In the morning the birds need a scratch grain in deep litter to make them exercise. An easily mixed ration consists of 200 lbs. corn and 100 lbs. wheat. The position of the poultry house near the piggery should not be a serious detriment if other conditions are all right.—R. G. K.

BUTTERMILK for Hogs and Poultry

Experienced feeders know that there is no better feed for growing hogs and poultry than buttermilk. A regular supply, however, has been difficult or impossible to obtain and feeders have had to do without it. A process has now been worked out for putting this valuable feed on the market in a condensed form, called SEMI-SOLID BUTTERMILK. It is simply adding water you get real, genuine buttermilk with all its great feed value.

Semi-Solid Buttermilk. Like fresh buttermilk, it is an appetizer and tonic, or used as a feed, and keeps hogs in prime condition.

The box contains it eagerly and thrive on it. It is a wonderful feed and conditioner as well as a most valuable feed. Readers of this paper interested in getting rapid growth and good healthy stock should feed SEMI-SOLID BUTTERMILK. For free sample and information about Semi-Solid Buttermilk, write to H. Nester & Co., Dept. 3612, No. 3 Chestnut St., Philadelphia, Pa. or Consolidated Products Co., Dept. 3612, Lincoln, Neb.

World's Best Roofing

Reports on the March Freeze

Further Information About Damage Done in Various Counties

PENNSYLVANIA

Luzerne Co., Pa.—Peaches, plums and cherries suffered most from freezing—early varieties of apples to some extent. Cannot give fair estimate for several days but would guess roughly that fruit damage in county amounts to \$200,000. Early cabbage damaged to some extent but not seriously. Wheat froze in many places but think it will grow out fairly well.—H. N. Cobb, Co. Agent.

Adams Co., Pa.—Peaches, practically all killed. Early varieties of apples practically ruined as it looks at present. Later varieties entirely gone in some sections. Some few orchards examined have some hopes for a part crop but no percentage guess can be made. Cherries and plums gone.—Paul Hoffman, Co. Agent.

Delaware Co., Pa.—The loss in this county is as follows: Apples, 100 per cent; peaches, not less than 90 per cent; plums hardly domestic species, negligible; plums, hybrid and imported species, 100 per cent; sour cherries, 95 per cent; sweet cherries, no information. Small fruits so far as I know were not damaged. I was very much surprised to see the extent of injury in apples. An agent for spray machines, who was in York County on Tuesday, reported that late apples there had not been injured, and I do not know what condition ours were in as a result of Monday night's freezing but I do know that practically none of them were alive Wednesday afternoon. It is a question which night did the worst damage. There seems to be no difference in injury between early and late varieties. In the case of peaches, there is some difference. The blossoms killed were completely open will be almost entirely lost. Those that were showing pink are between 10 and 20 per cent alive. If curculio and brown rot do not get the remainder, a man with 10 or 15 acres of orchard may get enough fruit for use of his own family.—D. Watson Atkinson, Co. Agent.

Butler Co., Pa.—All early plums and early cherries killed. All pears and peaches killed where buds had opened. Two early for definite damage estimate. Late blossoming varieties of pears and peaches are likely safe. Heaviest damage occurred on western slopes.—R. C. Wiggins, Co. Agent.

Dauphin Co., Pa.—My investigation in this county has shown that practically all the early fruits have been destroyed by the recent cold weather. This includes peaches, pears, plums, apricots and cherries. Because of the large number of buds on the various trees it is quite likely that some have escaped. Our growers still hope for some relief but feel certain that most all the early fruit has been destroyed. Later reports show apples more seriously damaged than was at first thought.—H. G. Niesley, Co. Agent.

Westmoreland Co., Pa.—My observation of the effect of the recent frost on fruit has been as follows: Early plums, 100 per cent loss; early peaches, 100 per cent loss; early pears, 100 per cent loss; late peaches, 50 per cent loss; early cherries, 100 per cent loss; late cherries, 40 to 50 per cent loss; early apples, 90 per cent loss; fall and winter apples—normal crop.—W. L. Treager, Co. Agent.

Somerset Co., Pa.—Apples, no damage; peaches, 50 per cent damaged; pears, 90 per cent; sweet cherries, 100 per cent; plums, 75 per cent; no damage to sour cherries.—C. C. McDowell, Co. Agent.

Bucks Co., Pa.—I think that the damage is over-estimated for this county. The peaches already in blossom are damaged entirely but those not yet open are O. K. Not 50 per cent are frozen. The cherry and plum crop is damaged more than peaches.—N. E. Garber, Co. Agent.

Clearfield Co., Pa.—According to reports that I have been able to obtain, I find that practically all of the peaches, pears and plums in this county have been killed by the late frost. The apples have not been hurt.—W. C. Sterrett, Co. Agent.

Montgomery Co., Pa.—The peach

and plum crop is almost a total loss due to the late freeze. A number of our largest growers have about concluded that the apple crop is also seriously damaged.—A. K. Rothenberger, Co. Agent.

Susquehanna Co., Pa.—No damage to apples because buds are not far enough advanced. No peaches raised commercially and doubt if even the few on general farms are hurt.—Chas. P. Pague, Co. Agent.

Northumberland Co., Pa.—Estimate of damage in this county: Peaches, \$50,000; plums, \$10,000; cherries, \$10,000; apples, \$20,000.—J. M. Fry, Co. Agent.

Schuylkill Co., Pa.—Early cherries, 80 per cent of buds killed; late cherries, 50 per cent; peaches, 70 per cent; apples, 45 per cent; pears, 55 per cent; plums, 80 per cent.—W. L. Bollinger, Co. Agent.

Clarion Co., Pa.—The recent freeze has done little, if any damage in this county. I have examined some of the plum buds which are coming in blossom and find that the outer petals are delicate color but that the fruit germ is uninjured. I cannot say at the present time what the injury will be from the present cold spell which we are going thru. There is snow on the ground and the ground was frozen last night.—Ernest E. Fish, Co. Agent.

Elber Co., Pa.—The farms I have visited since the late freeze, I have found very little damage caused by it. The early sweet cherries will have a small percentage of buds killed. The grapes, peaches and apples, as far as I can find, have not been hurt at all.—R. H. Engle, Co. Agent.

Washington Co., Pa.—We have not made an extensive examination but fear the damage to our fruit has been very severe. Some varieties of apples over 75 per cent and peach a higher loss than that. I cannot say whether general farm products are damaged. The alfalfa is damaged so as to affect the first crop materially, probably resulting in 25 per cent to 50 per cent yield.—J. M. McKee, Co. Agent.

Carbon Co., Pa.—Damage slight in peaches, pears, apples.—Nicholas M. Rahn, Co. Agent.

Chester Co., Pa.—The damage in Chester County was largely on the peach crop to the extent of about 75 per cent. Wheat had a little setback in the northern part of the county.—Wm. Vandegrift, Co. Agent.

Greene Co., Pa.—Cherries, early, 100 per cent damage; cherries, late, 50 per cent; plums, 75 per cent; pears, 50 per cent; apples, 25 per cent; new seeded clover, 25 per cent; peaches, 75 per cent.—L. F. Engle, Co. Agent.

Blair Co., Pa.—Apples, practically none; peaches, probably 30 to 40 per cent; plums, fully 30 to 40 per cent.—R. B. Dunlap, Co. Agent.

Center Co., Pa.—Apples, little or no damage; peaches, 75 per cent loss; cherries, 75 per cent; plums, 65 per cent. These are merely estimates without a careful survey.—J. N. Robinson, Co. Agent.

Potter Co., Pa.—I would estimate the damage done to the hay crop in the county will be about \$54,000. This is figured on the basis that the yield will be decreased approximately one-half ton to the acre, which would be quite conservative due to the fact that the grass and clover had started to grow and they were very badly frozen back. The damage done to the wheat crop would be very small due to the fact that we have a very small wheat crop in the county. Considerable damage was done to the apple crop but an estimate would be impracticable because the buds have started very little yet.—Bert Straw, Co. Agent.

Mifflin Co., Pa.—Each crop practically a total loss. Plums and cherries total loss. Apples, cannot tell just yet. Wheat and clover frozen but I do not believe there is any permanent damage.—J. C. Thompson, Co. Agent.

Warren Co., Pa.—Wheat doesn't seem to be affected. Clover, will stunt development for a while. Apples, had big crop last year, seemed to be very (Continued to Page 10).

WEAVER PIANOS

WHAT a flood of memories the music of the Weaver brings—what stirring thoughts of days that are past, when, even as now, its soul enriching tones brought joy to youthful hearts.

The name of Weaver is a proud heritage. For over half a century it has been found only on instruments of exquisite tone and mechanical perfection. And, true to traditions, the Weaver master artisans of today guard jealously their heritage.

The name Weaver on a piano means pure, rich, lasting tone, scientific exactness in construction and an artistic finish in workmanship that is beyond compare.

It is these desirable qualities that have made Weaver Pianos preferred by professional musicians and music lovers the world over. It is these same qualities that will endear the Weaver to you as time goes on.

Does it seem an idle thing,
A pleasant word to speak?
The face you wear, the thought you bring,
A heart may heal or break.
—Whittier

Don't Be Side-Track

FARMERS AND OTHERS interested in the establishment of a state fair in Pennsylvania should not be fooled into accepting a compromise by agreeing to a plan to change the bill which would establish a fair into one creating a commission to investigate the subject. The latter would do nothing but spend a few thousand dollars in a useless investigation and at the end of two years we would be not a whit farther on than we are now. Pennsylvania is now 70 years behind her sister states in this matter and we cannot afford to drag along still farther behind because a few people object from selfish reasons.

Watch Your Fires

OWING TO the absence of the usual amount of snow and spring rains fires spread in field and forest with greater ease than common this year. Already, thousands of acres have been burned over this spring, and the favorable conditions will exist for several weeks yet. It is the duty of every one to be extremely careful with even the smallest fire to see that no possible chance for it to spread exists. Almost all fires of this kind start as the result of criminal carelessness on the part of some one. The burning of trash and brush heaps, even in the midst of a field, is a very usual cause of extensive fires. Work of this kind should be done on a still day or when the dead grass is wet so that the fire can be controlled. The need of reforestation is so great and the annual destruction by fire so large that it will be necessary to pass laws to punish carelessness with the same severity as maliciousness is punished unless the waste can be stopped by the exercise of common, patriotic care.

Big Wheat Crop Forecast

THE APRIL estimate of the Department of Agriculture on the 1921 winter wheat crop shows a prospect of 621,000,000 bushels. This is an increase of 44,000,000 bushels over the crop of 1920. The average condition is 91 per cent of normal as against 75.6 per cent last year and 83.6 per cent, the ten-year average. While the estimated crop for this year is still nearly 100,000,000 bushels short of the 1919 crop, it must be remembered that there is an unusually large hold-over from last year on hand, and also the export demand two years ago was abnormal. If

Pennsylvania Farmer

April 16, 1921

the estimated crop comes to maturity, this amount added to the present surplus will make an amount of wheat so much larger than will be needed for home consumption that it is difficult to see how embargoes or high tariffs will greatly benefit the wheat grower. What is much more needed from statesmen is an honest, intelligent effort to help solve international difficulties so that this country can take its proper place in international trade.

Why The Inconsistency?

WHILE PENNSYLVANIA FARMER has never advocated the policy of concerted action to reduce production, chiefly because we believe it to be unsound economically and impossible of operation, yet we have no sympathy with that class of people and papers who cry "unpatriotic" at the people who do advise a reduction of volume. It is generally conceded that individuals or firms are acting rightly and sensibly in closing their factories when they have produced more than the market will absorb. People will tramp the streets, out of work, and hold no grudge against those who close their factories under such circumstances, and the city papers will print news of the closing simply as matter of general interest. But let it be known that a farmer or an organization has proposed that farmers reduce their production because there is more than the market can take and production is being carried on at a loss, and a mighty howl goes up from the city people and the city press. Where is the difference? Why is one more unpatriotic than the other, because he tries to avoid conducting his business at a loss? This inconsistency in sane people can arise from nothing else than an ignorant assumption that it costs nothing to produce food. Where does the fault for this state of ignorance lie? Will city people voluntarily inform themselves, or is it the duty of the farmer organizations to map out a campaign of education which will enlighten consumers on the economics of agriculture?

Price Changes

WHOLESALE price levels now correspond 40 those of March 1917, having dropped 38 1/2 per cent since the peak of last May. It is, however, 67 per cent higher than in 1914. This drop is indicated in government figures which disclosed the fact that recessions have been very uneven, with farm products only 29 per cent higher than in 1913 and building materials 122 per cent. Based on the index number of 100 for 1913 the following table shows the recessions since last May:

	May 1920	Feb. 1921	% Decline from May, 1920
Farm products	244	129	47
Food, etc.	287	150	48
Cloth and clothing	347	198	43
Fuel and lighting	235	218	7
Metals	193	146	24
Building materials	341	222	34
Chemicals and drugs	215	178	17
House furnishings	330	277	16
Miscellaneous	246	180	27
All commodities	272	167	38.5

It is interesting to note that farm operating equipment prices at their peak were only 73 per cent above the 1914 figure, and that during the last few weeks there have been many substantial reductions from that point.

Gratuitous Advice

THE MAGAZINE called "Industry," published at Washington, from which we published an editorial extract a few weeks ago in which an attack was made upon the Farm Bureau movement, has again come out with "An Open Letter to Farmers." The letter is addressed to those who may attend the meetings of the farmers' organizations called to meet in Washington, April 19-21, and proceeds to lecture them upon the menace of farmers' business organizations.

After laying down the two principles: "Progress and prosperity are not for one class at the expense of others," and, "In a democracy no class can be taxed for the benefit of another class," it proceeds to discuss the dangers of the Farm Bureau movement as follows:

"Will you not in the course of your deliberations make it clear that as the representatives of the self-respecting and self-supporting farmers of the nation, you are willing and able to establish and maintain your own organizations for business and commercial purposes—which every thinking man in America acknowledges you have the undoubted and the inalienable right to do—without seeking a paternalistic extension of Government aid and assistance, paid for by the taxpayers of nation, State and county?"

"We are sure that no association of producers should be permitted which will so control the supply as to arbitrarily fix the prices, and that this applies to producers of agricultural commodities as it undoubtedly does to producers of manufactured commodities. Further than this we are assured that the public, which is the Government, will not permit the selfish consumption of such control, and that efforts at such control lead to either one of two serious results, the assumption of the control by a paternalistic government, which is socialism and the end of democracy, or the assumption of control by some individual or commission constituted for this purpose, which is individual or bureaucratic autocracy and equality the end of Democracy."

"The Farm Bureau organization is drawing into its membership the largest number of farmers ever grouped together into a single federation, equalled only by the membership of the National Grange in the days of its greatest development in the late seventies. The danger is a very real one that the effort, if there is such, to defy economic and political laws will wreck not the laws, but the organization itself. When this happens the disappointment and discouragement of its members will set back for another quarter or half century the essential, safe and proper organization of the farmers, which is needed to develop their own interest in harmony with, and not against, the principles of our democracy, and of economic and social truth."

In the first quoted paragraph the writer makes the common mistake that governmental assistance to agriculture is class favoritism. Nothing could be farther from the truth. Every fundamental industry is aided by assistance and information furnished by government bureaus. It is right that they should be for the sake of economy and efficiency and because the fundamental industries touch the life of every citizen.

The second paragraph echoes the far-fetched and fictitious fear that farmers will squeeze consumers unmercifully if they are permitted to effect such modern business organizations as are found in other lines of business. We want to state a note of warning that this kind of propaganda has been spread so assiduously thru magazines and papers the past few months that the passage of some of the bills introduced into the last Congress is now doubtful.

In the last paragraph there is an effort made to create the impression that the Grange movement in the seventies was disastrous. It was, in a measure, but to the enemies of the farmers and good government. Conditions had become so unbearable that the "Granger Movement" became a successful, revolutionary movement to break the chains of monopoly and special privilege.

Pennsylvania Farmer is not here defending the Farm Bureau movement especially, but we have gone at length into this subject because the article referred to and quoted from is but a single example of the nation-wide drive being made to create public sentiment and influence Congress to the end that legislation demanded and needed by farmers may be defeated. It will require the continued co-operative efforts of the Grange, the Farm Bureau Federation, the National Board of Farm Organizations, the Farmers' Union, the Dairymen's Organizations and all others to successfully combat this vigorous and well-planned attack. Farmers must be careful that the much-talked-of emergency tariff measure which it is proposed to pass does not turn out to be "sop."

Our Washington Letter

A number of new developments are promised in the Federal Farm Loan situation in the near future. One proposition which is to be brought before Congress for action, it is believed, would greatly enhance the usefulness of the system, as it would insure the Farm Loan banks a vast reservoir of funds with which to meet the credit needs of the farmers.

The War Risk Bureau people are going to ask for an amendment to the law which will permit them to invest their reserves in Farm Loan bonds. As they have quite a lot of money now available, this would make a market for Farm Loan bonds. The War Risk reserves in ten years, it is estimated, will amount to a billion of dollars, and will absorb fifty per cent of the Farm Loan bonds.

April 16, 1921

A new angle in the farm credit situation is developing some highly interesting information. The Department of Agriculture, Farm Loan Board and the farmer organizations represented at Washington have received many complaints to the effect that farmers in many parts of the United States cannot borrow enough money on their lands to be of any material assistance to them in financing their farming projects.

The Department of Agriculture estimates that in Iowa the average farmer cannot borrow more than 28 per cent of the value of his land on first mortgage from the Federal Land banks. The department estimates that in Oregon, a comparatively new state, the average farmer cannot borrow more than 46 per cent of the value of his land.

This situation grows out of the limitations placed on loans. First by the Farm Loan act itself, which prohibits Federal Land banks from lending more than \$10,000 to single individuals, and second, by a ruling of the Farm Loan Board which further restricts loans to a maximum of \$90 or \$100 an acre, regardless of what value the land may actually have.

All of this has caused a quickening of interest in the second mortgage as a means of increasing the farmers' power to borrow.

Those who are pressing the matter feel that the proper and successful development of second mortgages as an additional instrument of credit will add considerably to the farmers' borrowing power and will result in giving him loans representing a much larger percentage of the value of his land. The bill is being drafted to create banks to handle second mortgages, the banks to deal exclusively in second mortgages.

HARRISBURG LETTER

Agricultural Legislation.—With exception of the bill to require assessors to make certain reports on crops and acreage to the Department of Agriculture the State administration has backed up Secretary of Agriculture Fred Rasmussen's program. The bills for penalizing persons who ignore the potato blight, and war quarantine, for control of bees and their diseases and various other projects have been approved; the pure bred stallion bill is in the hands of the Governor for action, the pure seed bill is on its way and substantial sums will be given to the department for its work and for continuance of institutes and other field work. Secretary Rasmussen has linked up certain activities with State College and is on a fair way to have the farm bureaus in closer co-operation with the State. If only the State Fair project can be adequately financed to start it the program will be in good shape.

Dog Licenses.—The bill for state control of dog licenses, making county treasurers issuing officers on the same basis as in hunter's licenses and providing for the control of dogs and claims, etc., has been presented. The county commissioners' committee is not opposing the plan and the county treasurers, who will get a ten-cent fee, are not getting in the way. The experience of the last few years has shown need of a strong centralized authority and the new bill does not relieve constables, but broadens state power. It is the intention to employ agents and attorneys, but the claim is made the revenue will be ample for that and to meet the claims for sheep and animals and poultry killed by dogs a couple of times over.

The Peak Year.—The manner in which the State Highway Department has started off its road construction contracts and the systematic way in which additional revenue for this purpose is being sought confirm the reports that this was planned to be the banner year in road construction. William C. Sproul is evidently determined his administration will be remembered by road building. Contracts for over \$5,000,000 worth of roads have already been let and more will follow, while the state will not only join in state aid projects, but help counties and townships with expert advice. Extensive resurfacing and oiling operations will also be carried on.

Few Changes.—The policy of the state is not to make any changes in state routes and to add none at all,

if possible. There are dozens of such projects in bill, but there is a limit even to Pennsylvania's millions.—Hamilton, Harrisburg.

NEW YORK LETTER

Potato Spraying Increased.—Plans to greatly increase the number of fields of sprayed potatoes in Onondaga County will be made this spring. Spraying resulted in such increased yields last year that double the number of farmers want to spray this year.

Licensed Drivers.—In 1903 there were 2382 licensed chauffeurs in this state. Now there are 220,000, and the number grows at the rate of 100 or more per day.

Rural School Standards.—Higher standards for teachers and a fairer equalization of rural school taxes were deemed the two great essentials towards school improvement at a recent meeting of persons interested in the rural schools of seven counties of western New York. As the matter is a rural one, the committee of 21, to investigate it, is largely composed of farmers, and is to send questionnaires to farmers to determine their ideas on giving rural children fairer educational opportunities.

Waste Thru Duplication.—A New York city daily paper is investigating the waste that occurs thru Federal duplication of effort. It finds that in 1919 there were 16 cook books published by the government, not that they were all needed, but because one was needed and 16 departments wanted to be the one to fill the need. Over 300 similar duplications have been found, though the survey is not a thoro one. Eleven departments are engaged in regulating foreign commerce; 15 are engaged in education, 10 in public health work; 16 in chemical research; 22 in engineering research; 25 construct or supervise public buildings; 7 have a hand in Alaskan affairs. With Federal Government costs amounting to \$43 per capita there can be no release from taxation until such methods are corrected. Similar conditions are said to exist in the New York state government more or less.

Empire State Applies to be Standardized.—Growers of apples of the Western New York Central Packing House Association have adopted the brand name "Cataract" apples and will standardize the fruit and the containers used and reorganize packing. They expect to ship from 3000 to 5000 cars per season and to have closed to 50 local organizations completely soon. The average local membership is 20 and the average cost of packing houses is \$7000. Fruit will be sold direct from each house under supervision of the parent association.

To Restore Rural Mail Routes.—A drive has been instituted to get the new postal administration to investigate and to restore rural mail routes as they were before war time changes were made. It is believed many routes will be restored. Inspectors are now at work on Madison Co. routes.

Fruit Injury.—State peaches are badly injured, while those of New Jersey, it is said, were 95 per cent damaged, due to the hard frost following Easter. Sour cherries were hit 50 to 90 per cent in this state; pears 50 per cent; Japanese plums badly hurt, while early blossoming apples were hurt 30 to 40 per cent.

NEW JERSEY NEWS

No Daylight Saving.—New Jersey as a state, will not have daylight saving this year. This is definitely settled by the fact that the 1921 Legislature adjourned sine die on Friday, April 8, with the Eldridge bill providing for a change in time still in the hands of the Senate Committee on Labor, Industry and Social Welfare. It was not reported out in the Upper House, and while it is true that the Senate will again be in session in about three weeks from now, no action will be taken on this or any other bill coming before the session. The object of the second assembling of the Senate is for nothing else than to confirm an appointment to the superintendency of the State Constabulary to be sent in by Governor Edwards. The agriculturists of the state will save thousands of dollars by the fact that there will be no change in the time.—Kelly, Trenton.

THE BLISSFIELD TANNERY Blissfield, Michigan
W. G. White Co., Inc.,

Let a Planet Jr. Work for You

Instead of leaning over a hoe, or bending down to sow by hand, walk upright pushing your Planet Jr., which by its scientific construction does your work with a fraction of the labor, and does it better.

The seed-er places garden seed at the proper depth and distance apart, saving seed and insuring a better crop.

The hoes and cultivator teeth cut or uproot the weeds and turn the soil with a speed and thoroughness far superior to ordinary hand tools.

Use a Planet Jr. to save labor and time, and to raise more and better vegetables.

No. 17 Planet Jr. Single Wheel Hoe is the highest type of single wheel hoe made. A hand machine whose light, durable construction enables man, woman or boy to work the garden in the best manner.

No. 25 Planet Jr. Combined Hill and Drill Seeder, Double and Single Wheel Hoe, Cultivator and Plow sows all garden seeds, covers and rolls the row and marks the next one, all at one passage. In cultivating it either straddles the rows or runs between them. A splendid combination for a large garden.

Planet Jr.

A WELL-FED plant resists disease.

Potatoes, Truck Crops, Tobacco, and Sugar Beets are often attacked by diseases that thrive on ill-fed plants.

The effects produced on these crops by Potash hunger have often been mistaken for a new disease.

Fertilizers for these crops should be well balanced and should contain from 7 to 10 per cent. of Potash.

You can get plenty of Potash if you insist on having it.

HORTICULTURE

Care of Plum and Quince Trees

PLUM and quince trees are given little consideration as to pruning, yet these trees should have just as much attention in regards to this work as the other fruits. Neglect of proper trimming, will not only produce inferior fruit, but will gradually diminish the quantity and will shorten the profitable life of the specimen. To be frank, the plum should be taken better care of than the quince. Most growers seem to think the quince can get along without the aid of the pruning shears. Where this prevails, the crop almost always assumes a bush form and the glutted head gives only a scattering few worthless fruits. It is true some plum trees need less trimming than others, but all need to be carefully trimmed.

It will be noticed, some of the Japanese varieties of plums, are spreading growers, that will require a lot of trimming while young to give them the proper shape. Others will grow more or less in a very cramped condition and will need careful cutting and trimming to properly broaden the top. To consider each would be useless, as each tree is a law unto itself. When young, if rightly formed, plum trees will need very little trimming later in their life. Sometimes there are sucker growths which develop. Where these occur, they should be removed promptly, as they take up too much of the strength of the tree. The fruit of the plum grows on spurs that are anywhere from two to four years old, while some fruit, however, is borne on the past season's wood. When pruning, one must be careful so as not to destroy or break off these fruit spurs. Should these growths become too rampant, heading back of the plum will be necessary. This growth does not generally take place among bearing trees.

Forming the Head

The head, in forming plum trees, should be started from three to four feet above the ground. Care should be exercised against the main framework branches making bad crotches, as plum trees will load heavy as they come into full bearing, and there is liable to be a bad splitting of limbs if weak crotches are permitted to form. A few main framework branches should be allowed to develop from the trunk, but these should be stopped when fifteen to twenty inches long, in order to form specimens that are well branched. The same principle for trimming young plum trees as is required in young peach trees, as far as the top is concerned.

Lateral spreading varieties will have to be kept back by cutting the leading shoots to buds pointing inwardly, in order to send the branches up, in preference to straight out. Where the shoots crowd at the top, head back the leading shoots to buds on the outside, in order to produce a spreading at the top. The tree should be kept sufficiently open, so as to facilitate the gathering of the fruit and to allow easy access of the spray mixtures. Pruning cannot be practiced to any extent in thinning the fruit of plums, even if the new

wood is headed back. This does not remove the fruit spurs. Plum trees are apt to overload, and to overcome this, one must thin the fruit. Unless the practice of thinning is carried out, many varieties will die, due to overbearing, besides ruining the trees, due to breaking of the limbs.

The quince, different from the plum, bears its fruit at the terminal of new shoots, which are developed during the current season. It is wisdom on the part of the one pruning to conserve as much of the strong wood as possible of the last season's growth. Where the growth was two feet or more last season, heading back of the leading shoots one-third their length will be necessary. With quince trees the head should be formed from eighteen to twenty inches above the ground, where five or seven main framework branches should be allowed to form about the top of the shortened trunk. These should be sturdy and well placed.

Weak shoots will develop on quince trees and should be cut away at the annual pruning. Where these weak shoots are allowed to develop, the tops become a mass of tangled wood and very little salable fruit is produced. In order to cause the fruit to set on the outside, it is important to keep the internal wood cut out.

The head should be kept open, as the quince tree needs spraying, as do other fruits, and it would be difficult to readily reach all parts of the tree. Only a small amount of annual pruning will be necessary, once the quince tree is properly formed. This generally consists of keeping the weak wood removed and the heading back of the strongest leaders. In order to insure a profitable growth, where suckers are produced, they should be quickly removed, to keep them from interfering. Each branch should stand alone, and in pruning it is well to see that each branch does this by removing all shoots that interfere with each other. The quince is very hardy and trimming can be attended to at any time, but it would be well to choose the mild spring weather for cutting young plum trees.—W. G. Allbee.

FALL BEARING RASPBERRIES

Several of our neighbors have planted everbearing raspberries but rooted out the bushes a year or two later, not considering them worth growing. One had reported a bountiful crop one year but none the next. It was with these rather discouraging accounts in mind that we ordered twenty-five plants of the St. Regis variety two years ago. The plants were set in good soil which was not too moist and given good cultivation the first season. They grew rapidly and bore a few berries but were not of much account the first season. The next year cultivation was continued and all outside shoots pulled out. Considerable pruning was also done. The result was berries all summer and well up until frost. Unlike berries grown by our neighbors, these were of good size and hung in heavy sprays.

The total crop must have been

considerably larger than that of ordinary varieties and we believe that early pruning had something to do with our success. Ordinary raspberries produce the fruit upon canes grown the previous year. The buds are set the fall before fruit ripens, as is the case with most of our temperate zone fruits and berries. In the case of the St. Regis variety, the canes grow in the spring and bear fruit the fall of the same year, in fact some of the current season's canes ripen fruit as early as July.

The problem of getting fruit from the everbearers depends upon getting an abundant growth of wood early in the spring. If this growth continues right thru the summer, there may not be much but wood. In moist soils this is apt to happen. The canes should start early in the spring, then they should be judiciously pruned, and the new growth allowed to harden and blossom.

A good way to increase the plantation of this variety is to take up the suckers which will be found coming up all around the old plants. These may be pulled out easily, so the task of keeping the plantation within bounds is not difficult. One season of neglect, however, makes the job well-nigh hopeless.

Pruning has a good deal to do with the bearing habits of the variety. Leave the old wood if early berries are wanted from the St. Regis. Late summer pruning will induce growth that will bear in the fall. Fall bearers need a little fussing with, but really now, isn't a dish of nice raspberries along in October worth fussing for?—C. H. Chesley.

ROOT MAGGOT

I am having trouble with maggots in my early truck. I have had some trouble with onion maggots before but this year my lettuce and even peas are infested. Can you tell me what I can do to rid my ground of this pest.—J. A. V., Cumberland County, N. J.

The maggots which are bothering you are probably the so-called seed-corn maggots which do considerable injury to beans and peas. The fact that you use large amounts of manure probably has much to do with your trouble as manure attracts and protects the adult maggot which is a two-winged fly. The application of carbolic acid emulsion is the only direct method of combating this pest. The emulsion is prepared by dissolving one pound of hard soap in one-half gallon of boiling water and then adding one pint of crude carbolic acid. This should be thoroughly mixed, preferably by the use of a bucket pump, until a smooth emulsion is formed. This stock solution is then diluted at the rate of one part of the emulsion to fifty parts of water.

The trouble should be lessened by applying the manure as early as possible as the insects seem to be worse when it is applied in the spring. You are no doubt familiar with the use of tar paper discs for the control of the cabbage maggot. A similar pest attacks onions. The carbolic acid emulsion may be used on the onions and each year's crop should be planted as far from that of the previous year as possible.

Generally speaking, the farmer, and particularly the potato farmer, should utilize clovers, vetches, alfalfa, etc., in so far as it may be practicable. These, by accumulating nitrogen in the soil, will materially reduce the need for using large quantities of nitrogen in commercial fertilizers.

This is an actual photograph taken of the YELLOW JACKET in operation in the Pennsylvania Potato fields.

The Real Secret of Success in Spraying Fruit or Vegetables is HIGH PRESSURE

The under as well as the upper side of the foliage must be thoroughly saturated. Note the dense, penetrating spray produced by our YELLOW JACKET on this field of potatoes, absolutely protecting the crop from bugs, blight and rot and assuring a large, valuable yield.

(Continued From Page 5).

few blossom buds; think these are damaged. I can't feel that the loss was very great in this county.—H. N. Reist, Co. Agent.

Bradford Co., Pa.—The most serious damage will only effect the limited peach crop of this county. Since there are comparatively few extensive orchards of this crop, the damage is hard to forecast. Our altitude is higher than most parts of the state and crops are not as far advanced as in some sections. Consequently, the damage will not be so serious.—D. K. Sloan, Co. Agent.

Fayette Co., Pa.—In some sections the blossoms were out and the thermometer registered 13 degrees. In all possibility these fruits were killed.—Fayette Co. Farm Bureau.

Columbia Co., Pa.—Damage on all fruits very great, probably 60 or 70 per cent frozen in case of peach, apple, pear and plums.—P. G. Niesley, Co. Agent.

Lebanon Co., Pa.—Peaches, 75 to 80 per cent of buds were frozen. Plums and cherries, practically the same as peaches. Apples, 35 per cent of crop lost by freezing. Smokehouse, Stayman Winesap and Duchess were hit very hard. Early Harvest, Yellow Transparent, Grimes Golden, Jonathan and York Imperial are still in good condition.—A. C. Berger, Co. Agent.

NEW YORK

Tompkins Co., N. Y.—The recent damage in this county was confined to the smaller fruits, sweet cherries, peaches, plums, etc. We have but a limited number of small fruit growers. There are, however, a large number that grow their own small fruits and I suspect the amount of loss would run into several thousands of dollars.—V. B. Blatchley, Co. Agent.

Allegany Co., N. Y.—This is not a fruit county, but I believe that fruit is badly damaged. No other injury.—C. B. Raymond, Co. Agent.

Tioga Co., N. Y.—Very little damage was done by frost to the crops in this county. In perhaps a few instances, the buds on apple trees had started enough to endanger them a little but I doubt if the frost has been bad enough in any part of the county to do much damage.—H. B. Fuller, Co. Agent.

Chemung Co., N. Y.—There was practically no damage done to crops in this county excepting small fruits. The buds on the small fruit trees were frosted. As far as I can find out winter wheat was not hurt.—R. H. Hewitt, Co. Agent.

West Chester Co., N. Y.—Apparently no damage in this county.—J. G. Curtis, Co. Agent.

Broome Co., N. Y.—The setback to clover and alfalfa I would estimate at 7 per cent. The total amount of damage in the county is small on account of the small amount of fruit grown here.—J. F. Eastman, Co. Agent.

Chenango Co., N. Y.—Very little damage was done. Fruit buds were injured but as this is a dairy county little loss was sustained.—C. E. Smith, Co. Agent.

Dutchess Co., N. Y.—Sweet cherries, 100 per cent loss. No other damage.—F. H. Lacy, Co. Agent.

Sullivan Co., N. Y.—Last week's temperature fell 45 degrees within a period of six hours. Due to high elevation which averages about 1800 feet, therefore the county fruit was not severely injured. Much damage was done to plums and peaches. On the average as far as I am able to tell now about a 40 per cent damage occurred.—Co. Agent.

Cortland Co., N. Y.—No damage done here.—M. D. Butler, Co. Agent.

Orange Co., N. Y.—No appreciable damage noticeable at present.—L. D. Greene, Co. Agent.

Delaware Co., N. Y.—As there is very little fruit in this county and no spring crops yet up it would be very difficult to estimate the amount of damage done. It probably would be comparatively small in this county.—E. G. Brougham, Co. Agent.

Steuben Co., N. Y.—To the best of our knowledge the damage done by the late cold spell to various crops in this county was so slight as to be practically negligible. The weather in this vicinity was not severe enough to cause any serious setback to buds, etc.—George H. Branland, Asst. Co. Agent.

NEW JERSEY

Cape May Co., N. J.—All varieties of peach show a 95 to 99 per cent injury. All plums that were in blossom (and that means nearly all) show 95 per cent injury. Pears (Kieffers) are injured 98 per cent. Yellow transparent apples injured 90 to 95 per cent and 12 to 15 trees of various varieties have been examined about the Cape May Court House, Rio Grande and Dias Creek sections of the county and it is a sorrowful sight. I believe 90 per cent of the buds are dead.—J. A. Stackhouse, Co. Agent.

Somerset Co., N. J.—The following is the estimated damage done so far as we are able to ascertain at this time. Apples, 35 per cent loss; peaches, 75 per cent loss; pears, 60 per cent; plums, 95 per cent; sweet cherries, 90 per cent; sour cherries, 50 per cent.—Harry C. Haines, Co. Agent.

Camden Co., N. J.—Peaches, 95 to 100 per cent damaged; apples, 75 to 100 per cent; cherries, 95 to 100 per cent; pears, 95-100 per cent. Early pears, 50 per cent; cabbage, 25 per cent.—Samuel F. Foster, Co. Agent.

Morris Co., N. J.—In the following locality no perceptible injury was noted on fruit trees: Florham Park, Pine Brook, Mt. Freedom, Hanover, Hanover Neck, Mt. Tabor and Dover. In New Vernon, it was reported that cherries and pears were ruined and apples and peaches about 10 per cent. In Pine Brook, while there was no damage to fruit trees, there was injury to lettuce and beets. In Dover, there was injury to vegetables growing in cold frames, due to carelessness on the part of the farmer. On the whole, therefore I think that we have come out very luckily and I hope that later results will show that little injury was done.—Berten E. Elv, Co. Agent.

Middlesex Co., N. J.—The fruit crop is of course, the principal one which was injured. The amount of injury I should estimate about as follows: Peaches, 92 per cent; cherries and plums, 90 per cent; apples, 50 to 75 per cent of the buds killed.—Orin G. Bowen, Co. Agent.

Sussex Co., N. J.—From what I can learn by examining peach, plum and apple trees, I should say that the damage to the buds on the first two was about 25 per cent and on the apple trees very little damage has been done by the late freeze. Other crops were not hurt at all.—F. Leon Brown, Co. Agent.

Warren Co., N. J.—I submit the following percentages of each. Peach, 75 per cent; apple, 50 per cent; plum, 85 per cent and cherry, 90 per cent. These tests were made in the vicinity of Belvidere which is usually a few days earlier than the northern end of the county due to high elevation. Possibly the damage there is not as severe.—W. A. Houston, Co. Agent.

MARYLAND

Queen Anne Co., Md.—One-half of peaches killed; 10 per cent of apples.—O. C. Jones, Co. Agent.

Cecil Co., Md.—I would estimate about fifty per cent of the peaches, pears, cherries and strawberries were killed by the last freeze. I think very few apples were injured, probably 5 per cent.—W. C. Snarr, Co. Agent.

Kent Co., Md.—Peaches, 60 per cent damaged; cherries, 60 per cent; apples, 3 per cent; pears, 25 per cent; wheat, 1 per cent.—H. B. Derrick, Co. Agent.

Allegany Co., Md.—Apples, sap froze thru the two barks. Estimated damage to apples—Baldwin, 75 to 90 per cent; York, 70 to 85 per cent; Grimes, 80 to 90 per cent; Jonathan, 70 to 85 per cent; Stayman, 70 to 85 per cent; Romes, 45 to 50 per cent. Peaches, pears and cherries about 85 to 95 per cent.—R. F. McHenry, Co. Agent.

Talbot Co., Md.—We have a number of waterfront farms, on these very little damage appears to have been done by the late cold spell to peaches and apples. Inland farms, where fruit is grown, show almost 100 per cent damage to peaches. Apples, the damage varies greatly with varieties. Wheat shows apparently little injury.—E. P. Walls, County Agent.

SPRAY

Thorough springtime spraying rids trees of fungous troubles and rewards you with smooth, satin-finish fruit. Make sure your spray materials are efficient.

Atomic Sulphur

has proven to be a most dependable remedy for scab and brown rot of the peach and for Apple Scab, Cedar Rust and other fungous troubles on apples. It is a timely spray to use right now.

Free Spraying Service

We advise, direct and co-operate with fruit growers in all spraying matters. Write us plainly about your spraying problems. Our Service Department answers inquiries personally. Your name on our mailing list brings you our Bulletin issued seasonably with timely spraying information. Address

Raising Farm Horses

By W. H. TOMHAVE

ACCORDING to a recent statement issued by the Horse Association of America less than one-fourth of the horses used in Pennsylvania and East are produced upon the farms of these states. Most of the horses used in this section are raised upon the farms of the Middle West and shipped to eastern markets during the winter and spring to meet the requirements of the Eastern farmers. This practice means a good market for the western horse producers with no marked advantage for the eastern farmer. This method of securing horses is expensive for the farmers of the East and they do not secure the kind of horses that should be found upon more eastern farms.

The breeding of farm horses thru-out the East has been at a low ebb during the past few years. This has in part been due to the high price of feed that has prevailed and also due to the lack of interest in horse production brought about by the scarcity of help and the thought by many that power machinery would take the place of horse power to a very large extent. These conditions are changing and the people are beginning to appreciate the value of horses as a source of farm power and the importance of good horses. Some of the work upon the farms and in cities can be done with machine power to better advantage than with horses. The great bulk of the work upon eastern farms will always be done with horses and there is a certain type of hauling in cities that can be handled to better advantage with horses than with truck. Horses have not declined in price during the past year to the same extent as other classes of farm animals and are finding a ready sale this spring. The horses may be selling somewhat lower on the central markets but the eastern farmer has not had the advantage of such decline due to the increased cost of transportation. There is little possibility that the price of horses will decline very much during the next few years on account of the lack of interest in horse breeding by the farmers of the country. There are not enough good young horses in the country to meet the demand from all sections during the next few years.

The farmers of the East can develop a very satisfactory source of additional income from their farms by greater interest in horse breeding. Nearly every farmer is in a position to raise a few colts and develop them each year. The amount of feed necessary and the cost in connection with growing colts is less than the figure at which horses can be sold when mature. The raising of colts does not interfere with the use of the mares on the farm but the additional returns from the horse stock reduces the cost of horse labor. The market demands a heavy draft horse and not small farm chunks. Any horse breeding that is undertaken should be with the aim of producing heavy horses that will weigh 1500 pounds or more when matured. Such horses can always be sold to good advantage when offered for sale

HORSES IN PENNSYLVANIA

While the advent of the automobile and motor truck has practically driven the horse into the discard in the cities and larger towns of Pennsylvania, Old Dobbin is holding his own remarkably well in the rural sections, against the onslaughts of modern inventive genius.

More than half a million horses are still employed on the farms of Pennsylvania, while during 1920 the number decreased only 15,000, a decline of 3 per cent. On January 1, 1921, there were 539,957 horses on the farms of the state representing a total value of \$55,141,507 as compared with 554,019 horses on January 1, 1920.

The average farm horse on the first of the present year was worth \$102.

ALFALFA BEST HOG FORAGE

Repeated tests at various agricultural experiment stations show that alfalfa is the leading forage crop for hogs. The results of demonstrations in Pennsylvania last season are in accord with those findings. Of the eight demonstrations having the lowest forage cost per hundred pounds gain, six of them used alfalfa as forage for the pigs. Farmers co-operated with county agents and State College in operating these demonstrations.

Must be silos pay. Only one-third of the farms in New York State have them, but two-thirds of the cows of the state are kept on these farms.

SHELDON MIXED CONCRETE FOR BETTER BUILDINGS

RETAIL PRICE \$1.25

Read This Advertisement Through THEN MAIL THE COUPON

Here it is—just the book on concreting you've been wanting. Tells how to make forms, how to mix and place concrete, how to reinforce it, what mixtures to use, how to prevent failures, how to do concreting in cold weather. It treats of the construction of walls, foundations, walks, floors, tanks, platforms, etc., giving diagrams and plans. With Sheldon's new book on Farm Concreting to give you the "Know How" and a Sheldon Mixer to do the hard, tedious, back-breaking end of the job, concreting is easy. Start your concreting work right. Start now. Get this Free Book.

SHELDON CONCRETE MIXERS

"Take the Backache Out of Concrete." The Sheldon will solve your labor worries. It will pay for itself on your first small job. It makes farm concreting easy and profitable. It makes possible those many essential, permanent concrete improvements that shut out the rats, save your grain, protect your stock, lighten your work, make the farm a more comfortable place to live on and add value to your property. With a Sheldon you can do your concreting in idle time, when roads are bad and fields muddy.

Do Your Own Concreting and Save Money

Build your own concrete tanks, silos, foundations, barns, sheds, granaries, troughs, walks, platforms, etc. It's easy the modern Sheldon way with the Sheldon Concrete Book to help you. With a Sheldon on the job you can save money on all your farm concreting. The Sheldon is the original, pioneer batch-type mixer for farm use. It is backed by a record of 8 years proven service and over 14,000 satisfied owners. Sold on liberal 30-day Trial with Money Back Guarantee.

Built Right—Priced Right—Sold Right

The Sheldon is light, compact, strong and durable. Easy to move about on the job—will go in a wagon. Mixes a batch in a minute, three cubic feet to a batch. Mixer parts cost only \$14.20. Complete mixers only \$29.55. No conditions, no obligations, absolutely Free. Just mail the coupon.

DAIRY

Raising Dairy Calves
By MELVILLE WETTACH

Some Common Calf Diseases (Concluded from Last Week).

Scours are the result of indigestion, and usually shown by the undigested milk giving the feces a whitish appearance in the advanced stage. There are numerous causes of scours, such as over-feeding, feeding too much oil meal, feed too rich milk or cold milk, dirty feeding utensils, colds and numerous other causes, usually based on improper feeding. At the first sign of scouring, cut their feed and if the cause is known, remove it. If the calf needs all the milk it is getting, add four drops of formalin for each quart of liquid feed it receives and make no cut in the amount of feed. Do this for a few days and the scouring will usually stop. A whole egg in the milk also helps besides being nutritious. For those calves which have their feed cut, give four table-spoons of castor oil. Castor oil is a general treatment for most internal disorders. It may be fed in the milk.

White scours are caused by bacteria which are present when the calf is born and prevention is the best remedy. It affects the navel of the calf and may not be noticeable until the calf is a week old. By that time it is usually fatal. It usually occurs in the winter on large dairy farms where the cows have to calve in dirty stalls where the disease is already present. There is much less danger from it in the summer when the cows can calve in the pasture. To prevent white scours, the pens should be thoroughly disinfected, well bedded and the navel of the calf disinfected with iodine as soon as it is born. If a fatality from white scours has occurred, the stall should be cleaned out, disinfected and well bedded. It should not be used again that year.

Contagious Ophthalmia or sore eye may come from a cold, producing a running eye, or it may be the result of an injury. The pupil of the eye first becomes cloudy and then white. In severe cases all colors may be present and the blindness may become permanent. Isolate all cases and wash the eye often with a solution of one dram boric acid to four ounces of boiling water. Apply as an eye wash when cool.

Lice are of two kinds, red and blue. The red lice are not of importance but the blue ones do the damage. They sap the vitality of the calves causing a loss of weight, weakness and lower the calves' resistance to disease. A sure remedy for lice is to rub the affected parts with a dip made by mixing together three table-spoons of creolin and a gallon of water. Many dairymen use coal oil with good results. There are also many commercial lice killers which are effective. Whatever treatment is used, however, in this case, should be repeated in ten days to catch the new hatch. Before going into winter quarters the calves should be thoroughly gone over for lice. During the winter it is good to wash them frequently with the dip to make sure the lice do not get a start.

There is no danger from colds if the calves are rubbed dry afterwards due to the warming effects of the dip. The pens should also be disinfected during the winter with a solution of creolin to prevent the lice getting a start. This is the best way to keep a healthy, growing herd of young stock.

Colds lead to pneumonia and this results in death if the proper precautions are not taken and the necessary treatment administered in time. Colds are the results of leaving calves out in cold, chilling rains with no protection, housing in drafty, damp quarters, and usually start with some indigestion. The indications are, a hot, dry, or running nose, dull eye and sleepy disposition, loss of appetite, skin eruptions, swollen jaw or scouring. At the first signs the feed should be reduced until the calf recovers. Give the calf four table-spoons of castor oil. Isolate any cases. To prevent colds and pneumonia, the calves must have the proper conditions, especially as to quarters and protection from cold rains. Keep their vitality up by getting rid of the lice and they will be able to better resist sickness.

Summary

1—Calf raising is of greatest importance to the dairy farmer owing to the scarcity of good cows.

2—By raising his own calves, the farmer increases the production of his herd and prevents the introduction of disease into his herd from outside sources.

3—Over-feeding is the source of a large amount of the trouble in calf raising. The calves should be fed more according to their individual size and capacity rather than age.

4—Give the calves all the grain that they will clean up and provide the necessary supplements.

5—A good herdsman watches both ends of the calf.

6—Provide clean, light, well ventilated, dry and draft-proof quarters. Cold never hurts a calf, providing it is dry.

7—Supply the opportunity for plenty of exercise.

8—Every sickness is a set-back. Keep the calves growing and use prevention rather than cure.

9—Indigestion and scours are usually the results of improper feeding.

10—Lice sap the calf's vitality and lessen its power of resisting disease. Be sure that the lice are kept down.

11—Success in calf raising depends on the caretaker.

SPRING DAIRY ITEMS

There is nothing like warm sunshine to disinfect the dairy barn and the bull pen. After the spring springing, allow as much sunshine as possible to reach the stalls and help in cleaning them up for spring. There is not enough commercial disinfectant used in some barns to help out the sunshine. These solutions are cheap to make but they help prevent disease and make the dairy barn a better place for cows to live and men to work.

De Laval

first gave us a better way of separating cream and now a better way of milking

Proof that the De Laval Milker is actually a better way of milking comes from De Laval users from all sections of the country. They are practically unanimous in their agreement that the De Laval increases the production of milk even over good hand milking. The saving in time and the increase in production of milk will soon pay for a De Laval Milker.

Send for catalog, which contains complete information
THE DE LAVAL SEPARATOR COMPANY
NEW YORK CHICAGO SAN FRANCISCO
165 Broadway 29 E. Madison St. 61 Beale St.

Sooner or later you will use a De Laval Milker or Cream Separator

Beginners with dairy cattle are often confused as to whether they have boarder cows or not. Often they expect too much from their cows even when the care is not of the best. There is a type of cow which comes between the boarder and the very high producer. I would call it the useful cow. It doesn't make much money for its owner but doesn't lose any. It is the type of cow generally found on the farm. I believe we should all have useful cows and then strive to make them more useful through good feeding methods and also make their progeny more useful by breeding bulls of the best quality.

When purebred cows are low in price it is a good time to get a start. There is less risk in buying purebreds when their cost is not far beyond their value for beef. It is also less risky to sell the grades and buy purebreds when the additional capital needed is so small. Right now purebreds are low in price and so a lot of farmers who have wanted them will decide that the purebred business doesn't pay. In a few years when every one seems to want purebred cows, some farmers will wish they had started now. Those who start now will be supplying their surplus stock to other breeders when prices come back near normal.

It is the general opinion that the auction sales with their high prices have driven farmers out of buying. But this does not mean that there will not be a fair sale for purebreds at a profitable price in the future. Every cent over the meat value of an animal is worth considering. It is not necessary to sell a purebred for many times the value of a grade of the same weight. Even fifty or a hundred dollars is worth considering when selling surplus cows or heifers.

More dairymen seem to be buying the ready mixed feeds to go with the roughage produced at home. In this way they furnish their cows with a balanced ration without buying several ingredients and doing home mixing. The State Experiment Stations seem to know what these mixtures contain and the farmer who is in doubt can find out what he is buying. It saves a little work to use such feeds and guarantees that the cows will obtain appetizing feed to aid in milk production. Farmers using such feeds should not neglect careful accounts. Then the figures will soon teach them which is the most profitable method of feeding.

An auto truck is a great help in hauling live calves to market. Just lead the calf to the back of the truck. The farmer stands on one side of the calf and the hired man on the other. They take hold of hands under the calf and lift. The calf is hoisted on the truck and the gate closed. Several calves can be carried at a load and in a few minutes they have reached the railroad or market. It is much easier than loading them in a crate and joggling along in a wagon.—R. G. K.

Do you know that a quart of gasoline will explode with as much force as 83 pounds of dynamite? And the ordinary stick of dynamite weighs just a half a pound! Makes one think of "Safety First."

Uncle Ab says it's all right to be a pessimist about yourself, if you will only be an optimist about your neighbors.

The reduced prices quoted above, prove that we are doing our part to help bring conditions back to normal. We forgot profits for the time being. Even cost of materials and labor were ignored when we announced these new prices recently.

In other words—we put ourselves in the farmer's place. We saw that with the farmer forced to accept less money for his products without regard to his costs—something should be done to help. So we cut "Z" Engine prices—and cut deep.

The simple, sturdy "Z" is a better engine particularly adapted for

farm service. Advanced engineering and manufacturing methods, specially designed machines, volume production make possible this rare combination of quality and right price.

That is our part—but farmers themselves everywhere made the combination a continued success by buying over 300,000 of these engines.

Right now, more than ever, the "Z" is needed to help reduce farming costs. And over 6,000 dealers—one near you—have engines in stock, ready to prove that the "Z" is the farmer's best engine buy.

TALKS WITH THE BOYS

EDITOR'S LETTER

To the Boys:

How many of the readers of this page are interested in stock judging and boys' clubs? How many of you have taken part in stock judging contests in your county? In several of the letters that we have received the clubs have been mentioned but we would like to hear more about the work you are doing.

Last fall after judging contests had been held in several parts of Pennsylvania the winners went to State College with their club leaders where they got some more instruction on judging and then went on to the great livestock exposition at Springfield, Mass., where they took part in contests with boys from many other states. We had the good fortune to be in State College at the time the boys were there and we stayed at the same house with some of them. They were a fine, wide-awake bunch and it was a pleasure to talk with them. It was a wonderful trip for the most of them and you may be sure they all were glad that they had gone into the club work with all their might. One of the boys told me that he had never ridden on a railway train until that day on the way to State College.

The fine part of it all was that every one of the boys lived on a farm and of course worked there. No doubt when the sun was hot and the work hard some of them sometimes thought that farming was a pretty poor occupation to take up, but I am sure that none of them thought that way while they were on their trip when they had a chance to see the immense importance of farming and to get new ideas to take home.

Perhaps some of you who are reading this were among those who went to Springfield and I hope that a great many of you will have the opportunity to make the trip some time in the future. If there is no boys' club in your community and no judging contests have your father talk to the county agent about it.

When you do get into the judging contests of course you will try hard to win but you must remember that everyone cannot get the first prize. You can be pretty sure that you will get it if you try hard enough and keep at it, but when you do lose be a good loser. Do you know that some of the most admired of college football teams in the country are noted no more for their great victories than for the sportsmanlike way in which they take defeat? They fight hard but when the whistle blows and the game is over and they realize that they have lost they don't get sour at themselves and the world in general. They are proud of themselves because they know that they have done their best and that it took a good team to beat them.

Let's hear more from the boys in the clubs and contests and from those who are good losers as well as from the winners.

*Sincerely,
The Editor*

BOYS' LETTERS

Dear Editor—I am fourteen years old and live on a farm of fifty acres. We have two horses, six head of cat-

tle and about 250 White Leghorn chickens. I have five rabbits. I like trapping but furs did not bring a very good price this year. I help father to do all the farm work. Our school is about a mile from my home and I am in the seventh grade.—August Boehner, Sullivan Co., N. Y.

Dear Editor—I am eleven years old and we live on a farm of fifty acres. I have three sisters and two brothers.

We have four head of cattle, three big horses, seven pigs and a lot of chickens. I always help Papa to hunt the eggs. I have a Belgian hare which I can catch when it runs from me. Last summer I raised seven little hares.

I go to school, which is about a mile and a half from our farm. I received little cards for not being absent from school.—Colt E. Eisenhart, Adams Co., Pa.

Dear Editor—I was eleven years old on Easter. I have one sister older and a brother and sister younger than I am. We have five cows, three horses, chickens, geese and ducks. I like to hunt the duck and goose eggs.

I can hardly wait until I get the Pennsylvania Farmer so that I may read the Boys' Page and look at the Picture Page.

Our school stopped April 4. I saw only one letter in this Page from Lancaster County and hope this one will get in.—Samuel H. Barnes, Lancaster Co., Pa.

Dear Editor—I am eleven years old and live on a farm of 28 acres. I am in the fifth and sixth grade in school. We keep four cows and two horses and one of them is a colt.

I have a heifer named "Goldy," one year old and is due to freshen the ninth of July.—E. Trumble, Cortland Co., N. Y.

Dear Editor—I live on a farm of 128 acres about one mile from North Brook, Pa. We have two pairs of young squabs, three horses, thirty chickens, and three cows which I milk every night and morning.

I saw some articles in your paper about bird houses and would like to have some information about making houses for the raising of pigeons.

I am in the seventh grade and am twelve years old. I like to trap and hunt and last winter I got a new Winchester rifle and shot an opossum and a rabbit.

We have a garage in the rear of our house in which we keep our car. We also have electric lights and running water which are a great help.—Wm. J. Fryer, Chester Co., Penna.

Dear Editor—I am twelve years old and live on a farm of 130 acres. I live one mile from our school and am in the fifth grade. I have three brothers older and one sister younger than I am.

We have ten cows, four horses and a colt eight months old which is quite a pet. I also have a pup which is all white with the exception of one spot which is black, so I call him "Spot." I am going to train him to help me to get the cows which is my job in summer.—Harry Mann, Bradford Co., Pa.

Of Interest to Farm Women and Girls

Beautifying the Home Grounds

THE writer of this article has made flowers a study for over twenty-five years until they have become an actual hobby, and a pleasing, satisfying hobby at that. But owing to circumstances causing a change of residence a few months ago, the old home and most of the flowers were left behind.

The new home was found to be barren of flowers and shrubs, but plentifully supplied with trees and fruit which are a good beginning toward attractive surroundings.

No home grounds are complete without some evergreens as they are alike beautiful in winter and summer; in winter they supply the only green in the landscape and in summer form a splendid contrast with that of deciduous trees and shrubs. They can be safely planted either in spring or early autumn.

Few people realize how much their home surroundings can be beautified by planting some shrubs and perennials, and a few dwarf evergreens, something that will be lovely, not only in the blooming season, but at all times and will increase in beauty as the years go by, with but little care and money expended.

If a nice smooth expanse of lawn is left in front of the house, it looks much better than it would if flower beds and shrubs were dotted over it here and there promiscuously. There should be a planting of suitable shrubs near the base of the house to conceal the foundations and give it a more home-like setting. If doubtful about this, compare the bare unsightly houses that show the entire foundation, with a house that is surrounded with shrubs and evergreens, and note the difference.

Then plan to have trees and shrubs at the back and sides of the house. Some good fruit trees such as pears, cherries and plums not only look beautiful in a back yard, but they add to the comfort of the family and save the pocketbook as well, when fruiting season comes. Try to have one, or more, good shade trees near the front of the house, one placed near the corner looks more attractive generally than when placed directly in front center.

By looking over the floral catalogues one can choose shrubs for the shady border as well as for the sunny one.

The writer is already planning one for the front of the new home this year where it will be real shady, as the house fronts to the north with two large shade trees about fifteen feet from the front porch. Some forethought is needed to cope with such a situation, but an order has already been sent to a nursery firm for some rhododendrons, azaleas, two Norway spruces, also a Japan cypress tree. The rhododendrons and azaleas will not only be evergreen, therefore beautiful twelve months in the year, but they also bear lovely flowers in the spring, some of them very fragrant. These will be placed near the base of the house. Directly in front of them will be a row of some of the old-fashioned foxgloves (Digitalis) with their lovely, pendulous bells of various colors; campanulas pink, white and blue, a clump of

globe flowers (Trollius) and some myosotis. The latter may be used as an edging as it is low growing, and if the blossoms are cut off as soon as they fade, the blooming season may be prolonged indefinitely. In this way flowers can be had in the shade.

There will be a nice bed of perennial phlox (each clump a different color) in one of the borders at the side of the house; also a few plants of Delphinium, blue, white and yellow, as a florist has been found that has the yellow delphinium which has been unknown to the writer heretofore; also some geums, spirea, astilbe and some hardy candytuft and sweet alyssum will be added, thus making a fine border that will furnish blossoms year after year without an annual planting.

As it is so hard to care for annuals each year, we have only planned to have a few this year, some asters, zinnias and scarlet sage (salvia) and with my window boxes well filled with geraniums, coleas, and wandering Jew vine, the home will be supplied with sufficient flowers and greenery to make an attractive appearance, and still not cause the mistress of the home to be worn out caring for them, as a man will be engaged to put the beds in shape and plant the trees, shrubs and perennials.—E. M. L. B., Susquehanna Co., Pa.

KEEPING LITTLE FOLKS BUSY

Nothing goes farther toward keeping a happy contented flock of little folks ranging from about 6 years to 10 or 12, than a generous supply of wax crayons, plenty of drawing and tracing paper, and a few good pictures for copying. All the materials are cheap and all children are delighted with them—at least I never saw one that was not. Besides being highly entertaining, they are instructive and they furnish unlimited opportunity to cultivate good taste. One is often greatly surprised at the excellent judgement displayed by quite small children in making attractive and harmonious selections. It doesn't take long either for them to learn what is appropriate for the various articles they may wish to decorate. Don't be discouraged if the little tots do make scarlet horses and violet cows at first. This afternoon one of my little lads of six made an elaborate lavender bird; did I criticize? Not a bit of it. The work was painstakingly done and the result unusually satisfactory.—E. M. A.

FIXING UP THE DINING ROOM

It is not hard to clean house if you have a new house. But if you have an old house with poor woodwork, uneven floors, and ceilings either too high or too low, and even the rooms of uncertain size, you have a real problem. When I read about the romance of rambling old houses and the wonderful results that can be accomplished by just refurnishing them in simple old-fashioned style, I cannot help but wonder if the writer has priced simple, old-fashioned draperies and furniture, or wrestled

GIRLS LOOK HERE

Priscilla Tams

(Entirely New)
Made from high grade felt (wool mixture) in assorted combination colors. Blue and White or Black and Red.

Every schoolgirl will want a "Priscilla Tam" and always mindful of our girl friends we have purchased a goodly supply.

HOW TO SECURE ONE
Call on a few of your neighbors and friends and secure their subscription to Pennsylvania Farmer for the balance of this year and all of next at \$1.00 or the balance of this year at 50c.

Send us two subscriptions at \$1 each or 3 subscriptions at 50c each and we will send you a "Priscilla Tam" by prepaid post. Please state what color combination you prefer. Reward No. 133.

with crack-filler or plaster that has knack of finding a new place to come off each plastering time. I have seen some of these old houses remodeled, and they are indeed wonderful. So, too, was the cost of remodeling. But it is of the house that is neither nicely old-fashioned nor new-fashioned, that I would speak.

Last year my neighbor set out to improve her dining room in such a house. It was a rather hopeless room except for one thing—it was large and airy. The room is fifteen feet square, and it is such a long way to the ceiling that one seldom tries to look that high. The woodwork was much in need of refinishing, and the windows were narrow and tall, and not old-fashioned enough to be new-fashioned. There is no fireplace or built-in furniture to break the wall spaces.

But my neighbor is ingenious. First, she had the room repapered two-thirds of the way up the walls with plain, heavy, blue paper. From there to the ceiling she used a light blue-gray flowered paper, with a small blinding strip to join them. The ceiling was papered with pearl white paper.

Then the woodwork was given a fresh coat of varnish. The edges of the floor had been finished once, but needed a new coat of paint and varnish. A blue fiber rug was purchased for the center of the floor, and the most used places were covered by blue and white rag rugs, braided or woven. The windows were given new shades, and the curtains were hung so as to come well out each side of the window, which make the windows look wider, and thus make the room look less high and barn-like. The curtains are of plain white scrim, hemstitched, and edged with a narrow crocheted lace that has a final row of blue just the color of the wall paper. The curtains come just below the window sill.

When the room was finished to the last bit of rubbing up the finish of the furniture, I was surprised at the difference. The room that had been such a hodgepodge before and so dreary looking, is now really cozy and restful looking. It sent me home with ideas for doing something with my own rather hopeless dining room. My neighbor's dining room had cost her no more than if she had papered it with a figured paper that would have been out of place and had run the same paper clear up to the ceiling.—Mrs. Chester E. Lee.

DANDELIONS' FOOD VALUE

Because dandelions are thought of as weeds and are so common, many housewives who are seeking ways to vary the diet in the spring fail to think of the sprawly little plants as good food. And some who do use them as "greens" do not realize that there are many other ways in which they may be utilized. Here is a good recipe vouched for by the home economics workers at the New York Agricultural College at Ithaca.

Dandelion Soup.—One cup dandelion pulp, 1 tablespoon butter, 1 tablespoon flour, 1 cup milk, salt and pepper, yolk of hard-boiled egg. Make a white sauce and add to it the dandelion pulp. Just before serving the soup add the yolk of an egg, which has been pressed thru a sieve.

If a child frets and wants something out of regular feeding-hours, offer a drink of cool water. Even a nursing baby needs water occasionally.

PENNSYLVANIA FARMER PATTERNS
Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3531.—Dress and Sack for Child.—The pattern is cut in 4 sizes: 6 mos., 1, 2 and 3 years. A 2-year size will require 2 yards of 36-inch material for the dress, 3/4 yard for the sack, and 1/2 yard for the bonnet for which 1/2 yard of lining is also required. Lawn, batiste, nainsook, linen, crepe, voile, albatross and silk are attractive for the style here portrayed. Pattern, 10 cents.

3532.—Play Suit for Small Child.—The pattern is cut in 4 sizes: 4, 6 and 8 years. A 4-year size will require 2 1/2 yards of 36-inch material. Crash, drill, gingham, pongee, poplin, repp, chambray, lawn, percale, flannelette, serge and crepe may be used for this design. If desired the smock may be closed on the shoulders. Pattern, 10 cents.

3533.—Popular One-piece Dress.—The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. A 4-year size will require 3 yards of 27-inch material. Serge, plaid suiting, gingham, kindergarten cloth, galatea, poplin, pongee, repp and linen are good for this model which makes a very becoming school dress. The sleeve may be in wrist or elbow length. Pattern, 10 cents.

3534.—Charming Dress for Mother's Girl.—The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. A 6-year size will require 1 1/2 yard of 27-inch material for the gulf and 3 yards for the dress. The model may be of one material or of a combination. Silk and serge, velvet and taffeta, linen and gingham are good combinations. The gulf may have short sleeves and the puff on dress sleeve may be omitted. Pattern, 10 cents.

Distinguish between warm and cold colors when choosing wall coverings. No dark room should be made gloomy with grays or deep blues, and bright tans may be distressing on the walls of a sunny room.

Pastry shells made of leftover pie crust and filled with creamed meat or vegetables add a wonderfully festive touch to a Sunday night supper.

In package goods, don't forget that you pay for the carton, but remember that you are paying for cleanliness too.

Progressive farmers make their own fuel and light

THE Colt Carbide Lighting-and-Cooking Plant has given the farmer the means to enjoy city lighting and city cooking conveniences, available in no other form.

This simple machine mixes carbide and water to produce gas which has been declared by Science to be the hottest fuel known for cooking and ironing. It likewise produces light that is a perfect match for sunlight.

Crushed stone and water produce fuel and light

Carbide is often referred to as "crushed stone". That's just what it looks like. And, in itself, it is equally inert and harmless. It can be stored indefinitely with perfect safety.

The simple little Colt machine brings the carbide and water together automatically. An automatic shut-off control takes care of the supply, so that you pay for just what you use.

Here, then, is the ideal fuel and light for you. The Colt plant is easily installed. It requires but nominal attention, asking but little in return for the marvelous service it performs.

Make your place stand out from the surrounding farms. Give it the manifold advantages of a Colt Carbide Lighting-and-Cooking Plant.

Send us your name and address on a postal and we will tell you all about cost and everything else you want to know. Get the facts and let them decide for you.

Colt CARBIDE LIGHTING-AND-COOKING PLANTS

C-3-21

When cooking is easiest

With a turn of the Beechwood Drafts you get the oven hot for a batch of baking or heat the top for frying and stewing. And, you can as easily heat both parts of a Beechwood Range equally.

Beechwood

Meals need never be spoiled by too quick or too slow a fire when they're Beechwood cooked. You get the heat exactly how and where you want it. Beechwood Enameled Ranges need no blacking. A few rubs with a cloth cleans them. Three colors, blue, brown, and gray.

Markets

PHILADELPHIA PRODUCE

Phila., April 11, 1921.

The market on old potatoes continues slow and dull, and while some potatoes are being sold up to \$1.10-1.15 per cwt. most of the Penna. potatoes are being sold around \$1 per cwt. and some as low as 75¢ per cwt. One car of New York state potatoes in 150-lb. sacks sold here this morning at \$1.85 sack. There is no change in the price on the nearby 3/4-bushels, handled in by the nearby farmers which are selling at 50¢-50c per bushel, mostly around 40¢. The season on new potatoes is now well under way. No. 1 new potatoes sold here this morning at \$8.00 bushel, with No. 2s at mostly \$6 with some at \$5.50 bushel. Southern sweet potatoes are lower at \$1.60-1.75 bushel, on primes with No. 2s at 80¢-85¢. Nearby New Jersey sweet potatoes are firmer on No. 1s which sell at \$1.00-1.05 per bushel, on fancy with poorer at \$1.25-1.35. Mediums are easy at 75¢-80¢ per bushel, and No. 2s are lower at 70¢-75¢ per bushel.

Vegetables—Artichokes are more plentiful and easier at 50¢-60¢ box. Western asparagus sold all the way from 30¢ up to 60¢ bunch, with southern from 25 to 50¢. The Maryland which is just starting sold from 40¢-50¢ per bunch, and the New Jersey ranged all the way from 25¢-75¢ per bunch. The cold weather and snow storm of the morning however will not set the New Jersey asparagus back for a short time. Beans are in light supply and firm at \$3.00-3.50 bushel. Green beans are scarce and higher, selling this morning at \$1.50-2.25 bushel. The market is very firm on cabbage which sold this morning at \$2.50-3.00 bushel, while half hampers sold at \$2.75-3.00 bushel. There was a car of old carrots here this morning which sold at \$3.50-4.75 bushel. Fancy nearby carrots are extremely scarce and such as were here bring \$5 per bushel, or better. New carrots sold here this morning at 50¢-60¢ bushel, and sales are being made around \$2.25-2.50 per bushel. There were about 12 cars of cucumbers here this morning and under these cucumbers the market declined so that fancy sold at \$2.50-3.50 bushel and choice at \$1.50-2.50 bushel. Eggplants are very scarce and fancy when here will bring \$5-5.50 per crate, with the poor ones selling lower to condition. One car of Baltimore kale sold at \$1.00-1.25 per bushel. Lettuce is firmer selling at \$1.00-1.50 per bushel, with poor down to \$2.50-3.00 bushel, although an occasional extra fine lot sells up to \$1.75. Old onions are about steady at \$1.00-1.25 per bushel, while new onions are more plentiful and easier at \$1.50-2.50 per bushel on yellow with white, selling up to \$3 per bushel. Peas are lower under heavier supplies and \$3.00-3.50 per bushel. The market is bare of fancy peppers. There were eight cars of Norfolk radishes here today and the poor condition and sales ranged from 75¢ per bushel to \$1.75 per bushel, on red radishes and 50¢-55¢ per bushel on white radishes. Penna. rhubarb was plentiful and sold at 30¢-35¢ per bushel. Romaine lower at \$1.50-2.25 per bushel. Nearly scallions less plentiful and market declined to \$1.00-1.50 per bushel. Tomatoes in light supply and higher at \$3.50-6.50 per bushel, fancy and \$4.00-6.75 per bushel on choice. There were 9 cars of Norfolk spinach here this morning, the best sold at \$2.50 per bushel but some of it was poor and sold at \$1.00-1.75 per bushel. Watercress is in light supply and higher at 30¢-40¢ per bushel. A few Eastern spring beans are still arriving and selling around \$1.65-1.75 per bushel.

Fruit—Apples are in fair supply for the season of the year, there being fourteen fresh cars offered today and some in very poor condition, and the condition of the apples now show a very wide range, prices are accordingly taking an equally wide range. Ben Davis, 20¢-25¢; Golden Wonder, 20¢-25¢; Ben Davis, 20¢-25¢; Greening, 20¢-25¢; Wines, in barrels, \$1.75-2.00; also various other varieties in poor condition, sold at 20¢-25¢. Apples in basket lots, Ben Davis, \$1.25-1.50; Ben Davis, \$1.15-1.35; Greening, 85¢-1.10.

There were four cars of North Carolina Strawberries here this morning, the first of the season having reached here last week. The berries today showed a wide range in condition, some being soft wet and moldy, while some were in good condition. Best today at 30¢-35¢ per quart, while poor and moldy ones sold as low as 10¢-20¢ per quart. Pineapples are a little more plentiful and are selling mostly from \$2.00-2.50 per box, and 25¢-30¢ per fruit from \$1.50-2.50 per box.

Poultry—Since our last week's report the market has eased off somewhat on live poultry, and at this writing the market is running about steady as follows: Fowl's fancy, 30¢-35¢; medium, 30¢-35¢; broiling chickens, 50¢-55¢; young roosters, 25¢-30¢; ducks, 30¢-40¢. Dressed poultry is about steady as follows: Fowls, 30¢-40¢; roosters, 25¢-30¢.

Eggs—The market on eggs opened up the week at prices which showed a marked change from the closing prices of last week, which are as follows: Penna. and other nearby current receipts, 27¢; fancy firsts, 28¢; fancy selected nearby, 30¢-37¢; southern eggs, 25¢-25¢; Western firsts, 20¢-26¢; Western extra firsts, 27¢-27½¢.

LANCASTER PRODUCE

—April 9, 1921.

Eggs sold at 20 cents a dozen at the opening of market this morning but trading was so brisk at this price that late coming light on a gradually ascending scale until at the close the few eggs still on hand at the stalls were being offered at 28 cents. The first of the season was in evidence this morning and sold for five cents a small bunch. County grown asparagus brought from 15 to 25 cents a bunch and watercress from 15 to 25 cents a bunch and five cents a pound. Local farmers are now offering plentiful

Pennsylvania Farmer

April 16, 1921

PITTSBURGH HAY AND GRAIN

—April 9, 1921.

Demand for hay only fair. Receipts seem fully equal to same. Somewhat difficult to place arrivals, only of the better grades. It is necessary to make reductions in order to effect sale of poor stock. Clover and heavy clover mixed hay not wanted. Light mixed hay will sell but alfalfa and prairie hay unsalable.

Straw receipts light with a good demand. Market fair and steady. Oats, car corn and shelled corn are difficult to place, the arrivals being in excess of the demand.

Hay—No. 1 timothy, \$24.50-25.00; stand and timothy, \$23.00-24.00; No. 2 timothy, \$21.00-22.00; No. 3 timothy, \$16.50-18.50; No. 1 light clover mixed, \$21.00-22.00; No. 1 clover mixed, \$20.00-21.00; No. 2 clover mixed, \$14.00-16.00; No. 1 clover, \$20.00-21.00.

Straw—No. 1 oat straw, \$15.00-16.00; No. 2 oat straw, \$12.50-13.50; No. 3 wheat, \$15.50-16.50; No. 2 wheat, \$15.50-16.50; No. 1 rye, \$16.00-17.00; No. 2 rye, \$15.50-16.50; No. 2 white oats, 45¢-45½¢; No. 2 yellow ear corn, 75¢-77¢; No. 2 yellow shelled corn, 69¢-70¢.

Butter—Receipts, 1946 tubs. The usual Saturday quietude prevailed in this market, but prices were steadily maintained under small supplies. Western butter, solid packed creamery, fancy high-scoring goods, 51¢-53¢, the latter for jobbing sales; extras, 50¢; extra firsts, 48¢-49¢; No. 1, 47¢-48¢; No. 2, 46¢-47¢; No. 3, 45¢-46¢; No. 4, 44¢-45¢; No. 5, 43¢-44¢; No. 6, 42¢-43¢; No. 7, 41¢-42¢; No. 8, 40¢-41¢; No. 9, 39¢-40¢; No. 10, 38¢-39¢; No. 11, 37¢-38¢; No. 12, 36¢-37¢; No. 13, 35¢-36¢; No. 14, 34¢-35¢; No. 15, 33¢-34¢; No. 16, 32¢-33¢; No. 17, 31¢-32¢; No. 18, 30¢-31¢; No. 19, 29¢-30¢; No. 20, 28¢-29¢; No. 21, 27¢-28¢; No. 22, 26¢-27¢; No. 23, 25¢-26¢; No. 24, 24¢-25¢; No. 25, 23¢-24¢; No. 26, 22¢-23¢; No. 27, 21¢-22¢; No. 28, 20¢-21¢; No. 29, 19¢-20¢; No. 30, 18¢-19¢; No. 31, 17¢-18¢; No. 32, 16¢-17¢; No. 33, 15¢-16¢; No. 34, 14¢-15¢; No. 35, 13¢-14¢; No. 36, 12¢-13¢; No. 37, 11¢-12¢; No. 38, 10¢-11¢; No. 39, 9¢-10¢; No. 40, 8¢-9¢; No. 41, 7¢-8¢; No. 42, 6¢-7¢; No. 43, 5¢-6¢; No. 44, 4¢-5¢; No. 45, 3¢-4¢; No. 46, 2¢-3¢; No. 47, 1¢-2¢; No. 48, 0¢-1¢; No. 49, 0¢-1¢; No. 50, 0¢-1¢.

Butter—Country, 50¢-55¢ lb.; separator, 55¢-60¢ lb.; milk, 10¢-12¢ lb.; dressed, 12¢-15¢ lb. each.

Vegetables—Potatoes, 50¢-100¢ lb.; 45¢-60¢ lb.; lettuce, 10¢-15¢ lb.; loose, 5¢-10¢ lb.; cabbage (southern), 40¢-50¢ lb.; 30¢-40¢ lb.; onions, 30¢-40¢ lb.; lima beans, 20¢-30¢ lb.; corn, 10¢-15¢ lb.; 15¢-20¢ lb.; 20¢-30¢ lb.; 30¢-40¢ lb.; 40¢-50¢ lb.; 50¢-60¢ lb.; 60¢-70¢ lb.; 70¢-80¢ lb.; 80¢-90¢ lb.; 90¢-100¢ lb.; 100¢-110¢ lb.; 110¢-120¢ lb.; 120¢-130¢ lb.; 130¢-140¢ lb.; 140¢-150¢ lb.; 150¢-160¢ lb.; Standing Stone

An Indian Legend of Northern Pennsylvania

By
ABLETT
LINCOLN
FLURY

ATTRACTED by the cheerful glow of the campfire before the door of the Moravian Mission, Brown Bear wandered toward it. He joined the circle seated around the White-Father-of-the-Chapel who was teaching his converts. Brown Bear did not profess Christianity but came out of simple curiosity to hear the doctrine that had changed the lives of many of his tribesmen. Under the influence of the new gospel many of them forsook the warpath, fighting only to defend themselves when attacked. This peculiar transformation mystified him.

"Love thy neighbor as thyself. Do good to them that ill-treat you. Love even your enemies for they sin against you thru ignorance just as you sin against your Heavenly Father. How often we forget and break His commandments! Yet he shows us with blessings. So we, too, must help with kindness those who would abuse us. Repay evil with good," preached the missionary.

The brave withdrew in disgust. That religion possessed no power. No victory could ever be gained by such gentleness. In his own mind, he was convinced that his enemy, the Medicine Man, needed something quite different to love. Because Brown Bear had accidentally broken a taboo, the Medicine Man had demanded all four of the brave's horses in payment for warding off evil spirits. Brown Bear considered the toll taken excessive, particularly as he recalled the night in the winter when he had rescued the Medicine Man from a hostile band of Indians who were about to carry off that dignitary.

"That," thought the brave, "is a sample of the reward of good deeds." Superstition alone prevented him from engaging in an open attack on the shaman. Revenge could be taken in a less direct way. Brown Bear returned to his tent where he rolled up in his blanket to catch a few hours sleep.

About 2 A. M. he arose and slipped from his tepee. The twinkling stars, high above the clouds in the mackerel sky, gave him just enough light to pick his way. The moon had gone down earlier in the evening. Before him, the majestic Susquehanna, in a serious mood, swept by grandly and smoothly. Slightly ruffling the river's serenity just above the encampment was the entrance of Wyalusing Creek. Brown Bear, however, turned down the river to a place where all the tribe's horses, under a communal custom, were hobbled. Moving with the absolute quiet that only an Indian can achieve, he discovered the sentry sitting with his back against a tree, his head resting forward on his doubled knees.

Gliding stealthily among the horses, the brave separated three of the hobbled animals from the rest. Apparently he had decided beforehand just which horses he wished, for he returned one of the three and selected another to take its place. The hobbled horses traveled slowly but the Indian made no endeavor to hurry them. Even the crickets in the field, undisturbed by his cautious steps, continued their chirping. Anyone, seeing the horses grazing as they traveled, would have inferred that they were only straying in search of fresher pasture.

When he estimated that the horses were far enough from the sentinel not to wake him if they should whinny, he removed the ropes that bound their feet. Using these as halters, he leaped upon one of the horse's backs and led the other two. Several streams that required fording and the mountains, compelled him to travel first away from the river, then toward it, always, however, moving upstream.

Shortly after daybreak, he beheld the village of Towanda in its before-breakfast activity. The smoke of newly kindled fires was visible before several of the tepees where some of the squaws were lighting fires; others were carrying water in earthenware jugs and cooking. Continuing straight into the heart of the village,

These pictures show some of the results of a wind storm that swept thru West Bradford Township, Chester County, Pa., one day last month. It ruined this barn, which, fortunately, was insured. Farther up the valley a village was practically leveled, many people being left destitute.

Brown Bear stopped only when he reached the most ornamented wigwam. Few of the squaws turned their heads to look at him. When he drew up his horse before the tepee a maiden wearing an eagle's feather in her hair looked up at him from the kettle she was stirring. She smiled and was about to take a step toward him, but her Indian stoicism prevailing, she turned again to her task. By the time he had dismounted, Brown Bear beheld the Chief facing him. No greetings were exchanged.

"I have brought the horses I promised," the brave announced. "May you keep your promise as well."

The Chief spoke sharply to the maiden who still leaned over the fire. "Come, Eagle Feather," commanded the Chief. "This is your husband. When the sun is overhead, we will celebrate your wedding. Then you will return with your husband to his tribe."

Brown Bear pointed to the sky.

"A storm is gathering. It is not good that the brave and his bride leave her father's tepee in the rain. Let us have the ceremony now that we may travel down the river and reach our home before the storm breaks," urged the suitor.

The Chief glanced toward the cloud-hidden sky, grunted and shook his head in dissent.

"Manitou gave us the way to marry," declared the Chief. "We must not anger him by using his gift lightly."

Brown Bear realized the necessity of being on his way before his pursuer reached Towanda but he bowed to the Chief's decree. By noon, preparations for the ceremony were complete. In a mock chase, Brown Bear pursued Eagle Feather, captured her and bore her in his arms to her father. The Chief placed his hands upon their heads.

"Brown Bear," he began, "Eagle Feather is your bride. May Manitou mark your trail clearly thru the forests of life. Let us now feast and

Wasting no more time, he began walking around the field in a huge circle until he discovered the tracks of the missing horses. Turning, he raced back to camp, gathered up three cursing stones from his tepee, mounted a horse and galloped away.

Thru the woods and across the open fields he raced. Turning sharply to follow the foot-prints, backtracking several times fooled by the brave's wily scheme, calling down curses, and watching lest he should be ambushed. Early in the afternoon he ascended the mountain crest from which Towanda suddenly came into view. A clap of thunder, followed by a strong blast of wind, made him rein in his horse.

"Manitou is answering my prayers," he muttered.

A small object on the river attracted his attention. Shading his eyes with his hand, he distinguished Brown Bear and Eagle Feather in a canoe.

"Both of them shall die!" swore the Medicine Man.

Lashing his horse to a gallop, he tore down to the river's edge where he leaped from the animal's back to spring into a canoe. He believed his own life charmed; he could not drown. He would, however, have the satisfaction of seeing his victims' destruction.

The thunder claps began to come at short intervals, each report growing louder, echoing and re-echoing among the hills till they merged into one steady roar. The heavy clouds gathered closer and closer to the earth. Night fell in a heavy pall. Sharp flashes of lightning made the darkness seem deeper by contrast. The wind increased in violence.

The Medicine Man ceased paddling. All his exertions were devoted to steering. It was useless. The canoe, with but one person to burden it, was blown ahead with the current. Its speed was greater than he had hoped or anticipated.

"Manitou is with me," he shrieked. His words were hardly heard above the thunder's roar, even by himself.

The bridal canoe, weighted down almost to the water's edge, was less exposed to the wind. Consequently, it traveled only with the speed of the current. For the same reason, more care was necessary lest it should run upon a hidden rock. The Medicine Man's canoe would pass over rocks that might have spelled disaster to Brown Bear and Eagle Feather. A few drops of rain fell, followed in a few seconds by veritable sheets of water. The brave's canoe was in great danger of being swamped. Eagle Feather laid down her paddle so that she might bale out the water with her hands.

Startled by a cry from her husband, she looked up. The current was bearing them into an eddy at the base of a cliff. Ordinarily, it would have presented but little danger. Now, with the river lashed to foam by the wind and with the water pouring into the canoe, the small whirlpool would be sufficient to upset the craft.

There was one chance. Brown Bear might guide the canoe close to the outer edge of the whirlpool and then shoot into the smooth water just under the overhanging cliff. Once there, they would be trapped. But, during the remainder of the storm, would be safe. Nearer and nearer the whirlpool they drew. A dexterous twist of the paddle, requiring all the strength of the brave's powerful muscles, and the danger was past. He guided the canoe to

a favorable position where he could watch the river.

From the overhanging rock poured a torrent of rain. All the water that fell upon the face of the cliff was concentrated into this one stream. The wind caught it and blew it about as it fell thirty feet to the river. The brave and his bride were bathed in the muddy spray.

A shout from the river caused them to look in that direction. The Medicine Man in his canoe was feverishly paddling backwards. In his endeavor to avoid the whirlpool, he had gone too far toward the other shore. He was now caught upon a rock in the shallow water.

He was unable to free himself. Soon the force of the current, combined with the strength of the wind, would tear a hole in the bottom of the canoe. He contemplated leaping from his boat in an endeavor to walk ashore in the waist-deep water. He remembered, though, that the sharp rocks on bottom, inclined at all angles, would give him a very insecure footing. His balance once lost, the current would upset him and prevent him from rising. To swim thru the wind-stirred waves, with the blinding rain pouring upon him would invite death.

Realizing that his efforts were useless, he paused to rest. He caught sight of the bridal couple the instant they discovered him. Upon the face of the cliff the Medicine Man spied a flat, jagged-edged boulder, weighing about a ton. The rain had carried away much of the soil that held it. Here was his opportunity. "Ask Manitou only for the possibility,"

He repeated this maxim which he had learned early in his career. Reaching into the pouch at his belt, he drew forth his most treasured possession. It was a blue stone with three holes bored thru it. Thrice he rubbed it across his forehead, muttering to it. Rolling his eyes until the whites became prominent, he called for the boulder to crash down the cliff; to break the thin shelf that protected the brave and his bride.

So gradually did the rain carry off the supporting soil that the beginning of the huge rock's downward journey was almost imperceptible. Thru the downpour, it seemed as though the driving rain was playing a trick upon the senses.

Slowly the speed increased, as the rock gathered force in its thousand-foot fall. A projecting surface raised one side so that the rock rolled instead of sliding. After that, it fairly bounded like some wild animal over obstructions that might have stopped it when sliding.

The Medicine Man raised the tone of his incantations. He rocked to and fro. His mutterings grew into long protracted cries and walls. Suddenly, he stopped. The emotional frenzy left him. He stared horror-stricken upon the rolling rock. Five, ten, fifteen feet into the air it leaped, rejoicing in its temporary freedom. Its jagged edge, bumping against the unevenness of the slope down which it rolled, tossed it away from the cliff.

It described a huge arc thru the air, curving far out over the river. The Medicine Man yelled as he sprang from his canoe. But too late!

A splash that sent the water of the river upward to fall again mingled with the rain; a crunch as the rock of the river bottom met the falling rock; the location of the Medicine Man and his canoe was marked only by the upright boulder wedged

firmly in the river bottom, known to this day as Standing Stone. He and his boat were buried beneath it forever. Never would the Medicine Man learn the joys of the Happy Hunting Ground. The storm raged for several hours. When it subsided, Brown Bear and Eagle Feather were still afloat.

"We will go to the White-Father-of-the-Chapel," the brave said to his bride as they continued their journey down the river. "I thought hate could win, but now I have seen Manitou punish the Medicine Man with a curse of his own making."

"Let us be married according to the White Father's way for he can teach us love; if we know how to love one another, Manitou's love will shelter us."

To this day, those who travel to Towanda will still see the rock that fell from the cliff, standing edgewise to the Susquehanna's current. And I have told the true story of how it got there.

THE VALUE OF A SMILE

The thing that goes the farthest Toward making life worth while That costs the least and does the most,

Is just a pleasant smile The smile that bubbles from the heart

That loves its fellowman Will drive away the clouds of gloom And coax the sun again It's full of worth and goodness, too, With human kindness blent— It's worth a million dollars And it doesn't cost a cent.

There is no room for sadness Where we see a cheery smile; It always has the same good look— It's never out of style; It nerves us to try again When failure makes us blue; The dimples of encouragement Are good for me and you; It pays a higher interest, For it is merely lent—

It's worth a million dollars And it doesn't cost a cent. A smile comes easily enough. A twinkle of the eye Is natural and does more good Than any long-drawn sigh! It touches on the heart strings Till they quiver blithe and long, And always leaves an echo That is very like a song. So, smile away! Folks understand What by a smile is meant; It's worth a million dollars— And it doesn't cost a cent! —W. B. Nesbit, in Erie Co., N. Y. Farm and Home Bureau News.

DISPOSSESSED

At a ball game between a South Carolina negro team and a visiting team of similar color a negro preacher was acting as umpire. The pitcher had gone rather wild and had permitted all the bases to fill. Another man came to the bat and the nervous pitcher shot one over. "Ball one," yelled the ump. The pitcher tried again. "Ball two!" was the decision. Another effort by the hurler. "Ball three!" said the umpire. The pitcher saw his predicament and made one master effort to save the day.

"Ball four!" yelled the ump, "and the man's out!" "How come, I see out?" inquired the enraged batter.

"Is repelled to put you out, nigger. Don't you see dar's nowhere else to put you?" reasoned the umpire.—Columbia (S. C.) State.

A style and size for every requirement

Since 1832 more than 3 million STEWART Stoves and Ranges have been made and sold.

**Prices Have Been Reduced
Get Your New Range NOW**
and be sure you get this old Reliable Make

You take no chances, you make no mistake when you buy a STEWART Range. For the past 89 years, from Maine to California, they have been famous for GOOD SERVICE, PERFECT BAKING and LONG LIFE. In fact, many, many STEWART Cook Stoves that have been in use for 40 and 50 years are still in service. There are probably some right in your neighborhood. We get lots of letters like these—

Blue Store,
Columbia Co., N. Y.
"The date on our STEWART stove is 1839. It was originally the property of my wife's grandmother. She had it from the time it was made. I have used for the past 34 years. Condition is good; it's slightly warped now. There have been no repairs required with the exception of about 20 years ago I purchased some coal fixings. My wife says it is a good baker."
(Signed) GEORGE W. SMITH.

Jamestown, N. Y.
"I have a STEWART range that I am using every day and it looks as nicely as any up-to-date range would. It has been in our family for 57 years and was patented Jan. 18, 1839; it has been in use every day all those years. If it ever wears out I shall buy a STEWART range."
(Signed) MRS. M. A. GIFFORD.

89 YEARS of successful stove-making experience is built into every STEWART Range—that's a mighty good guarantee that they are RIGHT in every respect—design, materials, construction, and finish. They include every modern improvement, and are built to last a lifetime.

STEWART Ranges are sold by leading Hardware, Furniture and Stove Stores in most every city and town in New York; New England, New Jersey and Pennsylvania. If you have any trouble finding one of them, please write us.

A HAND-MIXING FERTILIZER PLANT

(Continued From Page Three).

excessively high price for slowly available organic, nitrogenous materials. This does not mean that the organic nitrogenous materials should not be used in fertilizers; indeed as by-product and waste materials they form a valuable source of nitrogen and should be utilized to the fullest extent possible. However, long-time experiments have abundantly demonstrated that they are not as efficient in crop production, pound for pound of nitrogen, as the mineral nitrogenous materials. Experiments have shown that crops cannot recover as high a percentage of the nitrogen from these organic materials as is recovered from nitrate of soda and sulphate of ammonia. It is therefore, unjust that nitrogen in the organic form should command a higher price than the nitrogen in the readily available nitrate and ammonium compounds. When the organic materials can be sold at a price commensurate with their crop producing power as compared with the readily available mineral materials, then they should be used freely. Until that time the cheaper and more readily available forms of nitrogen should be used where it is possible to do so, without sacrificing the mechanical conditions of the mixture.

Chamberlain & Barclay are meeting a real need in their community. Many farmers want a fertilizer of known composition with reference to the actual materials that go into its makeup, but do not care to be bothered with doing their own mixing. This firm has met the need. Their factory is open to everyone. Farmers can go at any time and see just what is being used and how it is prepared. When they drive up to the plant to load their wagons, they know just what they are getting and know also that it is adapted to their soil and crop conditions.

Acid phosphate is bought in bulk and unloaded by wheelbarrow; other materials are bought in bags. The mixing is all done by hand in ton batches being passed thru large screens as indicated in the photograph. After it has been shoveled over twice it is thrown on the ledges of the pile which serves to further mix it.

At the time the photograph was made, December 7, 1920, there were something like 2,000 tons already mixed, and large quantities of raw materials on hand. Much of this has already been sold.—A. W. Blair.

LABOR FROM HOLLAND

The offer of the Commissioner of Labor and Industry to find Holland farmers for the farmers of Pennsylvania, has caused many farmers to immediately make application for experienced, responsible and reliable tenant farmers, and they are offering special inducements to good men with families. The State employment bureau at Altoona has, at the present time, applications for twelve Holland farmers, from the leading farmers in that district, and in all probability within the next few weeks there will be an increased number of applicants for this class of men. There are now openings for single men on farms as well as a number of untenanted farms in the district.

Milk is a splendid food, and practically a complete food in itself.

True economy calls for efficient machines

International hay machines cut operating costs

WAS there ever a time when to get maximum production with the smallest possible expense was so necessary as now? How are you going to do it? Probably your biggest problem is labor. Labor is hard to get, and expensive when you get it—too expensive to use at keeping worn-out equipment on the job. Efficient machines are cheap. International hay machines are efficient—their long, unbroken record of dependable field service proves their worth.

Therefore you make a true investment when you buy International hay machines. They save labor and time, both of which are especially valuable just now. While you are still busy with the hay, grain harvest

is nearly always at your heels. You wonder how you are going to get your hay out of the way. Do it with efficient machines.

You know your own problems better than anyone else, but, whatever they are, there are machines in the International Harvester line that will put your hay where you want it, the way you want it, in the quickest, most economical way.

A postal request will bring you the International hay machine catalog. It tells all about McCormick and Deering mowers and rakes, International tedders, combined side delivery rakes and tedders, loaders, sweep rakes, stackers and hay presses.

Write for catalog, and see your International Dealer

Gombault's Caustic Balsam

The Standard Remedy
Human and Veterinary

As a veterinary remedy its curative qualities have been acknowledged for many years in cases of Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Spavin, Ringbone and other bony tumors.

A Perfect Antiseptic
Soothing and Healing

For treatment of Rheumatism, Sprains, Neuralgia, Lumbago, Sore Throat, Stiff Joints, Cuts and Bruises it is invaluable. \$1.75 per bottle at druggists, or sent by parcel post on receipt of price. The Lawrence-Williams Co., Cleveland, O.

Stock Raising in WESTERN CANADA

is as profitable as grain growing. Successes as wonderful as those from growing wheat, oats, barley, and flax have been made in raising Horses, Cattle, Sheep and Hogs. Bright, sunny climate, nutritious grasses, good water, enormous fodder crops—these spell success to the farmer and stock raiser. And remember, you can buy on easy terms.

Farm Land at \$15 to \$30 An Acre

—land equal to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—grazing land convenient to good grain farms at proportionately low prices. These lands have every rural convenience: good schools, churches, roads, telephones, etc., close to live towns and good markets.

If you want to get back to the farm, or to farm on a larger scale than is possible under your present conditions, investigate what Western Canada has to offer you.

For illustrated literature with maps and particulars regarding reduced railway rates, location of land, etc., apply to Department of Immigration, Ottawa, Canada, or

Short Cuts With The Corn Crop

Methods Employed in Growing and Harvesting our Most Important Cereal

By C. F. PRESTON

SO MUCH of our farming depends upon the success of the corn crop that each grower will do well at this season to studiously consider those methods which, if adopted on his particular farm, will insure maximum return in keeping with good farm practice. With corn selling at starvation prices—corn that was grown with the highest priced fertilizer, machinery and labor on record, the thoughtful farmer is turning over in his mind the problem for 1921, namely how shall he prevent the cost of production from overtaking if not greatly surpassing the market value of his crop, for every bushel is sold, if not for cash then to animals on the farm and subsequently marketed in the form of livestock or livestock products. Lowering producing costs while not an overly popular theme is none the less our main problem for study.

Farmers have never been able to arbitrarily set prices and probably never will. The inefficient producer would demand a price sufficient to let him out on his enterprise regardless of methods followed and ultimate costs, a situation that would be manifestly unjust to the consuming public. You may say without due thought that producers of other commodities name their sale price and the public pays without question. Yes and no. Just for example let us take the mining of soft coal, a commodity for which there is always a market demand more urgent during the war period than at any other time, but just now a decided reaction has set in, the price has gone down and numerous mines are working on part time or have suspended operations altogether. Continuing let us say that the average price of soft coal at the mines has dropped from \$10 to \$2 per ton. The large operators working the heavier veins with plenty of cars, modern equipment and favorable location with respect to railroads find it possible to continue their output and sell at the new price. The small operator less favorably situated, working a lighter vein of coal and hampered in many respects finds he is unable to continue in business with profit and quits. If he were to attempt holding prices at their wartime level custom would immediately cease. He accepts the former alternative. This is only one example of what is going on in all industries and one class of workers is unfortunate in holding the view that others are able for any length of time thru organization, conniving or other means to establish and maintain prices of any commodity above actual values. And so it is whether the issue be coal or corn the inefficient producer is crowded out; it is simply an exemplification of nature's law of the survival of the fittest.

How then shall we lower unit costs as they affect the production of corn? Few figures are available to show what per cent of the total cost of raising a bushel of corn is represented by man labor exclusively but a hurried calculation convinces the writer that the average bushel of corn raised in his own state of Pennsylvania last year had a charge against it for man labor of not less

Early Cultivation Gives Corn a Good Start

Soy Beans Keep Down the Weeds in Corn and Add Protein

than fifty cents and this constitutes the biggest single item. We are speaking of average costs; not the lowest nor yet the highest. Frankly, man labor or in other words farm help cannot again be so highly paid to raise another big crop of still

lower priced corn in 1921. The farmer himself has been compelled to take heavy losses (the state department of agriculture in Pennsylvania estimates an average loss to the farmers of this state at \$434 for 1920), he has been obliged to work for a greatly reduced income and by the same token those who labor for him must forget about the eight-hour, \$5 per day combination that could be imposed upon the employer for such special jobs as threshing and silo filling just a few short months ago. Costs may be still further reduced by the employment of short cuts in handling the crop. It is the purpose of the writer to show how, thru the adoption of certain methods, the three common practices of replanting, thinning and hand hoeing can be almost if not entirely stricken from the schedule. Crows, wire worms, heart worms and other well-known pests sometimes break up the uniformity of the stand but in the main these are minor points when compared with the failures in stand due to planting seed of unknown viability. The crow problem will not prove serious if one will but keep an appointment with his field during a few critical days and time the appointment at 4 A. M. His equipment will consist of a shotgun and a few shells. This supplemented by a little patrolling at odd hours of the day on the part of children will solve the crow problem. There are farmers who find satisfaction in constructing scare crows, devices which may fool the farmer but rarely if ever the crow. The worm problem is more difficult of solution but injury usually occurs in areas and my observation is that where serious, practically every plant in an area is ruined and drilling corn at the rate of one grain every six inches would not overcome this situation. The real and principal cause of poor stands of corn is poor seed. This is incontestable. It requires a long time for some of us to overcome certain delusions to which we cling with utmost tenacity but the farmer who nowadays asserts that he can tell whether or not corn from ears will grow by simply looking it over gains for himself the unfavorable estimate of his better informed neighbors. To be sure, anyone recognizes a mouldy ear at sight but mould is not the only cause of sterility in seed corn, and the obscure factors are brought to light only thru the germination test.

Too many hold the view that the germination test is merely a fad suitable for a schoolroom exercise in the study of agriculture but the sooner the practice becomes general the sooner will we be able to reduce the now common practices of replanting and thinning and the sooner will expenses go down and yields up. Ask the sawdust (Continued to Page Eight).

Attracting Consumers to the Farm

The Story of a Delaware County Farm's Solution of its Marketing Problem

By WILLIAM J. WATTS

IT IS generally conceded that farm producer and city consumer are too far apart in their common interests. They are standing afar and beckoning to each other while between them lie the barriers of disorganization, speculation, commissions, and costly handling from dealer to dealer. The people of both classes have accepted the condition as one to be suffered except in a few cases where under necessity they have arisen to the occasion, as in Delaware County, Pa., where "Black Horse Farm" is located and where the consumers are awake and have hearkened to the call of the producer.

"Black Horse Farm" is located on the historic Baltimore Pike about fifteen miles southwest of Philadelphia and also at the intersection of another main highway. It is not only in a progressive community but a continual line of touring cars and other conveyances pass the farm daily. The owner had thousands of bushels of apples to sell last fall and was confronted by the usual difficulties and the inadequate prices that are associated with the indirect ways of reaching the consumers. Consequently he placed a sign, "Apples For Sale," at the entrance of the farm drive, advertised in local papers, and most effective of all, convinced every roadside customer at first sight that his apples were the best to be found anywhere. The volume of business carried on would be astounding to anyone who believes roadside marketing is too bothersome or too trifling for the disposal of large quantities of produce. The consumers who benefited were convinced and returned time after time while other farmers saw the revelation of a market at their doors. The direct system of selling was adopted to avoid the difficulties that were partly permanent and partly due to war. Barrels jumped from 35c to \$1.50 or \$1.60 each while labor was almost prohibitive, and transportation was slow and costly, all combining to make an almost impossible price and still no profit to the producer. The plan reduced the handling to two parties, the grower and consumer. By the old method there were four or five operations and an equal number of additions to the final price. It was necessary to cart or truck the produce to the railroad, pay freight, remunerate a commission man, who again sold to a jobber or wholesaler from whose warehouse it must again be hauled to the retailer and again from store to consumer—four or five operations and costs which were in this case reduced to a single sale at the farm. The result was that the grower got about 20 per cent more for his apples than he was offered by the brokers and the consumer paid about half as much as by the other method. For example, apples that sold in the cities and towns for 25c to 30c a quarter peck or about four or five dollars a bushel were sold directly to households for from \$1.50 to \$2 a bushel. Apples that retailed from 75c to \$1 a dozen were sold at from 25 to 40 cents. The most beautiful Stayman Winesap tree ripened apples such as are rarely seen on the markets, due to cold storage stocks, sold at the rate of 40 cents a dozen. These differences explain why the consumers were willing to meet the grower at the farm.

It is practically certain that unless there is a quick change in the methods followed by dealers the farmers and the people they feed will find various efficient ways of getting together either at the farm gate or the city door. The city man who has a car is glad to combine pleasure and profit in his drives to the country if he knows exactly where to find choice fresh fruit, vegetables, eggs, butter, etc. Automobiles and roads are both improving and many a farmer as well as city man has awakened to business opportunities that did not exist a few years ago.

The most common criticism of roadside marketing is in regard to the annoyance to the farmer when he is at other work. If there is sufficient produce to sell, and the way of curing for customers is carefully systematized, this feature can easily be overlooked. At "Black Horse Farm" apples are handled in bushel hampers, all grading having been done at the orchards. The legal measure is at once recognized, no sorting is necessary in the presence and rush of the buyers and

also with lids fastened the same as for shipment or export little time is lost in caring for trade. On this farm apples are the chief item but while they are moving various other products are kept cleaned up. Cider is kept on tap in both kegs and jugs, fancy Leghorn eggs in convenient packages, potatoes also in bushel hampers, and many other products are kept in convenient form to be picked up and placed in a car. Many thousands of bushels of apples passed from the farm entrance in consumer's cars, or other conveyances. The people in charge had no complaint to make about annoyance by customers, and the business proceeded in much the same manner as a city wholesale produce market. The orchards are seventy miles away from the home farm so the fruit was transported on motor trucks in two hundred bushel loads. Six hours after the apples were taken from the orchard they were being picked up by the consumers. The storage rooms were kept in convenient order, different grades and varieties were in plain view and there were all kinds for all classes of buyers. Even a few prize selections were laid aside for the use of artists who want specimens for painting. The whole

In Southern Lancaster County, Where Silos Grow Tall. This One is 70 Feet High

system worked without anything noticeably irksome and no doubt the same plan with gift containers (in this case ten cents were allowed for a returned hamper), could be worked out on many more well located farms. There are today cheap containers and materials suited to the making of them for nearly every food product. Paper bags, cartons for eggs, butter, honey, etc., and crates or baskets of many kinds can be made or bought. Since most of the purchases are carried in passenger automobiles the convenience of the customer is of first importance. Few owners of touring cars relish the sifting of dust from potatoes in crates or open mesh bags, the possibilities connected with eggs in paper bags, or dripping honey packages.

"Black Horse Farm" was once the location of a famously hospitable roadside inn also known as the "Black Horse" but today the name known all thru the vicinity is not only associated with hospitality but a roadside market on a beautiful farm where all the old-time friendliness and solicitude for patrons is carried out so far as possible in helping people to get food at a price that pays for little more than its production. There is something about driving up to a substantial old farmstead, sipping a little cider, warming before a log fire after an exhilarating

drive, and sniffing the air of deliciously scented fruit storage rooms that prompts repetition.

It is a little taste of the farm life that nearly every man craves, and fortunately the best part of it is when the crops are ready for consumption, and we see the customers returning repeatedly. Anyway the outing to the country is enjoyed far more than a trip to a store. The owner of Black Horse Farm was asked why he did not rent a room in Philadelphia and get in the heart of the market and he explained the cost that would be added. There would be rent, cost of staying in town to attend the business, added distance in hauling, the disadvantage of scattered work and various other deterrents. Since it is not much of an inconvenience to most of his customers to reach the farm, many of them travel the road anyway, and since the volume of sale is sufficient there is no reason to contemplate a change of location. Several farmers in the same vicinity but with smaller farms have been heard to say they have sale for all produce at their property. This is an advantageous feature commonly mentioned when a farm is offered for sale.

The inconsistency of delivering farm produce grown just outside of the suburban districts to the center of a big city and dumping it on wholesale markets only to be taken back at great expense almost to where it started is apparent to anyone. If the crops from these nearest farms can be distributed by either producer or consumer or by the co-operative efforts of both the prices can be better suited to each, as demonstrated on Black Horse Farm. A general movement along this line should make the central city markets much more open and able to handle shipments from distant farms where direct methods are impossible.

WHEN YOU PLAN, PLAN BIG

When the War of the Rebellion came to an end, James M. Emerson found his way back home to a small hill farm in our neighborhood. It was then like a good many such farms on the hill; it never had made anybody very rich; but Mr. Emerson had a vision of what it might be made to do.

The way he set out about improving his farm was by keeping stock to the limit. He never had many cows, but he did have horses. He liked horses. He raised colts, and often he had more horses than it seemed as if he could keep, or had any need for. But he knew what he was about, all the same. The surplus he sold for fair prices. The colts had a way of growing up and they, too, made horses that other people wanted and were willing to buy and pay for.

And all the time those horses and cows were turning the hay and grain raised on the farm into more horses and more cows and leaving good-sized heaps of fine fertilizer for use on the place. It went there, too. I do not remember now that Emerson ever sold any hay off the place except what had been transformed into good farm animals.

For some years after we went on the farm we did not keep more than one horse and we changed work with Mr. Emerson to get our haying done. That gave me a chance to see what kind of hay grew on his farm; and I am within the bounds of truth when I say that I never saw such clover and timothy anywhere as he grew on that hill farm.

He had planned big in the beginning, but in one respect he could not foresee what was going to happen to his barn. It was far too small. He made it larger. I think he made two additions to the building and every time folks wondered what he was going to put in it. They found out after the crops were in, for the barn was crowded to the peak.

Planning usually comes out where we want it to, if we plan big, farms and barns are apt to be big accordingly.—E. L. V., New York.

The shortest way to do many things is to do only one thing at a time.—Cecil.

Experiment Stations as an Investment

Their Usefulness Increases as Agriculture Becomes More Complicated

By J. G. LIPMAN

Director N. J. Experiment Station

ANY opinions to the contrary notwithstanding, agriculture as an industry has moved forward at an amazing pace. The progress of the last fifty years has been speeded up, no doubt, by contributions which science has made in many directions. But even before science came to play a part in the advancement of the business of farming, far-seeing, clear-thinking farmers in all lands made substantial contributions by way of improved methods of farming. Chinese agriculture, by way of example, may be stationary rather than progressive. Yet we find the Chinese growing crops like rice, soy beans, millet and rape, all of them admirably adapted to meet the food needs of a dense population. Many men have evidently had a part in selecting and improving the wild plants to serve ultimately as important staple food crops. Thus we have an almost endless variety of soy beans and many varieties of other food crops. The Chinese long ago recognized the value of legumes for the maintenance of soil fertility. Methods of tillage, of irrigation, of plant propagation have all been developed without any direct help from science.

In the same way the intelligent inhabitants of Europe and of South America picked out certain wild plants and thru the centuries improved and developed them until they became important food staples. Thus we have our small grains, among them the wheats, barleys, rice, oats, the many types and varieties of Indian corn, the almost endless variety of vegetables, fruits, berries, etc. Also in dealing with domesticated animals many practical men displayed keen judgment and knowledge and helped to establish our valuable races of beef cattle, of sheep, of goats, dairy cattle, swine, horses, domestic fowls, etc.

When the natural sciences, among them chemistry, physics, botany and zoology, came to play a more direct part in the life of the city as well as of the country districts, a solid and broad foundation had been built by thinkers and workers whose names are now no longer remembered, but the fruit of whose work persists and will always live. On this foundation the building of the super-structure has been rather rapid. Chemistry has shown us the secrets of plant nutrition. We know now much about the composition of soils and plants, about the chemical transformations that take place in both of the part played by invisible organisms in the feed of crops, about the sources, composition and value of manures and fertilizers. Thanks to the development of physics and mechanics, we have been able to harness the energy of coal, of petroleum, of the wind and of the moving waters. The gasoline engine has come to play a large role in the everyday affairs of the farm. The great network of our railroad systems, our highways, our canals, the rolling stock of the railroads, the trucks, the tractors and the power-driven shipping are all of recent origin.

In the same manner we owe much to the investigations of the biologist and his contribution to the science and the art of nutrition. We have learned in consequence not only how to feed our domestic animals more economically and more effectively, but have learned to appreciate the value of different food constituents, of the proteins, of the carbohydrates, the fats and those other constituents which mean so much in helping the animal to assimilate its food and to maintain in their normal condition all the vital organs.

The entomologist and the plant pathologist have made their contribution in developing methods of protection against enemies that cause vast losses. Methods of seed treatment, methods of spraying and dusting are a powerful help in making agricultural production efficient. To the plant breeder we owe much for developing improved

varieties and types of plants and of pointing the way toward the establishment of races of disease-resistant species. To the bacteriologist and pathologist we owe a great debt for having placed in our hands the knowledge of parasitic organisms, of the ways in which these enter and develop in the animal body. They have told us much about immunity and resistance to disease and have laid the foundation for developing artificial resistance to disease. Many diseases formerly very destructive are no longer as troublesome, as, for instance, hog cholera, glanders, anthrax, foot and mouth disease, etc.

As the natural sciences were developed constantly new applications were found. In commerce, in the industries, in transportation, in the home, scientific investigations and discoveries came to be felt. It was recognized soon after the middle of the last century, that agriculture, like the growing city industries, was badly in need of all the help it could obtain from the natural sciences. The recognition of this fact led to the establishment of experiment stations in Europe, France, the Scandinavian countries, Germany, England and Italy began to make important contributions to agricultural science. The farmers of Europe, recognizing the declining fertility of

same may be said of variety studies, of improvement of plants by selection and breeding, of the introduction of new crops or of superior strains of crops already cultivated. Likewise, in the case of the feeding of animals, the breeding of animals, the housing of animals and the treatment of animal diseases, the experiment stations have rendered yeoman service. Any attempt to deal in any detailed way with the successful solution of special problems in special localities would be beyond the scope of this article. The readers of Pennsylvania Farmer will recall from their own experience many instances where science applied thru the investigations of the experiment stations in the United States, and in other countries, has served to modify in many essential respects the nature of our agricultural methods. Because of the application of the results of scientific studies and investigations the farmer's life of today as well as the farmer's methods of the present day are different from those of a generation ago.

All told, the American experiment stations have been a profitable investment. If properly supported they will continue to be a profitable investment. It is fortunate that, as the results of the investigations of station workers have accumulated, the need was recognized for making these investigations count more and more in the everyday life of the farm. Hence, there were organized extension departments thru whose different agencies, including the farm bureaus, the fruits of inventions, discoveries and investigations have been brought to the farmer or to the industries serving the farmer. The extension service has been liberally supported and has acquitted itself well in performing the work assigned to it. But, in our endeavors to strengthen our extension service, we have forgotten for the moment that there are many questions still unanswered. Many problems still unsolved. We have forgotten that the earlier investigations of the experiment stations have often dealt with the less difficult problems. The experiment stations have still much to do. In many respects their help is more badly needed now than it was a generation ago, since the business of agriculture has become more complicated. New insect and fungus enemies are constantly appearing. We must have methods for dealing with them effectively. The art of feeding farm animals has changed with the changing conditions in our social and industrial life. Animal diseases are more troublesome than they have been in the past. The introduction of new fertilizers, of new types of agricultural machinery, of mechanical power, have all introduced new and distinct problems that call for careful investigation. Farm management studies or the investigation of numerous problems relating to the farm home are as pressing in their nature as are some of the other problems. The scope of the activities of the experiment station should be widened to provide for a study of these and other problems. If the experiment stations have been helpful in the past, they can be made even more helpful in the future. It would be unfortunate, indeed, if, in our anxiety to strengthen the teaching in our long and short courses in agriculture, our farm bureaus, our home demonstration work or our club work, we forget that all of these rest on the foundation of investigational progress that can only be supplied by the experimental stations. We can not afford to forget that the American experiment stations are deserving of the best trained men and of the best equipment in order that their experiments and investigations may not be halted and that they may be permitted to explore the unknown and to hold up the hands of the farmer who is trying to adjust

Self Mastery is the essence of heroism.—Emerson

A Favored Section

EASTERN FARMERS are to be congratulated upon the fact that they are working under more favorable conditions than farmers in any other section of the country just at this time. While we do not believe in entertaining any feelings of exultation, yet the fact that they are close to good markets and sources of supplies in these days of almost prohibitive freight rates enables them to receive more for their products than do farmers in any other section of the United States. Farmers in the territory covered by Pennsylvania Farmer have close at hand millions of consumers who must have a daily supply of food and this food can be produced largely in the territory and delivered at little cost. Of course, prices are not what they should be but when compared with what is left to those who must ship hundreds or thousands of miles they are distinctly to the advantage of the Eastern farmer.

Itching Palms

ONE OF THE BEST things that could happen the human race would be a complete lapse of memory concerning prices, wages and profits received from 1915 to 1920. The desire of many retailers to continue gathering in the shekels at the rate obtaining in the halcyon days of the war is the greatest cause of stagnation in business today. In general, the wholesale prices of producers and manufacturers have been deflated far more than have the retail prices. The so-called "buyers' strike" is still on and goods are not moving except as necessity compels buying. President Harding in his message to Congress refers to this state of affairs in the following passage:

"Reducing cost of basic production has been recorded, but high cost of living has not yielded in like proportion. For example, the prices on livestock and grain have been deflated, but the cost of bread and meats has not been adequately reflected therein. It is to be expected that non-perishable staples will be slow in yielding to lowered prices, but the maintained retail costs in perishable foods cannot be justified."

This situation bears down heavily upon farmers, manufacturers and others whose products must pass thru one or more hands, because when trade is choked in the retail channels production must be reduced to meet the lessened demand or disaster follows. But up to this time "profit-taking" has not been defined, nor has any successful means of prevention been applied, except in a few instances. It is high time to forget there ever was such a thing as war profits.

Pennsylvania Farmer

"Caution in Co-operation"

THE MASTER of the National Grange in an open letter in the National Grange Monthly warns members of the grange to be cautious concerning many of the plans for farmers' co-operative enterprises now being promulgated. He does not specify which particular activities or movements he has in mind, but he deprecates the fact that such a great number are being launched, many of them built upon hopes and promises which he feels can never be successful. National Master Lowell says nothing that would lead us to believe that his caution is inspired by jealousy of other organizations, or that he has other than the best interest of farmers at heart. Taken at its face value, we are inclined to approve the letter of caution.

There never was a time when farmers had such a multiplicity of schemes presented for acceptance. Organizations are launched for almost every conceivable purpose, some of them for activities which are evidently outside the farmer's province and ability. Many of them have been tried time and again and always at a loss to farmers and a set-back to the work of legitimate organization. Every industry has its definitely set boundaries for its activities and it is a mistake to go outside of them. We have always argued that farmers' organizations should be devoted to social and educational improvement, economical production, and the promotion of business-like selling and marketing systems. These will cover the everyday needs and when it is desired to exert political influence concerted action can be secured thru federation. To the discouragement of over-ambitious, visionary schemes we say, Amen.

Opponents of Prohibition

WE DOUBT if it is worth while for temperance people and all lovers of good government to become unduly alarmed over the final accomplishments of the proposed national league to repeal the Volstead Act and possibly the Eighteenth Amendment. But it will be necessary to remain vigilant and active to offset the political influence which this organization proposes to wield. The reason which these misguided people give for wishing to repeal the prohibition law is that it is being violated, hence is should be repealed and thus save people from becoming law-breakers. The same logic might be applied to other prohibitory laws, such as those against murder, theft, arson, wife-beating, etc., all of which are broken every day. Would it not be equally desirable to repeal all such laws and save those who murder, steal, burn buildings or beat their wives from being law-breakers? These people are moving on the theory that breaking a law is, per se, more harmful than the commission of the act which the law seeks to prevent.

For some reason or other, most of the city papers continue to discuss the prohibitory law and its violation in a manner encouraging to violators and opponents of the law. During the war these same papers could not find language sufficiently strong to condemn those who opposed some of the national war measures. Is it possible that some Federal laws may be violated with impunity, and that aiding and abetting violation is sometimes a virtue? It would seem that some newspapers have this double standard.

The World's Labor Troubles

THE GREATER part of the printed labor news of the country is devoted to a discussion of unemployment and the necessity for reducing wages and makes little mention of the under currents of thought. For months there has been a persistent effort to bring about a reduction in wages from those paid during the past three or four years. Organized labor all over the world is making a strenuous effort to keep wages from going back to the pre-war level, and the re-establishment of the living conditions of that time. Labor's claim is that the cost of living has not been lowered sufficiently to meet the reduction proposed by employers.

Farmers have a vital interest in the income of the laborers of the world aside from the direct question of farm wages. They know that the

sale and market price of their products depends chiefly upon the ability of consumers to buy. They learned during the war that high prices were readily paid when people had plenty of money. For this reason thoughtful farmers are not in sympathy with the old-time conception of what a living-wage consisted, namely, merely enough to maintain an existence. On the other hand, however, they realize that if wages in the industrial world are too high and the hours too short the balance between country and city is upset and profitable farming becomes impossible.

It is just as well to face the facts as they exist today. The troubles of Europe are not confined to mere political revolutions. Just at this moment England is in more acute trouble internally than that she was at any time during the war. She is threatened with a complete tie-up of her industries because of the failure of the government and employers to make terms satisfactory to labor. Labor asks a share in the management of industry and a pooling of the profits.

We must not assume that because there is much unemployment in this country that we are past the danger of troublous times. The future will depend largely upon the outcome of the contest in England. If labor wins there we may expect a stiffening up of demands here. This situation viewed, in the light of the more or less concerted and nation-wide effort to reduce wages, should not be considered lightly. While we have no wish to cause alarm, we call attention to this world-wide struggle so that we may use our influence intelligently if occasion offers.

Who Will Pay the Piper?

ONE of the biggest questions confronting Congress is that of tax revision. For months there has been a persistent agitation, especially by the big interests, for "relief from burdensome taxes." There has been a universal demand by those who pay excess profits taxes that the law levying taxes on excess profits shall be repealed. The common people will demand that if this is done excess profits must go also. As a simple matter of justice Congress should see that every citizen pays his just share of tax and pays in proportion to his ability. But the country is being flooded with propaganda in favor of the sales tax idea which is to place a tax on every article sold. This would mean that consumers would pay all the tax. The poor man with a large family would pay more tax proportionally than a man having a small family. If it is possible to do it, it should be made impossible to pass the tax on from those most able to pay it to those least able to pay.

The expectation of being relieved from heavy taxes is childish and the desire to escape payment of a just share is unpatriotic. This country is under the necessity of raising between four billion and five billion dollars annually for an unknown period. This means a yearly tax of about \$40 on every man, woman and child in the nation. The great bulk of the people cannot bear such a tax and live decently and for this reason wealth rather than individuals must be made the basis for assessment.

But the national tax problem is no greater than that of state, county and local governments. Each of these in turn is finding it difficult to find sufficient money. It is so much easier to increase the assessed valuation and advance the rate than it is to find new sources. Corporations and big business raise a mighty howl and threaten to pull up and leave a state if increased taxes are levied. Usually, this is pure buncombe. It is no easier to move a coal mine, a railroad, or an oil well than it is to move a farm into another state. The real difficulty is that too many law-makers are loyal sympathizers with corporate property owners. Pennsylvania is just now having an object lesson on this subject.

In spite of the universal difficulty in finding enough money to fill the public treasuries, there is a continuation of the tendency to increase salaries and create new jobs. President Harding did well to emphasize the need for greater economy. Of course, public institutions must not be allowed to suffer, but it is time to stop filling pork barrels and creating political sinecures. There is need for the practice of thrift and economy by every branch of government, and since the com-

mon people will be compelled to practice these qualities as never before, they should see that public servants do likewise, or else turn them out to earn their bread by more arduous labor. The piper must be paid and all who danced must pay their share.

Our Washington Letter

The executive committee of the American Farm Bureau Federation and delegates representing thirty states held a conference in Washington during the week ending April 16.

Rural Credits.—In a discussion of rural credits, Commissioner A. F. Lever of the Federal Farm Loan Board gave his approval of the federation's commodity financing bill. Governor W. P. G. Harding of the Federal Reserve Board, told something of the workings of the Federal Reserve system. He said the profits of the system which this year will amount to \$100,000,000, should be used as a fund to enable the Farm Loan system to handle short time credits on cattle, grain and the like, and that this plan would work well in making effective the commodity financing bill. He also pointed out the necessity of re-establishing foreign trade, showing that the lack of trade with foreign countries caused products to be dumped in large quantities here.

Taxation.—The subject of taxation was discussed by Prof. T. S. Adams of Yale University, advisory expert for the Treasury Department. Mr. Adams said he believed in the income tax and that a breakdown of the income tax feature would be a tragedy. The present extreme rates he considered to be bad for the income tax feature. The surtaxes should be reduced and excess profits taxes wiped out. He warned the farm bureau people that the income tax system would go to smash if they insisted upon making it carry a heavier load than it could bear. Farmers can block a reduction of income taxes, but it will be a mistake to do it. The biggest danger to any tax system is an excessive rate. The excess profits tax should be repealed because it is not practicable. Mr. Adams wrote all excess profits tax legislation, and is convinced that it cannot be made to do what it was intended to do.

Mr. Adams said he was opposed to a general sales tax. It is a distinctly impossible tax. It would yield a large amount of revenue, but cannot be substituted for the income tax. It would not simplify our tax system, but would inevitably add to its complexity. He would substitute a five per cent corporation income tax for the surtax and excess profits taxes. There is no more chance of wiping out the income tax than in doing away with the tariff. The sales tax would be bad for business generally. Congress is continually besieged with people making applications for money. If it were shown that a new tax was popular, they would pass it and spend more money. It would not mean a lessening of other forms of taxation, but more money for Congress to spend. The worst enemies of the country are the men who invent new taxes, said the speaker. Nevertheless a great financial organization is spending a great deal of money in a propaganda to put the sales tax over.

In regard to the Ralston-Nolan land tax proposition, Mr. Adams said it would not be equitable, and he did not believe the Federal Government could carry thru any such assessment. He did not care to make further comment on this measure, because there was not the slightest chance of its getting consideration in Congress in the near future.

Tariff.—W. S. Culbertson of the Federal Tariff Commission addressed the federation on certain phases of the tariff which are of direct interest to the farmers. Mr. Culbertson emphasized the fact that we are now entering a period in which tariff duties on a number of leading farm products would help the farmers, and the producers are as much entitled to protection as any other class, nevertheless the impression received from his talk led to the belief that in so far as food products are concerned the consumers' interests will be given much consideration in arranging tariff schedules.

It was recommended that the equitable way to levy a duty on wool was on a scoured basis. It was pointed out that the duty on mutton was one case of the tariff being of direct value to the farmers. Enormous quantities of frozen mutton are being imported, last year's importations equalling one-fourth the amount of mutton produced in the United States. The cause of the enormous heavy importations of foreign products at this time was due to the fact that this is the only country in the world where these products can be sold for cash. Foreign shippers are rushing raw wool into the United States in vast quantities, although the stock already here is sufficient to last two years. The men who import wool and hold it will get the benefit of the tariff.

The necessity for legislation to protect the dairy industry in this country from Oriental vegetable oils was mentioned, but this situation cannot be wholly remedied by a tariff as practically all the copra imported into the United States from which vegetable oils are made to a large extent, comes from the Philippines, a part of our own territory that would not be affected by a tariff.—Elmer E. Reynolds.

Pennsylvania Farmer

HARRISBURG LETTER

Legislation Jammed.—At this writing most of the big bills of the session have gotten into a jam, but the Sproul adherents have some powerful means to produce a breaking of any attempted tie-up because of the Governor's power to reduce appropriations. The pocketbook nerve is very sensitive and the charity that gets a state appropriation still looms large in the view of the average legislator. While the revenue raising bills are occupying the Department of Welfare convention and the Department of Welfare measures are being shot at the appropriation bills are going right along and if the Governor escapes the fate of other Governors in having to reduce appropriations left by the departing legislators he will be lucky.

Progress of Legislation.—The Legislature has passed bills worth while in the measures to control sale of seeds; to require assessors to collect agricultural data; to stiffen up penalties for falsification of horticultural laws; to enable eradication of thistles and other weeds by raising the limit of pay and by various minor agricultural steps, but what will be the record in regard to rural education remains to be seen. More pay for teachers and more aid for rural districts are likely.

State Fair Started.—The State Fair project has been given a start at least. The men in charge of the purse strings have agreed to appropriate \$15,000 to have plans made, sites inspected and optioned and a report made. While friends of agriculture are disappointed the way has been opened for an exhibition such as the state certainly needs.

Money for Forests.—In addition the Legislature is about to vote the highest sum yet given for purchase of lands to extend forest reserves and to fight the fires. The Pinchot program may not be adopted in its entirety but a substantial start is assured and the state will get its money's worth. Popular sentiment has manifested itself.

State to Get More.—It seems certain the State will get more interest for the millions it has on deposits. Whether the Legislature will adopt the plan to have a board regulate the interest according to the prevailing rates or whether the makeshift bill to raise the rate will go thru the State stands to secure more. Whether the rural school districts will get their money more promptly, of course, cannot be stated now because the general fund from which it is taken is extremely low owing to the tremendous drain of the appropriations of 1919 which are still being paid.

Forest Fire Troubles.—Forest fires have afflicted many counties this year and have come at a good time, if it may be said, to demonstrate the value of a fire fighting system. In some counties the fires have been controlled within small limits, thanks to the preparations made last winter.

Fewer Fairs.—The list of fairs to be held this year shows a decline as compared with some former years. A number of exhibitions have gone out of business since the war and the influenza epidemic and others have struck hard times because of expense.

Employment Bureau Makes Good.—Reports coming to the Capitol are said to show in every section of the State farmers have been able to get good farm hands, and unemployed men to get work, thru State employment agencies. These agencies, especially in the central section, sensed the situation away back in the fall and began a series of "farmers' days" on which farmers and people wishing to go back to the farm or to go to the country could meet. Steps were also taken to send thru the countryside information as to the way railroads and industrial establishments were furloughing people. The result has been "placing" of hundreds of people and the building up of a system that will be valuable in years to come. Incidentally, it may be said that the idle farms of the last three years have been taken out of what was mislabeled the "abandoned" class. They will soon be blossoming again.

Eggs are Stored.—A difference of something like three and a quarter million dozens of eggs in storage on April 1 as compared with January has been reported by the cold storage warehouses to Director James Foust. The big increase is attributed to the heavy laying because of mild weather. There is also a gain in poultry and pork as well as butter.—Hamilton, Harrisburg.

NEW YORK LETTER

Pooling Progress.—On March 20 the Dairy-men's League had received over 46,000 of the 50,000 signatures needed to make the pooling of milk sales possible. They have since come in rapidly and the League will continue to take contracts that all of the 73,000 now actually delivering milk may come into the plan harmoniously. Tompkins County is arranging for at least five pooling plants, and other counties are preparing to pool in May. A debate between Paul Smith, League director, and a representative of Nestle's Food Company was listened to by farmers of two counties at the State College on Saturday. The Nestle firm will not recognize the League and has lost all but about 250,000 lbs. of the milk it was formerly receiving at the rate of 60,000 lbs. a day. Dairymen everywhere are counselled to

ignore all firms that will not recognize the League.

Legislative Notes.—Governor Miller signed the bill appropriating \$90,000,000 for state expenses without cancelling one item. This is the first time this has been done since Theodore Roosevelt was Governor, and marks real co-operation in cutting expenses in all departments. The bill to impose a literacy test on voters has passed the Senate, and seems likely to be submitted to voters next fall. New York City finds that Governor Miller's prohibition amendment can be enforced. A halt has been called on appropriations to build a big elevator at Oswego, as work can proceed this year without further appropriations.

Fruit Greatly Injured.—Central New York apples are said to be injured 85 to 90 per cent. The famous Hinchings orchards are nearly a total loss. Spies may come thru with fruit. The temperature went to 18 to 20 degrees this week and cherries, plums, pears and peaches are all seriously injured except in western counties and those near the Great Lakes. This is the second serious freeze since warm weather set in.

Farmers Use and Need Automobiles.—A wide survey tallies with state registration figures and shows that 33 per cent of the cars are owned in the rural districts and only 9 per cent in the 12 biggest cities. New York has a car to each nine persons.

Farmers' Price Insurance Thrives.—The G. L. F. Exchange is proving the farmers best price insurance as local dealers are forced to meet Grange prices on farm supplies. In one town the dealers asked \$24 to \$28 a ton for 16 per cent acid phosphate. The G. L. F. price was \$21. The local dealers dropped to \$19. In such cases farmers should still be loyal to their own exchange and ask the dealers who forced them to come off their high horse. Only loyalty like this makes possible the million and a half dollar business the G. L. F. has done since January 1. This big business is an increase of 50 per cent over last year's business. There are now 50 local co-operative branches and 22 representatives of the exchange doing business for the farmers of New York.

NEW JERSEY LETTER

Egg Storage Leaps.—There were 161,162 cases of eggs in the cold storage warehouses in New Jersey on March 31 last as compared with February 28 last when there were only 579. There was also an increase in the number of pounds of broken eggs stored in that period, 257,270 being in the warehouses on February 28 while on March 31 there were 467,190. These and the following comparison of amounts of foodstuffs stored as between the dates mentioned were given out by the Bureau of Foods and Drugs of the State Department of Health: Cheese, Feb. 28, 470,609 lbs., and March 31, 209,273 lbs.; butter, Feb. 28, 1,063,763 lbs., and March 31, 630,035; poultry, Feb. 28, 6,538,754 lbs., and March 31, 4,623,593 lbs.; fresh meats, Feb. 28, 29,362,125 lbs., and March 31, 27,000,701 lbs.; fresh fish, Feb. 28, 1,502,407 lbs., and March 31, 1,043,899 lbs.; milk and milk products, Feb. 28, 755,325 lbs., and March 31, 715,587 lbs.; game, Feb. 28, 6719 lbs., and March 31, 100 pounds.

Governor Kills Bills.—Two bills passed by the Legislature at the solicitation of pure food advocates have been disapproved by Governor Edwards by filing them in the State Library. One sought to increase the nutritious quality of ice cream, while the other was designed to fix a higher standard for condensed milk. Both measures, in the opinion of the Governor, interfered with established business. Governor Edwards also disapproved of a bill providing for the addition of approximately 500 miles to the New Jersey highway system. Among the last measures to be signed by the Governor was one permitting counties to outline advance programs for highway improvements for approval by the State Highway Commission, and another allowing the State Highway Commission to enter into contracts with owner of toll roads and bridges before taking them over.

DELAWARE NOTES

The recent fall of 60 degrees in the temperature accompanied by cold rain, hail and sleet, and followed by a severe freeze has made fruit growers apprehensive that the prospects for fruit this year have received the severest blow in years. Reports from various sections of the state indicate that the temperature went as low as 24, reports ranging from that figure to 28. At one place, it was said that the thermometer registered as low as 20 degrees. Garden truck generally was not far enough advanced to be greatly damaged, but in a few places peas and beans were reported up and killed by the freeze. Strawberries in some sections were reported killed. In other sections the plants were not far enough advanced to be greatly damaged. Reports from that section of Kent County around Dover are that practically all the fruit has been killed, including strawberries, and it is believed that grapes are also badly damaged. One fruit grower in the central part of Kent County, after going thru his orchard, declared it looked as tho the trees had been struck by fire, so black were they where the buds had been killed. Peach and pear trees in Kent County and most other parts of the state were practically all in bloom and early apples were in blossom, reported Frank Bancroft of Wilmington.

A Power Cultivator for All Trunk Crops

New 1921 MODEL

Merry Garden Auto-Cultivator

Solve your labor problem with this dependable newly improved latest model implement, equipped with Bosch Magneto, Governor, water-cooled motor, case hardened gears, correct bearings, no trouble lubricating system.

DOES WORK OF FOUR MEN

Cultivates, harrows, discs any soil, clay, sand, loam or muck. So easy to guide, turn, or back up, a child can run it.

Truck farmers, gardeners, and estate owners find it more than PAYS FOR ITSELF each season.

Guaranteed to do all we claim, or money back—after 5 days trial. Price \$250.

Helps on Machinery Problems

By F. A. WIRT, Mechanical Engineer

How can I best and most quickly learn to operate a tractor and get good results?—A. B. S., Blair Co., Pa.

The very first thing you should do is to get a copy of the instruction book furnished with the tractor and read it thru very carefully. Then, after you have had the tractor started on your farm, read the instruction book again with the tractor before you and be sure to understand each statement before reading further. Pay particular attention to the starting and stopping of the tractor. One new tractor owner found out how to start his machine but did not learn thoroughly how to stop it. He ran over a good sized tree and did considerable damage.

Before putting the tractor to work, either plowing or driving on the belt you will find it time well spent to maneuver the tractor turning, running forward, backing, hitching to machine, etc.

Don't whatever you do, overload the tractor at first to see if it will pull a big hill on high or pull too heavy a thrasher up-hill. This practice is altogether too common and shortens the life of a tractor by months, in some cases years.

frequently; (2) Don't overload at any time; (3) Lubricate regularly with good quality of oil and grease; (4) Keep all nuts tight; (5) Have regular schedule for lubricating and overhauling.

Why is it that I get uneven stands of corn when planted with my corn planter? I have a good make and it is kept in good repair.—B. T. W., Salem Co., N. J.

After the seed corn is ready to plant the kernels should be tried for "fit" in the cells of the plates furnished with the planter. Choose the plate which seems best and they try out the planter by any one of several methods:

Jack up the planter frame so that the drive wheel can be turned by hand while the forks are tripped quickly similarly to action of check-wire. Some one should catch the kernels as they drop and keep a record of accuracy. It may be necessary to try another plate. You will notice a surprising difference in the accuracy of different sizes of plates.

One corn grower whom the writer knows, fills the hoppers and runs the

PLANS FOR THE KING ROAD DRAG

Showing Details of Construction of a Seven-foot Drag. Dotted Lines Indicate Platform Boards

In the actual operation of the tractor you will find it profitable to pay particular attention to lubrication. The right oil and grease in the right place at the right time is a wonderful money-saver. Good lubrication saves repairs and breakdowns, does more to prolong the life of the tractor and increase the profits of tractor-farming than any other factor.

"Keep all the nuts tight" speaks volumes. It is the best kind of advice and should be followed with the utmost care, daily at first, and later at least once a week.

And by all means, have a regular schedule to lubricate and overhaul the tractor. Time spent twice a day, daily, weekly and monthly, according to schedule, will pay you big dividends, and when you have a rush job you will be using your tractor while your neighbor who does not pay attention to regular and systematic care, will be saying harsh things about his tractor when he has only himself to blame. It might be mentioned incidentally that the tractor owner who spends a few minutes daily in keeping his tractor clean, seems to get the best results.

To sum it up briefly: (1) Study the instruction book and refer to it

cut clean. The knives were all sharp.—W. B., Lancaster Co., Pa.

The trouble you mention is due to lack of a shear-cut at one of the guards. The action of a cutter-bar is exactly similar to a pair of scissors which will crush or "chew off" a piece of cloth unless the blades fit snugly. The cutter-bar should also be examined frequently as the guards are easily loosened or bent out of line. Light blows of a hammer 1 1/2 inches back of the point will drive back into line any guard which is bent up or down.

How often should I change the oil in the crankcase of my tractor? A. S., Maryland.

Frequency of changing oil in a tractor crankcase depends upon (1) kind of gas engine oil used; (2) amount of work done; (3) efficiency of engine in using kerosene.

The manufacturers recommend changing oil in crankcase every 30 to 60 hours of work done. By using only the best oil obtainable, and by getting the most out of the fuel, you can tell by "feeling" the oil between the fingers before draining the crankcase whether or not it is safe to use it longer. Under no circumstances us the oil longer than for 60 hours of hard work, then drain, wash out the crankcase with kerosene, and refill with fresh oil. The old oil can be strained to remove the sediment and then used for oiling farm implements. It is better to change more frequently and have a smaller repair bill.

A TRACTOR TRAILER

One of the first things we found that we needed after buying a tractor was a light trailer that could be used to haul oils, gasoline and supplies to the lower end of the place when the tractor was being used down there. While the trip back and forth from the house to the field is not far, the supply of fuel and oil on hand in the field is convenient, making it unnecessary to make the trip with the tractor more than once a day.

Nearly every farmer has at least two stout metal wheels he can use to make a supply cart to be drawn behind the tractor. The one shown in the accompanying photo answers the purposes very well and is useful about the farm as well. One objection to it is that the wheels are a little too high which makes it a little difficult to fill the oil drums, but once filled the fuel is easily drained out to put into the tractor tank.

The making of the hitch was a very simple matter as may be seen. The pole of the wagon was inverted and reinforced with narrow metal strips. While the tongue is low enough to strike some obstructions, the tongue is flexible enough to pass over almost anything the tractor will clear.—J. L. J.

Farm Organizations

The National Organization of Farmers

By FRANK APP, New Jersey

THE PUBLIC wants to know why he could obtain by engaging his there should be a national services in some other industry. movement abroad which is perfecting a national farmers' organization, supported by paid membership from practically every state, county and community of the nation. Heretofore we have had, here and there, a number of local farmers' organizations, a few of which functioned as national, for one phase or another of the agricultural industry, but most of which were merely local and had a restricted influence on the farmers' interests. The present movement has been prompted by three important phases pertaining to agricultural welfare and industry. These are namely, business, legislation and education.

Farming as a Business

Today, farming is becoming a profession or a vocation, the same as other business interests. Heretofore, the farm was more or less a home and place to live while at the same time it afforded those who dwell there the means of a livelihood by furnishing a house to live in and food which was raised largely by the farmer's own efforts. Years ago farming represented the business of almost the entire population. When the first census was taken 90 per cent of the people of the United States were engaged in farming. Consequently, it was practically the only means of livelihood. But today, it is placed on a plane, where it is essential that it can compete with other industries, by affording the individual a return commensurate with that of other industries. It must allow him the comforts as well as the necessities of life comparable to that of other walks of life.

The Farmer Essentially a Producer

Up to the present time, the American farmer has been almost entirely a producer. In this he is most efficient. If we compare him with the European farmer we find that he produces from two to three times as much food as a farmer in Europe. This fact has made the United States the prosperous nation it is. It has allowed cheap food for the consumer, has made possible the building of great cities and has afforded the means whereby our manufacturers could compete in foreign markets with manufactured goods and at the same time pay the highest wages of any nation to their employees. Consequently, the safe, sound and economical production of food is and must remain the basis of our national prosperity, both agricultural and industrial. At times, the public feels that the American farmer is not a good business man, and that he is inefficient and unprogressive. Frequently, the most successful business man from the city attempts to demonstrate a farm efficiently operated. Almost without exception their attempts have been failures, due to the fact that they were not well enough informed to run a farm economically. The production of food must be left to those trained in agricultural production. It must be left to the farmer who is prosperous because the industry affords him an income commensurate to that which

Forces of Industry Have Changed

Today, the industries of the nation have changed to such a degree that it is compelling a similar change on the part of agriculture if it shall remain a strong, substantial and virile industry. At the present time approximately one-third of the population is actively engaged in farming. This means that one-third of the population produces sufficient food for itself and the other two-thirds. It means that farmers are competing for labor, capital and material with the manufacturer and the trader.

System of Marketing Broken Down

The farmer is the only producer of large quantities of goods who gives entire control of his product to a dealer as soon as it leaves his farm or place of production. This system was built up by degrees because the agricultural production is conducted by such a large number of individuals. It was not economical for one individual to take care of his product until it reached the consumer, or to see that it arrived safely at the consumer's door. Consequently, there was developed a system which handles the agricultural products from the time they leave the farm until they reach the consumer's table. With the stress of more recent conditions this machinery has broken down, and entails a hardship to the farmer as well as to the consumer. The margin between what the farmer receives and what the consumer pays, is out of proportion to the service rendered.

It means that our system of distribution, is no longer satisfactory. Wherever this is true, it will be necessary for the farmers to act and bargain in a collective way to market their products, to retain control until their products are on the market or within the reach of the consumer. Such a need must be promoted by a large organization which has the moral and material support of the majority of farmers. This will necessitate commodity organizations controlled by the farmers who can pool their products or market thru a central selling organization and place them on the market in an orderly fashion. They will need capital and storing facilities as well as high-class employees to handle and manage the marketing associations. It will mean that they need to employ some of the methods which have been used in the past by big organized business interests. It will mean that farmers must employ someone who can promote and prepare the best methods of handling and selling; the proper advertising of products, the proper grading and the distribution needed both as to time, place and manner. It will necessitate going back to the old custom of which you will read in the Good Book where a certain Jew stored grain during years of plenty for the years of famine. It will need to have laws which will allow storage of stable products during years of plenty.

(Continued Next Week.)

SUMMIT PIPELESS FURNACE

A FURNACE built by the Summit Foundry Co. can be relied upon in every detail of construction, and for the quality of materials that go into its making. A thorough test by experts before your furnace leaves the foundry eliminates all chance of hidden defects. A Summit Pipeless never has been returned to us for any reason whatever.

No Cold Air Floor Drafts with the Special Summit Installation

Two cold air returns placed at a distance from either side of the hot air register take in the cold air, which is returned to the heating surface of the furnace, without having to pass over the floors on its return. This is a great improvement over the average one-pipe furnace

SHORT CUTS WITH THE CORN CROP

(Continued From Page One).

box or the rag doll tester to give you a report on the germinating qualities of every ear intended for seed and use only those ears upon which you get a report which is 100 per cent favorable.

Grading

A uniform stand depends not only upon high test seed but upon seed of uniform dimension. Where there is a wide variation in the size of kernels it is inevitable that regardless of the drill plate used there will be occasions where two grains will be dropped instead of one and still others where owing to unusually large grains a complete miss is experienced. The grader sizes the corn after it is shelled, eliminating the very small, the very large and misshapen kernels and insures the planting of one grain and only one each time a slot in the disc passes over the aperture in the bottom of the hopper.

Controlling the stand of corn then becomes a simple matter with tested, graded seed. You plant with confidence and ignoring the formula of our fathers "one for the blackbird, one for the crow, one for the cut worm and two to grow" you plant at such intervals as you desire permanent stalks. This will vary according to the latitude and altitude of your situation. Where a growing season of one hundred and twenty days is the rule and large varieties are consequently grown eighteen inches is none too far apart for maximum development of ears while in the latitudes having a ten-day to two weeks shorter season the approved distance will be in the neighborhood of from twelve to fourteen inches. Thru testing and grading, then, the writer asserts that the two rather time consuming and expensive operations of replanting and thinning corn become unnecessary, that the time saved reduces the ultimate cost of a bushel of corn and enables one to give other farm enterprises additional and profitable attention. This is not only the writer's theory but his successful practice.

Exit the Hoe

The man with the hoe may be a poetic figure but in the corn field he is first of all expensive. The average farmer can keep his hoe hanging in the wagon shed thru the entire season and still maintain a clean field unless handicapped with soil that is polluted with weed seed or by a succession of rainfall rendering cultivation at the critical time impossible. Fall plowing, aside from many other considerations in its favor is one means to this end. The plowing within itself has no effect but the practice enables one thru periodic workings from say April 1 to May 10 to kill off successive crops of weeds. Where plowing precedes planting by only a few days it is exceptional if the weed problem does not become serious and remain so thru the season. Early and deep cultivation pays. Before corn shoots thru is the approved time for the first or "blind" cultivation of rows using a double worker with shields to prevent earth from being deposited on the corn rows. Immediately following this and before the shoots have made their appearance the use of the weeder is very helpful in killing the tiny weed plants that inevitably grow within the row. Perhaps no implement on the farm has been

used and discarded to the extent of the weeder. It is to be found in lofts, gullies, fence corners and diverse places and yet in the program of weed control in cultivated crops especially corn and potatoes it is indispensable to the man who understands and appreciates its use. Weed control calls for an aggressive policy; the weed plants must be assailed at a tender age and the implement in question used when the plants are tiny has no equal. Subsequently the cultivation of corn will be with the two-wheeled scalled double worker and after each rain or as frequently as a well-balanced farm working schedule will permit. In spite of the treatment described weeds persist within the row a careful man on the cultivator driving slowly can often throw enough dirt to smother the weed plants without injury to the corn. Some growers experience great difficulty in keeping rag weed and lambs quarter out of silage corn rows but if these men will go to the very slight trouble of planting soy beans in the row with the corn, their weed troubles will cease, their corn if anything will be heavier for the association with a legume and the protein content of their ensilage will be materially increased. There is no room for weeds in a corn row that has a thrifty, inoculated, quick growing soy bean plant every two or three inches. It should be noted at this point that the beans in order to come up promptly if at all must be planted at a shallow depth and the weeder has no place on this section of the field.

To Cut or Not to Cut

Recent labor costs and shortage have popularized to a marked degree the practice of husking corn from the standing stalk. While this has been the approved method in the corn belt for years only recently has the practice gained headway east of the Alleghenies. Anyone who has traveled thru much of our eastern farming section this winter and who has been familiar with eastern methods in the past cannot help being impressed with the large acreage which has been cared for in this way during the 1920 season. Obviously the same acreage can be handled in less time and with less labor than when cut and husked in the usual manner.

Where the fodder is necessary as winter forage it cannot be handled to such advantage as many of the leaves are lost and the quality is impaired by too long exposure to the elements but where enough hay is available for roughage and the fodder is not required it will return considerable to the soil when plowed under not only as organic matter but as plant food. Scientists tell us that a ton of corn fodder contains about 18.5 pounds nitrogen, 5 pounds of phosphoric acid and 24.5 pounds potash representing at the present time a manurial value in excess of ten dollars. The following set of figures handed me by a New Jersey farmer who two years ago made a careful comparison between the costs of the two systems shows very clearly how the western method of husking from the standing stalk and pitching ears directly into the wagon speeds up the harvesting operation and at the same time lowers costs.

Expense of cutting and husking 1 acre—old method.
Cutting 60 shocks @ 7c.... \$4.20
6 pounds twine for tying..... .90
Husking 60 shocks at 10c.... 6.00
..... \$11.10
Expense of husking and cribbing

one acre from standing corn—
19.5 hours labor @ 25c..... 4.87
Gain per acre in favor of second method..... \$6.23

The Silo

As a means of quickly disposing of a good share of the corn crop or in other words taking a short cut at the harvest season there is nothing equal to the silo. This discussion does not cover the advantages of silage as a succulent, bulky, palatable and nutritious feed but is concerned only with the silo as an efficiency factor in disposing of a part of the crop. While the expense of silo filling may be about equal to that of caring for the same acreage by the usual method of cutting, husking, cribbing, etc., the appeal of the short cuts made possible thru the silo is very strong indeed.

A properly organized crew in a short time clears a good acreage and the operations of cutting, husking, cribbing, hauling fodder, shelling and grinding corn are at one fell swoop either accomplished or eliminated by this process. The corn harvester should be mentioned not only for its value in replacing men at silo filling but also as a practical and efficient means of cutting the main crop when cutting is a necessity. Equipped with a bundle carrier and in the hands of a responsible lad of from fourteen to sixteen years the harvester will account for from five to seven acres per day under average conditions and two men will stand up the same amount of corn. Ears that become detached from the stalk unless very few in number should be ignored by those who stand up the bundles and gathered in a wagon later on as a special job of itself.

Letting the Hogs Do the Work

Any discussion of short cuts with the corn crop would be incomplete without reference to the practice of hogging off, a practice while little known or followed in the East ten years ago is now commanding the attention of hog and corn growers on every hand. The old idea that hogging down corn was a wasteful if not slovenly practice is now in the discard and our evidence is all to the effect that instead of being a wasteful enterprise it is highly profitable. A few figures in support of this statement will serve as convincing evidence. Two years ago the Dauphin County, Pa., Farm Bureau thru co-operative work on the part of four prominent hog men of that section finished off a total of 133 hogs in the corn fields of the four farms involved. These hogs spent an average of 28 days in the corn, made an average daily gain while there of 1.9 pounds and paid an average price of \$2.02 for every bushel of corn eaten. They wasted none. More comprehensive is the report issued by the department of Agricultural Extension of the Pennsylvania State College for the same year. The work of seventeen demonstrations is summarized and shows the average number of days spent in the corn fields to be 30, the average weight of porkers when turned into the standing corn 126.5 pounds, the average daily gain 1.6 pounds, a production of 20,590 pounds of pork on 36.27 acres and a price received for corn so marketed of \$1.92 per bushel. More up-to-date are the figures summarizing the hog pasture work in Pennsylvania for 1920. The one fact that will be quoted from this summary to the exclusion of others

(Continued to Page 16).

COLONY BROODING

"Coal Stove Colony Brooding" is the title of one of the recent circulars of the Department of Poultry Husbandry of the New Jersey Experiment Station. Many helpful suggestions are offered for the proper care of young chicks during the first few days that they are in the brooder house. The importance of a uniform temperature is one of the essential points emphasized. "A few hours without heat will ruin a flock of chicks completely. High and low temperatures lead to digestive troubles. In the beginning the chicks should be confined near the hover by a low, circular barrier of wire or roofing material, which can be moved farther from the stove as the chicks accustom themselves to the house and learn to return to the source of heat. This can finally be moved just to turn the corners of the house, eliminating the danger of

Lesson 157 "Feeding for Egg Production" gives full instructions for the feeding of laying hens. Numerous tables are given which show the composition of the various common feeds, the needs of the fowl, etc., and full instructions cover the whole subject of feeding and keeping of feed and egg records. Both of these publications are illustrated with many instructive pictures and diagrams and will form a valuable addition to the library of any poultryman.

The Poultry Series of the Cornell Reading Course is published by the New York State College of Agriculture and information concerning the courses may be obtained by addressing the Supervisor, Cornell Farm Study Courses, Cornell University, Ithaca, N. Y.

"Common Poultry Diseases" published by the Pennsylvania State College is a helpful circular which contains information to which the poultryman likes to refer often. All of the more common poultry diseases are discussed and symptoms and simple remedies are given. It may be obtained by writing to the Department of Agricultural Extension, State College, Pa., and asking for Extension Circular No. 85.

EXPERIENCE WITH INCUBATOR

This is our first year to use an incubator. We planned to have an early hatch but couldn't get a proper location with proper outside temperature. The cellar in March and earlier was too cold and we had no place else that was kept evenly heated night and day. Just how we may be able to regulate it in milder weather we don't feel certain.

The mistake we have made and one that I am sure may be remedied is in the selection of machine. Get one that you yourself have examined and that is claimed to run regularly regardless of outside conditions. This is only possible in a well built incubator. The door as well as the sides all around must be made with double thicknesses of material and a dead air space between. This retains the heat inside the incubator and does not let it escape into the surrounding space.

As is generally the case the interior make of machine is the cheap one, and it pays more than pays to obtain the better article at a slightly higher price.—M. G. F., Clearfield Co., Pa.

CHICKS WITH GAPS

I have found the best thing to do for young chicks with the gaps, is to catch them and feed them vinegar bread. If they refuse to eat open their mouths and put it in, also a little vinegar. This has been tried for three generations in our family and has always been successful.—Mrs. H. S. M. Berks Co., Pa.

Cedar excelsior makes excellent nests and is not so likely to become infested with lice.

While ducks require plenty of water in the day time, they should be provided with dry quarters at night. No other fowl is more quickly injured by dampness.

HELPFUL POULTRY LITERATURE

Two recent publications that should be helpful to poultrymen are Lessons 156 and 157 of the Poultry Series in the Cornell Reading Course for the farm. The first of these is on incubation and covers the essential points in the hatching of chicks. Both natural and artificial incubation are taken up and special emphasis is laid on the testing of eggs and the proper methods of handling them after they have been put in the incubator.

There Is A Gold Mine In Your Garret

Unless your garret is different from most folks, it has a lot of old discarded furniture in it, too shabby to use. Furniture, such that love nor money couldn't buy today. It's altogether too good to have up there. Bring it down and restore its youth with Vernicol Varnish stain. Whether

it's mahogany, oak or walnut, matters not, there is a Vernicol finish for each. No trick to use it. Goes on with a brush just as easy as spreading butter on hot toast. It sure does make things do by doing them over. Sold by the best dealer in each town. Send to this address for Vernicol Circular.

MALNUTRITION

By PEARL MacDONALD

(Continued from Issue of April 2.)

The more common defects of children are adenoids, enlarged or diseased tonsils, decayed or abscessed teeth, eye or ear trouble. In what way do these defects interfere with normal growth?

Adenoids are quite common among young children. They are bunches of tissue that form in the nasal passages, usually just above the palate. They close up, entirely or in part, the nasal passage thru which the air passes to the lungs. When the child with adenoids tries to breathe thru the nose, it is too hard work, so he does not get as much air into his lungs as he needs. Because of this lack of oxygen in his lungs his body does not make the best use of the food which he eats, consequently his health becomes impaired. A child who has adenoids is invariably underweight.

Usually a child who has adenoids does not try to breathe thru its nose. Thus it becomes very susceptible to taking colds because of the irritation caused by inhaling dust and cold air directly into the lungs without having it sifted and warmed by going thru the nasal passages, which are provided with corrugations for heating the air, and with fine hairs for catching the dust. Enlarged tonsils are also harmful to health of the child, because they also interfere with proper breathing, and thus cause malnutrition, just as adenoids do.

Diseased tonsils form poisons which are carried by the blood all over the body. These poisons lower the efficiency of the blood by destroying the corpuscles, and thus lessen power of the body to resist disease. Diseased tonsils invariably result in under-nourishment and underweight.

Ear and eye trouble appear in various forms. Eye nerve strain will cause under-nutrition.

Decayed teeth afford places for harmful bacteria to develop. The mouth is the beginning of the digestive tract, and any poisons formed by the action of bacteria in decayed teeth will interfere with digestion

Recognizing Malnutrition

The question which the parent wishes to decide is whether or not a child is suffering from malnutrition, and if it is how to correct the trouble.

The appearance of the child will help much—the color, the brightness of the eyes, condition of the skin, etc. One of the best indicators is the weight of the child. For its height a child should have a certain weight. Weight per age cannot be taken as a standard because some children are small for their age, while others are tall.

By means of the study of many children a table of approximate weights per heights has been worked out by experts. While the tables so far worked out are probably not perfect, because all of this investigation is comparatively new, yet they serve as a reasonably accurate guide.

Following are the height and weight tables for boys and girls prepared by Dr. Thomas D. Wood, and issued by the U. S. Bureau of Education. The standard on normal weight is found where the horizontal column crosses the vertical column under the age. For example, the weight for a boy 51 inches tall and 9 years old is 62 pounds.

If a child is seven to ten per cent under weight, this indicates that there is something very definitely not right about its physical condition. "It is not well with the child." The child may have some physical trouble that is interfering with its health, such as adenoids, or diseased tonsils, bad teeth or some other physical difficulty resulting from faulty habits of living. Or it may not be receiving the right kind and amount of food to meet its body's growing needs. Or the trouble may be a combination of some of these causes.

The first thing to do when you discover that your boy or girl is not weighing as much as it should for its age and height, according to the accompanying tables, is to take the child to a competent physician and

have a thorough examination. Insist on a thorough examination. If there is any physical trouble, set about having it corrected at once. A child simply cannot grow as it should if, for example, his breathing is not right because his nasal passages are obstructed with adenoids, or if diseased tonsils or teeth are constantly forming poisons and discharging them into its system to be carried all thru the body. He cannot grow if some part of his body machinery is not working as it should.

Get the child interested in helping to maintain its own health. Every boy and girl wants to be strong and healthy. At least every boy wants to be strong and every girl wants to have the rosy cheeks that come with good health and a well nourished body. If approached in the right way every child will be willing to play the health game, that is, to see which one of the family can make the best "weight for its height" record each month.

To keep up to standard, the child will have to go to bed and get up at regular hours and get plenty of good sound sleep every night, with the windows open so that there will be plenty of fresh air in the sleeping rooms all night. If your child is much under weight, and is easily made tired and nervous, better keep it out of school for half a day or all day, and see that it has a rest period in the middle of each forenoon and afternoon until there is decided improvement. To build up a strong body is more important than school, and since it is not normally well, it is a waste of effort to send it to school in poor physical condition. The child will easily make up lost school work when it becomes strong and well.

SHOE COMFORT AND ECONOMY

With hides worth less than the cost of skinning the animal that wears them while shoes still sell for war prices, it certainly behooves farm women to consider the question of shoe economy.

For several years I have worn canvas shoes, in tennis style, for all kinds of housework summer and winter. I can do many times the work in comparative comfort that I could possibly accomplish if I wore leather shoes with high heels. My health is far better in every way than it would otherwise be, too.

The idea of paying the top-notch price for an ultra-fashionable shoe bearing the stamp of an exclusive maker is nothing short of idiotic and it is done by working people who can no more afford such extravagance than I can afford an aeroplane. People think if a shoe costs \$10 it must be far better than one that costs \$5 though many times an expert couldn't detect a particle of difference between the two. By the way, I have taken lots of comfort in a pair of shoes that cost 98 cents while other people were paying ten times as much, and the shoes were often admired by my well-to-do friends too. They were selected from a lot of odds and ends of discontinued styles that were marked down for those reasons and if one will use just a bit of common sense such a pair will prove just as satisfactory.

Of course no one likes to appear conspicuously "dowdyish" (and no one hates to worse than I do) but it isn't at all necessary, and if every one felt as I do about these things we would remedy the condition that makes \$10 shoes out of worthless hides if it meant going barefoot till prices of shoes come down.—E. M. A.

Weights and measures should be taken without shoes and in usual indoor clothes.

TIME TO CLEAN UP

By Hilda Richmond

Making surveys is such a popular thing nowadays that even the busiest men and women on the farms are beginning to think, perhaps, it is well to "stand off and look at themselves," as the Irish gentleman put it, to see if new ways and new thoughts cannot lighten farm work and sweeten farm life.

But while surveying the situation from all angles, do not forget that the question of health comes first. To be sure it is too bad if the farm house is shabby for want of paint, and the garden fence is sagging, but first of all the health of the family should be safeguarded. During the war many trees were permitted to go untrimmed for lack of time, and mossy roofs are in evidence where once the sun shone full and free on the homestead. No blame attaches to the farmer who was working with night and main to help save the nation at the call of his government, but now that the war is over the trees need attention. Mossy roofs not only decay the shingles, but they breed disease and should be made impossible by judicious trimming of trees or removal if nothing else will answer.

Then there is the question of drainage that suffered during hostilities. It is time that damp cellars should be looked into and oozy backyards be drained. The health of the family depends upon light and air under the house as well as in it, and there should be a good smell in the cellar that is never possible if water accumulates there.

The disposal of garbage is another important matter. If waste matter accumulates, disease follows. A good big bonfire is needed about many premises, followed by burying all such refuse as will not be burned in the fire. Rats harbor in weed-grown brush piles and destroy hundreds of dollars worth of grain, grain sacks and young chickens, while destructive fires in fall often have their origin in these neglected heaps. On a clear, still, hot day in spring clean up all the unsightly heaps and enjoy better health following the wholesale destructive of rat refuges.

Having cleaned the premises and made sure that the family water supply for both man and beast is safe and healthful, it is well to turn the attention to the house itself. Has a patient died of contagious disease and thoro renovation been impossible during the past winter? Tear off the paper from the walls and burn it speedily. Clean the woodwork and throw open the windows to the sunlight. Be sure that all furniture and hangings and bedding are made sanitary and destroy every lurking germ. If a room is damp and musty keep it open until it is fresh and wholesome if it is the sacred parlor, for one musty, unwholesome room in the house can contaminate others.

With the basement dry and white-washed, screen windows to admit air and keep out flies, the trees trimmed to let in the sunshine and the whole house so thoroly cleaned that germs will find no place to lurk. Much of the illness that has preyed upon the inhabitants of America following the great war can be routed. Hurry, worry, anxiety, lack of nourishing food, impure water, surroundings that are not sanitary, these have increased the list of deaths that could have been prevented under normal conditions.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3536—3539. — Pretty Afternoon Frock.—The waist is cut in 7 sizes, 34, 36, 38, 40, 42, 44 and 46 inches bust measure. The skirt is cut in 6 sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. 1 1/2 yards at its lower edge. A medium size will require 8 1/2 yards of 36-inch material for tunic, waist and skirt of one material, with 1/2 yard of contrasting material for collar and cuffs. Figured foulard, is the material. This illustration calls for two separate patterns, which cost 10 cents each.

3544—3541.—A Smart Costume.—The skirt is a new circular model cut in 6 sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. It may be cut with or without a center front seam. Without the center front seam a 26-inch requires 2 1/2 yards of 43-inch material if cut crosswise of the goods, and 2 3/4 yards if cut lengthwise of 54-inch material. Cut with center front and back seam and straight at the front edge, it will require 2 1/2 yards of 54-inch material. With bias edges 2 1/2 yards will be required. The blouse is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure, and requires 3 1/2 yards of 27-inch material for a 38-inch size. Sports satin, silk, flannel, crepe de chine, serge, ratine and linen are good materials. The width of the skirt at the foot is 2 3/4 yards. This illustration calls for two separate patterns, which cost 10 cents each.

3551.—Very Attractive Dress.—It is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size will require 5 1/2 yards of 44-inch material. The width at the foot is about 2 yards. This style is attractive for silk, satin, linen, gingham, chambray, foulard or challie. Pattern, 10 cents.

3552.—Smart New Gown.—The pattern is cut in 3 sizes: 16, 18 and 20 years. An 18-year size will require 6 yards of 38-inch material. This design shows the new long shoulder, and has very attractive lines. The width of the skirt at the foot with plaits extended is about 2 1/2 yards. Pattern, 10 cents.

Making up for lost time does not restore it.

Your partner in cooking

You'll find cooking success more certain with a Beechwood Range. It's always under control. It never balks, never has to be coaxed. A Beechwood is absolutely dependable. That's a big help toward a successful meal.

Beechwood Ranges are fitted with a Duplex Grate that in one turn rakes the fire and exposes the live coals at bottom for immediate cooking. Special constructions save coal and give more heat.

You'll want an enameled Beechwood Range for its cleanliness and attractiveness. The glistening sides never discolor, crack, craze or chip and are easily kept spotless. The polished top will shine with a few rubs of an oiled cloth. Three colors, brown, blue and gray.

Our folder will interest you. Write for it.

Green Mountain SILOS

STABILITY COUNTS

Your Green Mountain Silo, with the popular hip roof, will never need an apology. It is built to stand up permanently—just as any other farm building is expected to do. Every groove and joint is made to fit tight—both for permanence and silage protection. Every stave is treated in creosote preservative. Hoops are of extra heavy steel with rolled (not cut) threads. They cost us more but they stand unusual strains. Doors fit like a glove—always tight. Wooden ladder rungs; no iron to frost the fingers. Green Mountain Anchorage system holds silo absolutely firm and upright. A beautiful silo—with nut-brown side walls and bright red cedar roof. Write today for detailed circulars. Special inducements for early orders.

CREAMERY PACKAGE MFG. CO.
345 WEST STREET, RUTLAND, VT.

Will It Stand? YES

CRAINE TRIPLE WALL SILOS

Giants in Strength

When you build a new silo or rebuild your old one, make it a Craine, the strongest as well as the most economical made. Its three wall construction gives perfect silage protection. Outside the wall of upright staves is an air-tight, water-proof, frost-defying inner wall of Silafix. Outside of both is the spiral Crainolox covering, of giant strength—no hoops, no lugs, no weak spots, no repairs, but permanent protection for every inch of wall.

By rebuilding your old silo into a Craine, you save half the cost of a new silo. Ask us to tell you how. Literature and terms on request. Write also for agency proposition.

Feed Market Review

By SANDERS SOSLAND

AS FEEDSTUFFS values extend their downward readjustment, the consuming trade seemingly becomes more pronounced in its bearish attitude. Declines tend to darken or obscure the bullish influences operating in a market. For this reason, the consumer of feeds may question with more or less suspicion the suggestion that some commodities may be bought on a generous scale for deferred requirements. Not all feedstuffs can be classified as cheap enough and on a favorable basis for accumulation of stocks; a majority, in fact, must yet reach their bottom. However, there are important feeds which reflect a healthy tone around the current price levels and which may be bought and laid away for later needs with the promise of proving a profitable investment.

Cottonseed cake and meal, though outwardly reflecting an easy tone, display some distinct signs of underlying strength. Prices on the high

Phoebe D of Mapelawn 24205, the Oldest Cow of the Guernsey Breed to Complete an Advanced Register Record

protein product are at the lowest level for the entire crop year and the lowest in any recent year. Early on the crop cake and meal of 43 per cent protein content were selling around \$65 a ton in Texas, the most important producing state, and a few months previous had sold up to \$85 a ton. The market has declined almost without interruption, and now is down to a basis of about \$20 a ton in Texas, \$22.50 to \$23 a ton in Oklahoma, and about \$23.50 to \$24 in Arkansas territory. Pennsylvania and other Eastern states draw largely from Arkansas and other southeastern producing sections. Not since September of 1914, during the panicky period in the cotton market, have cake and meal sold at lower levels than now prevail, having declined to around \$18.50 in Texas at that time. In April of 1911, cake and meal of 41 per cent protein content declined to around \$20 a ton in Oklahoma, then a new low level, but values were maintained for only a very brief period on this figure.

Thus it is apparent that the high protein feeds are cheap in comparison with war-time and pre-war mar-

kets. Cake and meal also are cheap on the basis of relative feeding value, no feed being available in commercial channels offering protein units at as cheap a price as cottonseed products. Despite this, it is easily within the range of possibilities to witness still further declines in prices.

Among the influences contributing to the belief that the market is now around bottom are the sharp reduction in the operations of crushing plants, the comparatively liberal feeding demand in the Middle West, Central States, and broadening interest among dairymen of the East and on the part of export operators. It is not unusual at this season for cottonseed crushing plants to reduce their activities. This year, or at least in recent months, the extremely light demand for cottonseed oil, the principal product of the plants, and the resulting large accumulation of stocks, have forced a material cur-

off, being extremely light already.

Bullish price theories do not hold well on linseed cake and meal and other protein feeds. Instead, the position of the market is entirely favorable for a downward readjustment in price, the flaxseed product being at a relatively high level. Crushers in Minneapolis quote linseed meal around \$39 to \$40 a ton, and the cake is selling at Eastern export points around \$45 a ton. Within the past few weeks the market has fallen about \$3 a ton, but previously there was a rally of about \$8 a ton from the low point. Liberal buying of linseed cake by foreign countries, including Scandinavian and Holland, also Great Britain, together with light production by mills of the Northwest and East, contributed to the strengthening of values. Domestic demand for both cake and meal is of moderate proportions, but of a hand-to-mouth character, and the market is entering a season of the year when buying shows a rather sharp falling off ordinarily. Even the foreign demand is usually satisfied by the middle of April, and there is evidently already that export buying will be greatly reduced. At the same time the situation is more favorable as regards production by crushing plants. Seasonal demand for linseed oil, the principal product of flaxseed mills, is making itself felt in trade circles, and accumulated stocks of oil are being worked off, which are permitting increased activity of mills. The fact that linseed feed represents a delivered cost of at least \$45 a ton to Middle West consumers and to the Eastern trade, while cottonseed cake and meal can be delivered around \$30 to \$35 and corn below \$20 a ton in the most important consumptive channels, makes for reluctance on the part of domestic feeds and is being reflected in a smaller demand.

Another sharp setback having been recorded in prices, bran and shorts are now selling on a more attractive basis for feeders than at any time in the past four years. Bran can be bought around \$16 a ton in Kansas City and \$16 to \$17 a ton in Minneapolis, the two principal milling markets of the country, and on a basis of about \$19 a ton in St. Louis and Chicago. Delivered prices in the East are generally below \$30 and down to \$26 a ton at some Pennsylvania points. Gray shorts or flour middlings are holding around \$22 a ton in Minneapolis, \$20 in Kansas City and \$22.50 to \$23 in St. Louis and Chicago. Both mill offals are \$3 to \$4 a ton lower than at this time a month ago.

Considerable doubt prevails as to whether bran and shorts are now around bottom. Based on previous market performances, this is the season of high prices, continuing as a rule thru most of May, with a break following near the close of the crop year. However, the seasonal trend almost from the opening of the crop year is ordinarily upward; this year values have moved consistently downward. Current prices for bran are ridiculously cheap compared with a year ago, when the light mill offal was bringing \$55 to \$60 a ton on Middle West markets and shorts about \$60 to \$65 a ton. The best market judgment today is that both bran and shorts are low enough for the present and possibly until the opening of June, but that, without an unfavorable turn in the weather and crop situation, a somewhat lower level is probable by the time the new crop years opens.

McCormick Deering Milwaukee

Now—as to Harvest Time!

THE BINDERS of the nation must come out at harvest time and transform a billowing acreage into a great stubble field ready for the plow. This is a necessity of the near future and every individual farmer must be ready with men and machines to save all the yield of his own fields. Will your present equipment do the right thing for you? We call to your attention the standard binders of the nation.

McCormick · Deering · Milwaukee

are time-tried names, favorably known wherever there is agriculture. Grain binders with these familiar names will demonstrate again that nearly ninety years of harvesting machine development and satisfactory service in the fields of the world stand behind them.

Timely repairs may be your solution for this harvest, but to limp through the season with machines that are truly outworn will prove disastrous. No farmer can afford to run a binder that has served too many years, nor can he practice true economy with a small, inadequate machine if his acreage and power equipment demand an 8-foot binder.

As harvest time approaches, take careful account of your equipment needs, then see the International dealer. He has McCormick, Deering and Milwaukee—the binders that are guarantees of high quality and operating efficiency.

Please Mention Pennsylvania Farmer When Writing to Advertisers

TALKS WITH THE BOYS

TOM HEADS UP-STREAM

"Well, Tom, are you still working in the shops and getting those big pay checks that you told me about a year ago?" This question was addressed by the writer to a young farmer in one of the counties in the iron and coal section of southeastern Pennsylvania. He was a member of a Purebred Pig Club, but under pressure of attractive wages in a nearby shop, the operations of the farm had been reduced to what the father could do himself and the boys had gone to work under the call of the big whistle. Tom had, however, not left entirely from the farm. The shop was only a mile or so from the farm and he lived at home and went on with the breeding of his Poland China hogs. Tom's reply was that work has become slack and he was laid off and was now back in high school, planning to complete his work there. Tom is to be congratulated; he had been going along with the current of easy money and we didn't blame him. But this came to an end and he had the choice of drifting to the side of the stream and getting no where or turning the prow of his boat up stream and rowing against the current. We believe

is by these young men who have become tired of the city job or business and are ready to invest any savings they may have accumulated in the farming game.

These movements are in accord with social and economical laws and in the end probably work out for the good of everybody concerned. At present, however, there are thousands of boys in the position that Tom found himself. They were partly thru high school and felt that duty called them to help, either in the military service, or if not old enough for that, in the production problems of the war. During this period of new experiences they have gotten away from the routine of study and they are now asking themselves whether it is worth while after all to go on with an education. The immediate outlook on the farm may not seem very bright; the bottom has fallen out of the farm prices and their fathers are discouraged.

Aren't we justified in recommending to these young fellows the same choice that Tom made? The value of thoro scientific training for the business of agriculture has never been so great as now. The young farmer who leaves the farm at 17 to go into the works, may, if he is an

for Tom's choice is that to follow it means new visions at every turn. We can't hope to have a successful and profitable agriculture unless a goodly number of our young men dream dreams and see visions of farming as a real life work, worthy of just as much effort in preparation as is needed for any business profession. The farmer with a college training is no longer a curiosity in the best farming communities. His value as a leader is fully recognized.—C. G. McBride, State Club Leader.

LETTERS FROM THE BOYS

Dear Editor—We live on a farm seven miles from Everett, Pa. I am going to school regularly and belong to a Boys' Liberty Bell Bird Club. I have birdhouses up for the birds. We have two horses, four cows, and chickens. I have some pet rabbits and a pet hen. I like to live on the farm and like to drive a team.—Gilchrist L. Hess, Bedford Co., Pa.

Dear Editor—I live in Saco, Bradford Co., on a farm of 115 acres. I am eleven years old and my birthday is the seventeenth of July. There are nineteen scholars in our school. We have two pigs, twelve cows, four calves and three horses. We also have an automobile.—Richard McMorran, Bradford Co., Pa.

Dear Editor—We live on a farm of forty acres in the western part of Adams Co., Pa. We have seven cows, four horses and mules and a great many chickens. I quit school recently.—Clare Dull, Adams Co., Pa.

Dear Editor—I live with my brother who works on a farm of 161 acres. He owns a large span of black horses named "Kit" and "Prince." He also has 15 cows which we milk. I like farming and am happy all the time. I go to church and Sunday school every Sunday and went fourteen Sundays without missing a one.—Donald York, Tioga Co., N. Y.

Dear Editor—I am ten years old and have lived on a farm all my life. Our school closed the last of March and I will be doing lots of things around the farm. I like to harrow and plow. My sister and I set twelve hens and I expect to get quite a number of chicks from them. Last year I had four bantams, two hens and two roosters. I sold one rooster and got 60 cents. My hens laid many eggs.—Abram A. Ruth, Montgomery Co., Pa.

Dear Editor—I am ten years old and am in the fourth grade in school which is about one mile from our home. I have four older brothers and have lots of chickens, pigs, cattle and hogs.—Paul R. Cronrath, Montgomery Co., Pa.

Dear Editor—I am fourteen years of age and live on a farm of 101 acres with my two brothers and sisters. I go to school and am in the seventh grade. We have three cows, five calves, two horses and thirty-five chickens. We also have a large orchard and thirty-five acres of woodland.

I do not trap much but I go hunting sometimes.—L. E. Shafer, Jefferson Co., Pa.

Coming Later

Billy: What are you drawing, Jim?
Jimmy: Why, a dog!
Billy: But where's its tail?
Jimmy: Oh, that's still in the ink bottle!—Boys' Life.

The greatest argument after all,

The Lieby Brothers of Schuylkill Co., Members of a Holstein Club

his choice was a wise one and that the same course could be wisely followed by thousands of young men in Pennsylvania right now.

The boy on the farm has not come in for his full share of consideration in the advice that is being handed out so freely these days, and yet he is a big factor in the agricultural development. Census statistics show that the average life of an American farmer on his farm is fifteen years. This means that each community has the problem of preparing to be successful farmers each year, on the average one-fifteenth as many young men as there are farms in the community.

When the movement of young men to and from the farms is carefully studied it shows some interesting angles. Unusual and intensified industrial development such as we have had in the past few years, always causes the number of farm boys leaving the farm for the industries to shoot up. There is also an interesting study as regards the drift at different ages. The period from 17 to 21 shows the greatest activity cityward, and when we get well into the twenties there is a considerable back current and a goodly percentage of the replacement of retiring farmers

The money value of every day in high school and college has been proven by careful study to be not less than ten dollars. Every indication points to lower prices for farm labor in the next few years and the farm boy should no longer hold back because of the high cost of replacing his labor on the farm. He should figure every day in school as productive labor.

The greatest argument after all,

PASSING EVENTS IN PICTURES

1—South Carolina woman making a small model of "Liddle Boy," President Harding's Alredale terrier.
2—Motorized Hay Wagon Derrick being loaded with hay baled right on the farm.
3—Europe's famous "Siamese Twins." They are joined from above the hips almost to the knee. One of them is a widow with a son eleven years old.

4—White turkeys which are being raised on an English farm, said to be more tasty and delicate in flavor than the common variety.
5—Here are \$1,000,000 worth of confiscated drugs—taken from Chinese opium dens and similar places.
6—San Francisco has a new fire-fighting tug. Note the large number of powerful streams

thrown at the same time from its many "monitors."
7—Donald W. Forsyth, of Mercersburg Academy, topping the bar in the pole vault.
8—Splendid view of the White House, Washington, D. C.
9—Newton Creek, N. J., is said to be yielding enormous quantities of fish. One day's catch by these fishermen filled a boat.

Order before small supply is exhausted from The Henry Field Seed Company, Shenandoah, Iowa, or direct from The Grower Who Guarantees. THE DEGRAFF FOOD COMPANY, DEGRAFF, OHIO.

EXPERIMENT STATIONS AS AN INVESTMENT

(Continued from Page 3).

himself to the new conditions in the agricultural industry and to meet the competition of farmers in other lands. In the long run, tariffs on agricultural imports will be a partial protection only to the American farmer. The best protection and the best assurance of success will be his growing efficiency, an efficiency that will enable him to hold his own under all conditions of fair competition. The American experiment stations are a necessary agent in the building of agricultural efficiency in America. That this fact is well recognized by our political leaders is shown by the efforts to secure thru Federal appropriations better support for the experiment stations in the several states. A bill now pending in Congress, designated as H. R. 15770, if enacted into law, would provide better support to the American experiment stations and is, for this reason, deserving of support by all men and women who are interested in the welfare of our agricultural industry.

THE OTHER SIDE

Don't you think that the farm papers have over-estimated the farmer's bad luck in the falling prices? Look at the merchants who have lost heavily, look at the large concerns which are almost ruined, look at the stock markets; we only see one side. The papers talk of how the merchants are robbing the people. I used to believe it but I do not now. The city wages are high, the rents in city are high, the merchant has to own or rent a house, and own or rent a business place; put the two together and how much does it represent? I guess more than the price of a farm. Then the merchant has to employ help; the help has to live somewhere. Their rent is high, because taxes are high, because gas or electric light is high, because water rent is high and these things are high because the means thru which they were obtained are high—that is, labor. The price of labor is at the bottom of it all; about 90 per cent of the farmer's expense is labor. Our fertilizer is high because the materials are gathered, shipped and handled by high-priced labor and the cars and vessels are built by high-priced labor. By the time the produce which we sell so cheap come on the tables of the restaurants, how many handlings has it had by high-priced labor?

Should we farmers like to live in the cities and have the so-called conveniences that the city enjoys? I think not.

Let us look at the young life in the cities. They have the movies and theatres, the parks—we have miles of beautiful parks. In the cities, if a young lady wishes to entertain she can go to the bakery and procure all the pastry needed for a good showing, and open canned goods from the grocery. In the country the young folks prepare for an entertainment by baking their pastry. They use fresh eggs of the present day's gathering—not the recanted varieties which you break each in a separate saucer. Their cake does not taste of the cornmeal variety as does the city cake. The country girl can go to the cellar and procure fresh apples and vegetables or to the pit in the garden in winter and get celery that is not tough and

stringy. The country lass can go to the organ or piano and entertain her company and does not have to hire the movie or the theatre to entertain for her.

The young folks of the country often gather at a friend's house for a good time, you can see the yard fairly packed with autos—no seven cent trolley there. Our blessings are at our feet if we only realized it.

I know we get discouraged (who does not?), but look at the records of some of the farms, having been in one family for three generations. In the city they say, that is an old firm if its business record runs about 60 or 70 years.

In the city it is a fact that three generations will close out nearly any family. Not so in the country; we have health, happiness and our share of wealth.

We know the farming game, so let us stick to it and not go to the city to be disappointed for very few who go there find the pot of gold that they thought they would find.—C. L. D., Burlington Co., N. J.

ERADICATING GOLDENROD

I have always thought we bought goldenrod seed with the timothy or clover seed we sowed one year; at any rate, there never had been any goldenrod on the field until that year when we seeded it down; then it came in "thick as spatter," and with a grip on the earth that well-nigh broke our backs pulling it. To make the matter worse, every root we broke made a lot of new plants. The roots pushed thru the soil in every direction, until little besides goldenrod was there to be harvested, a pretty poor crop and hard to handle.

For some time we tried to kill the weeds by cutting them "in season." That did not have much effect on them, however, and we came to the conclusion that some more effective way would have to be adopted. The way we took was that of summer fallowing and plowing every few weeks all thru the summer.

We turned the field under first in May, pulling every stalk we discovered and carrying it off the field so that it would not catch root and make new plants. Off and on after that till fall we plowed the field thoroughly, following up our original plan of pulling all plants which remained above ground.

By the time August came, the goldenrod began to get discouraged. Only a stalk here and there appeared. The field lay there that next winter, and the next spring we plowed it again and seeded it down with oats. That was the end of the goldenrod. That thorough cultivation had done its work and done it well.—E. L. V.

SHORT CUTS WITH THE CORN CROP

(Continued from Page 8).

is that for every bushel of corn "sold" hogs in the field last autumn they returned a price of \$1.40. Therefore whether we take the figures for 1919 or 1920 we must accept the fact that hogs if allowed to market a portion of our corn crop will pay approximately twice the market price at the same time relieving us of the two very expensive jobs of cutting and husking. The stalks are returned to earth and the manure is spread. Here is a short cut which among others is both practical and profitable and commends itself very strongly to the corn grower who also dabbles in hogs.

Aspirin

Always say "Bayer"

Unless you see the name "Bayer" on tablets, you are not getting genuine Aspirin prescribed by physicians for 21 years and proved safe by millions. Directions in Package. Aspirin is the trade mark of Bayer Manufacture of Monocetacidester of Salicylic Acid.

HORTICULTURE

STABLE MANURE FOR GARDEN

The home gardener who can get a load of well-rotted stable manure need not worry about fertilizer, as anyone who has ever done any gardening is well aware.

Manure contains humus in plenty and all the necessary plant materials, as well as bacteria which put these materials into the most usable shape for crops. To get the full benefit of stable manure, however, it should be balanced with acid phosphate, which is comparatively inexpensive.

An application of one ton of stable manure, which is about an average two-horse load, is not too much for a garden thirty by sixty feet, and fifty pounds of acid phosphate may be used with it.

Fresh stable manure should not be applied in the spring. It contains too much readily available nitrogen and may cause in some plants too great a growth of stems and leaves at the expense of the fruits. This is especially true of tomatoes.

In planning the garden, arrange the rows so that they will run north and south. In this way the sun will shine directly over the rows at noon, in the morning will hit the east side and in the afternoon the west side of the row. Where pole beans and sweet corn are to have a place in the garden they should be planted along the north side, so as not to shade small vegetables.

In digging the garden it is necessary to dip deep—the deeper, up to 10 inches, the better. You will give the plant roots just so much more of a chance to obtain plantfood and the soil will hold more water and act as a large reservoir for plant growth. As soon after digging as possible, rake and level, thus checking undue evaporation of water from the soil.

ACREAGE AND PRICES OF CANNED TOMATOES

The acreage of tomatoes for 1915-1919, the height of the war period, increased over three times what it was before the war. The government commandeered from 1917-1918 33 1-3 per cent of the entire pack, and in 1919 45 per cent of the canned pack. Thus, we more than tripled our acreage, and packed an immense quantity, some of which is still held in the government reserves, and the remainder in the can houses of the canners. No one knows how many tomatoes are still held by the government because of the inability to get rid of the supplies on hand. No one can forecast what the market will be. Judging from the amount the government bought, it appears as though they might have had almost a year's supply left for the entire country.

So long as these conditions exist the grower who studies his business will follow business methods in growing the crop. The cotton growers of the south, backed by the bankers, have announced their intention to reduce the cotton crop 30 per cent. If the New Jersey farmer follows the same practice as the U. S. Steel Corporation, the American Woolen Mills, the automobile manufacturer, he will likewise decrease his acreage of canned to form new plants.

house tomatoes materially.

The cost of growing an acre of tomatoes in 1921 has not decreased nearly so much as the price which the canner can afford to offer the farmer. In many localities there is almost no demand. Information from other tomato growing regions is to the effect that the canners are not in a position to buy or contract as they have in former years. The whole industry is still demoralized.

It requires conservative action on the part of the grower, as every individual must decide whether he should or should not grow the crop. This cannot be decided by anyone but himself. These facts, however, should be given the grower. He should know the conditions of his business before he makes his plans, as it is quite probable that the marginal profit on many things will be small this coming year.—Cumberland Co., N. J. Demonstration News.

THE CURRANT WORM

We should be on the lookout for the currant worm on all currant and gooseberry bushes, as they are pretty sure to appear on the lower branches of the bushes as soon as the leaves come out.

If they are not destroyed they will soon strip the bushes of their foliage and young fruit. I have used Bordeaux mixture with a little Paris green in it with success. If the worms are killed on all of the bushes it is not likely that there will be so many worms the next year. The spray is also a good remedy for the mildew on the bushes.

If the gooseberry bushes are neglected they are not only worthless but they are positively an injury to the community as breeders of pests.—A. J. L., Nicholas Co., W. Va.

MORE MONEY FROM MELONS

Melons sold by the Melon Growers' Association of Southeast Missouri last summer sold for \$50 to \$100 a car more than those sold by independent melon dealers. This association, formed last spring, saved the growers at least \$175,000 the first season.

Four hundred members formed the association last spring, and during the shipping season, shipped \$750,000 worth of melons. Many growers who were not in the association this last season have asked to be in it this year. Besides selling to advantage, this association can also spray, buy seed and machinery, and other equipment at a saving. Surely, it pays to co-operate.—E. A. K.

Locate the home vegetable garden as near the house as possible. Plan the garden early and put into it the vegetables which are particularly popular in your own home. Work out the garden plan carefully on paper before buying seeds.

Buckwheat is particularly valuable as a smother crop to use in eradicating witch grass. It is extensively used as an orchard cover crop, and is of value, also, for honey bees.

Spring prunings may be profitably

This is SOME Sprayer!
Sprays trees, shrubs, potatoes and field crops for insects and fungus; sprays stables, pig and poultry pens and barn yards for lice, vermin and for disinfecting. Also useful for whitewashing stables, poultry houses and fences. It's handy too, for washing windows, buggies and for spraying stock.

So if the question is viewed from the broad standpoint, consider the livestock in relation to the land, the livestock in relation to the people who live on the land, consider it from the standpoint of feeding, of breeding, from the standpoint of care and management, there exists no reason why this business will not be relatively more profitable than any other line of agriculture.

LAKE SHORE KENNELS, HIMROD, NEW YORK.
 Ter Fox, Coon and Rabbit Hounds and pups.
 Shipped on approval, you to be judge.

Small grains, being shallow rooted, are dependent on the surface soil for moisture. That makes it important that the seed bed be thoroly compacted to insure the normal capillary-rise of ground water. If it is possible to plow the ground for a small grain crop two weeks or more in advance of seeding, disk harrow it at once deeply and thoroly, and then harrow at several times at intervals with the smoothing harrow; the right kind of a seed bed may thus easily be prepared.

When Fertilizer Failed

Showing How One Man Learned the Cause of His Clover Failures

By HUGH FERGUS

JIM YOUNG was in a quandary. For the past four or five years his "catches" of clover had been getting poorer and by the time they had wintered they were still more uncertain. At the same time more and more each year of late he had been getting an undesirable crop of sheep sorrel and kindred weeds.

Jim kept enough livestock to consume all the roughage produced on his farm. In addition to returning this to the land by way of manure he had been applying just as much acid phosphate as ever but in spite of this fact not only had his yields of clover been getting decidedly less but he could see that his other crops had not of late years been keeping up to par.

He suspected that the trouble was lack of lime but he had been so busy with his hands the past few years, or ever since he had purchased his farm and was working to get paid off the heavy mortgage he had assumed, that he thought he had no time to use his head and think of lime, drainage, better stock and other such things.

But finally one evening last fall Jim had finished up his work a little early and as he pushed back his chair after just downing a piece of one of his wife Mary's puddings, he said, "Mary, I came across the wheat stubble this afternoon and, by George, if the clover doesn't look discouraging. Last spring I thought I would put on more seed and sowed six quarts per acre of that \$33 a bushel seed. It came up good and when we cut the wheat it still looked promising but today I noticed that some spots had died out entirely and plenty of other places in the field the clover is short and has a sickly yellow look. Frank Olds was telling me the other day that his seedling of clover never looked better and this year he had so much hay that his barn would not begin to hold it all. I believe I will go up and see Frank tonight and see if I cannot save what is left of my seedling."

"I am going along too," said Mary, "we have been so busy this past summer that it has been about nine months since we have had a visit with Jennie and Frank. I will hustle out and hitch up the horse and I will clear off the table and wash and get right away. Don't you worry, I had a flivver, Jim?"

"Yes," Jim said, regretfully as he started for the barn, "I don't think it would pay us to go in debt for one now though while prices are so high and the dollar is so cheap. We will use those cheap dollars we save to pay on the mortgage and buy the flivver when prices become normal again."

In due time the Youngs arrived at the Olds' home and after the usual pleasantries indulged in by friendly neighbors Jim got around to the object of his visit.

"Frank," he said, "of course you know more or less of our financial circumstances and how Mary and I have worked and saved these last few years in an effort to get the better of our mortgage, which I am glad to say we are succeeding in doing. During this time we have kept enough stock to use up all the roughage we grow on our farm besides the corn and oats as grain. All this we have been returning to the fields in the form of manure. At planting time we use acid phosphate with the grains. In spite of this, I suppose you have observed our grain crops do not seem to be increasing in yield the way they should and every year our clover crop is getting more and more uncertain. Today I walked across this year's seedling and in spite of the fact that it looked good at the time we cut the wheat the clover is already gone in some spots and certainly does not look too promising on the rest of the field."

"Now Frank," Jim continued, "during these same years I have noticed that every year your crops of everything are of the best and I have come up here tonight to see if you cannot give me some advice that will help me out."

"Why certainly Jim, I will if I can," said Frank heartily. "I think your trouble is lack of lime."

"When Jennie and I were starting out in life here together we went thru almost exactly the same experience you are going thru. We had gone heavily in debt for our farm, too, and were farming with what we thought was the most economy to make us the most money to get rid of our mortgage. Just as you are doing we fed up as much as possible of our crops on the farm and marketed them in the form of livestock. Only in those days we did not know so much about commercial fertilizer and did not use any. One summer when we had our farm about three-quarters paid for we had a complete failure of clover except in one spot in the field. The year before we had to replaster a couple of rooms in the old house and after the plasterer had finished we cleaned up all the old plaster and the lime we did not use and hauled it out and spread it on a small area of our new seedling. That small area was where we had the clover."

"Jennie," I said to my wife one day after we had cut the hay, "our clover was a failure this year except for one spot and that was the place we hauled the plaster and lime after we finished plastering those two rooms last summer. I believe it must have been the lime which caused the clover to grow for it certainly could not have been the hair and sand in the old plaster. Anyhow I am going to try to get out limestone and

"But to go on with my story. The next year after we took the wheat off we had almost a perfect field of clover and a bigger yield of hay than we ever had. That crop of clover gave me the lime fever and I have been using lime ever since. I learned a good many things about it too as I went along. After I had gotten over the fields once I thought the second time I applied it to a field I should use as much as I did the first time and as a consequence instead of the clover dying for lack of lime some of it died on account of too much lime. But in course of time I have found that after you have limed the fields the first time, the equivalent of one-half to three-quarters of a ton of lump lime per acre every four or five years is sufficient."

"Do you always apply the lime on the ground you are seeding to wheat?" Jim asked.

"No, I don't," Frank answered. "When I first started using it a number of years ago I tried to apply it to the ground I plowed for wheat in the fall before I did any harrowing. In case I could not do that I let it slake in the kiln and spread it on the wheat ground during the winter. This was almost as good for I used the manure spreader to scatter it with. I would fill the spreader as full as possible with straw, set it to run the smallest number of loads per acre so as to cover the ground quicker and then put in what lime I thought would spread the right amount per acre. The third best way if I didn't find time to do it either of the first two ways was to spread the slaked lime from the kiln with the manure spreader in the same manner during the next summer after the wheat was cut. And then if it so happened that I couldn't get it done that summer I would try to do it in the winter time."

"Well, after you applied the lime to a field the first time, when did you make your second application?" was Jim's next query.

"The proper place is on your corn ground after you plow it provided you are going to plow it the next year for oats instead of disking it. By applying it then the preparation of the ground for corn and the three or four workings the corn gets thru the summer thoroughly mixes it with the soil and I know from experience that it helps the yield of corn a little. By the time the ground is turned over for oats and back again for wheat the lime is mixed all thru the soil and in ideal shape for your clover crop."

"I notice you have been buying lime the last four or five years instead of burning it. Why are you doing that and what kind are you buying?"

"One reason I am buying is because I can hardly get labor enough for the regular farm work to say nothing of burning lime kilns. Another reason is because in the last few years a lot of companies have sprung into existence that either burn lime or sell ground limestone for agricultural purposes. These companies are located where there are thick veins of the stone that do not require much stripping. They are equipped with steam shovels with which to strip, compressed air drills to drill the holes for blasting and in every way are equipped to handle the stone so efficiently that I have been able to buy lime cheaper than I can burn it."

"Now in regard to the kind; I try to get the cheapest and the way to tell which is the cheapest is to compare the amount of actual calcium in each kind. For instance, 1100 pounds of lump or fresh burned lime, 1600 pounds of hydrated or slaked lime and a ton of ground limestone all have about the same amount of calcium in them. I just got quotations the other day at \$8.00 a ton for lump lime, \$10.00 a ton for ground hydrated lime in sacks, and \$5.75 a ton for ground limestone in sacks or \$2.00 less in bulk. At these values comparing the other two with the lump at \$8.00 the hydrated lime should cost \$5.50 per ton in bulk or \$7.50 in sacks (\$2.00 a ton less).

Indiana County, Pa., Farmers, Ages, 70 to 88 Years

Brimstone in the Fertilizer Industry

Sulphur Plays an Important Part in Our Agricultural and Industrial Activities

By Dr. J. G. LIPMAN

Director New Jersey Experiment Station

THERE is scarcely any chemical as important as is sulphuric acid in the industrial life of the United States. It is used extensively in the manufacture of explosives, petroleum products, dyes, ammonium sulphate, aluminum sulphate and a large number of chemical salts and of acids. If is used, above all, in the manufacture of acid phosphate, the most common of our fertilizer materials. It is estimated that our acid phosphate production in 1920 was about 4,500,000 short tons. But since one ton of commercial acid and one ton of phosphate rock are required to make two tons of acid phosphate, it follows that approximately 2,250,000 tons of acid were used in 1920 in our acid phosphate plants. Aside from the manufacture of acid phosphate, sulphuric acid is used largely also in the production of ammonium sulphate, another of our important fertilizers. In view of these facts the readers of the Pennsylvania Farmer will no doubt be interested in a short account of the past and present supply of sulphuric acid and particularly of the importance of sulphur (brimstone) for its manufacture.

The following table, taken from a recent bulletin by Wells and Fogg, shows the growth by ten year periods of the sulphuric acid industry in the United States since 1870.

1870—105,000 tons	1900—1,600,000 tons
1880—425,000 tons	1910—2,700,000 tons
1890—765,000 tons	1920—7,500,000 tons

It will be observed that since 1910 the annual production has practically trebled, a fact partly attributable to the war and partly to the normal growth of the fertilizer industry. In 1918 the demand for sulphuric acid in the making of explosives was at its highest point, hence it may not be amiss to show here how the acid was used in the different industries in 1918. In the following table drugs and ammonium sulphate are included under the heading Chemicals. The amount given for steel pickling also includes that used for galvanizing. The amount quoted under Paints includes that used in the manufacture of lithophone and glue. In the ever increasing importance of the storage battery industry the use of acids in that field is gradually becoming greater and while the amount listed under the heading of Metallurgical does not seem large prospects are that it will be greatly increased.

The demand for the acid to be used in the manufacture of explosives is at present less than when this table was compiled.

Name of Industry.	Tons per year.	Per cent of total.
Explosives	2,700,000	36.0
Fertilizers	2,130,000	28.4
Oil refineries	671,000	8.8
Chemicals	740,000	9.9
Steel pickling	700,000	9.3
Fabrics, textiles, etc.	100,000	1.3
Paints	104,000	1.4
Metallurgical	292,000	3.9
Miscellaneous	73,000	1.0

Total 7,510,000 100
Despite the temporary check, due to the general business depression, the fertilizer industry is bound to grow steadily. In normal years the cotton belt will consume nearly four million tons of commercial fertilizer. The Middle West and the Farther West are rapidly learning to appreciate the value of available phosphates in placing crop production on a more profitable basis. As a result of this the demand for sulphuric acid will also increase, even though the newer methods for making available phosphates without the use of sulphuric acid may become prominent.

Sulphuric acid is made from brimstone, from iron, copper and zinc materials containing sulphur, and from fumes and gases derived from smelters and gas works. From the middle of the last century to the early eighties brimstone was the principal raw material for the making of sul-

phuric acid. In 1882 about 85 per cent of the acid used in the United States was made from brimstone which was imported into this country from Sicily. At the beginning of the present century a mineral known as iron pyrite and imported in large quantities from Spain (Spanish pyrite) began to play an important role in the sulphuric acid industry. In fact, it practically displaced the Sicilian brimstone. By-product acid also became an important source of this material, thanks to the recovery of sulphur fumes from 1895 on at the zinc smelters in Illinois and the copper smelters in Tennessee. At the beginning of the war about 50 per cent of our sulphuric acid was made from Spanish pyrite and only 2.6 per cent from brimstone. Since that time, and under the stress of war conditions, new plants were built to utilize brimstone rather than pyrite, and many of the old plants were remodelled likewise to use brimstone. Thus in 1917 the production of brimstone acid equalled 32.6 per cent of the total output, while Spanish pyrite was used for the making of 22.9 per cent of the total output. A year later the use of Spanish pyrite was still further restricted, namely to 7.6 per cent of the total acid produced, while brimstone was made to contribute 48 per cent of the raw material.

Deposits of brimstone have been located in many places. It is found on the island of Sicily,

phur near Lake Charles, Louisiana, in 1865. Other deposits have been discovered since that time, the most easterly of them at Belle Isle, Louisiana, and the most westerly in Matagorda County, Texas or a distance between the two points of 225 miles.

There are at present three companies engaged in the mining of sulphur by the Frasch or modified Frasch process. They are the Union Sulphur Company, of Louisiana, and the Freeport Sulphur Company and the Texas Gulf Sulphur Company, both located in Texas. Of the three big sulphur companies in the United States, the Union Sulphur Company is the oldest. Beginning production on a large scale in 1902, it was already producing at the rate of 200,000 long tons in 1905. At that time the demand for sulphur was rather limited and the accumulation of large stocks above ground was the result. In 1917 the stocks above ground were equal to about 800,000 long tons, and the production capacity was 2000 tons a day. This capacity was increased to 4000 tons a day during the war and there was accumulated a large reserve of sulphur above ground, estimated at 1,000,000 tons. It is reported by the Bureau of Mines that for an average daily production of 2000 tons a day there are required 4000 barrels of fuel oil and the labor of 800 men. During each 24 hours there are pumped and heated 8,000,000 gallons of water.

The Freeport Sulphur Company began operations in 1913, and by 1917 developed a production capacity of 1500 tons per day. Its sulphur

bearing property is located within three miles of the coast. Mining is carried on over an area of about 520 acres. During the first half of 1918 it was mining crude sulphur at a cost of \$6.15 per ton, whereas the Union Sulphur Company was producing sulphur at that time at 40 to 50 cents less per ton.

The Texas Gulf Sulphur Company controls a rather large area of rich sulphur ore. Actual production was begun only in 1919, nevertheless a large production capacity has already been developed, and the amount of sulphur produced in 1920 is reported to have been larger than that of any other company. It is also reported that the daily production has expanded to 3000-4000 tons a day, and that the total deposit of sulphur is greater than 10,000,000 tons.

When the Texas Gulf Sulphur Company began operations in 1919, the Union Sulphur and the Freeport Sulphur Companies had on hand, above ground, nearly 1,500,000 tons. The normal consumption in the United States had been but 400,000 to 500,000 tons. It was felt, therefore, that there was need for creating new markets for the material. This was accomplished, in part, by displacing Spanish pyrite formerly used in large quantities for the production of sulphuric acid. Now the fertilizer trade is using brimstone acid to a large extent. The rubber and paper pulp industries have also increased their requirements until in 1920 the market absorbed about 1,000,000 tons of brimstone. A still larger market will be developed in time thanks to the use of inoculated sulphur for controlling potato scab and other fungus diseases; for supplying this constituent to crops like alfalfa and clover in Oregon, Idaho, Washington, Northern California; the production of soluble phosphates; the eradication of noxious weeds; the reclamation of certain alkali soils, etc. The development of very vigorous strains of sulphur bacteria by the writer and his associates, and their discovery of practical methods for the inoculation of sulphur on a large scale offer promise of a very material increase in the demand for brimstone and of its successful use for increasing crop production.

The use of manure on small grains results in lodging so frequently that it is better practice to use manure on some other crop and depend upon commercial fertilizers for the small grain crop.

Ready For a Frolic

Entered as second-class matter at the postoffice at Philadelphia, Pa., under the act of March 3, 1879.

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.
—The Editors

Our Deeds shall travel with us from afar,
And what we have been makes us what we are.
—George Eliot.

Vocational Schools

ONE of the most interesting and instructive trips the writer has made in many a day was a tour of Chester, Lancaster and Perry Counties, Pennsylvania, visiting vocational schools in company with the state director of this work, Prof. L. H. Dennis. While we have had some knowledge of and a great interest in these schools we found we had small conception of the valuable work they are doing in the communities in which they are established. Later, we shall publish some account of the schools we visited so that others who do not have detailed knowledge of vocational schools may know what is possible and be induced to establish them in their neighborhoods. Incidentally we feel it right to publicly commend the work and ability of Prof. Dennis. Without doubt, he is the right man in the right place.

Reduce the Freight Rates

REPRESENTATIVES of the Farmers' Union, together with other members of the National Board of Farm Organizations appeared before the Interstate Commerce Commission last week and made an earnest plea for lower freight rates. The delegation represented every part of the United States and the unanimous testimony was that the present rates are prohibitive in many respects; that owing to the present low prices many articles of produce do not bring enough to pay for the transportation. Representatives from the South and West told of the stagnation of marketing because it did not pay to ship hay, grain and some kinds of vegetables, and those from the Pacific Coast said that immense quantities of fruit had gone to waste for the same reason. One representative told an instance of a shipment of cabbage which sold in Texas for \$6 per ton. The freight to New York was \$32 per ton and the cabbage was retailed there at \$130 per ton.

John A. McSparran, Master of Pennsylvania State Grange, argued that the present rates were not only excessively burdensome to the shipper but they operated to decrease the income of the railroads themselves. He said that in the East where short hauls were the rule the competition of motor truck lines had greatly reduced the income of railroads because the cost of shipping by truck was less.

None of the representatives contended that the reduction of rates would of itself remedy the present economic condition of agriculture but it would be a start in the direction of a general

Pennsylvania Farmer

reduction of inflated conditions; that the psychological effect would be to encourage farmers to believe that an honest effort was being made to lower all costs to a reasonable basis. Congressman Wingo of Arkansas said that the great American game today is "passing the buck".

Effort after effort had been pretended and investigation after investigation had been made but in every instance they came to naught because every man and every industry simply "passed the buck" to somebody else. In this instance the railroads say they cannot reduce rates until wages are reduced and labor says it cannot accept less until rates are reduced. The same process of arguing in a circle is found in the steel, iron and coal industries but it is getting no place and is the cause of the present stagnation in business. The farmers at this conference put up a plain straight demand that this foolishness stop and that governmental agencies which were instituted and are supported for the purpose of serving the public in such instances shall begin at once to function in relation to big business as they have in regard to agriculture.

The representatives at this conference also had a hearing on the same subject with the President and asked that the government take summary action to bring to a common basis the deflating processes, and we look for something to be done in this direction. This meeting was another example of the need and the value of the Board of Farm Organizations. There has been sufficient evidence to prove to all reasonable farmers that there is a necessity for a national organization federating all the farmers' organizations of the country.

Signs of Betterment

THERE ARE encouraging signs of social and moral betterment and a return to "normalcy", in some communities at least. This is evidenced by the protests made against so-called "liberal" ideas concerning Sunday observance, amusements, social practices, etc. In many places there seems to be an increased interest in church services and Sunday Schools.

For the past five years the general lowering of the moral tone of the public has given the lawless and the loud-mouthed protestant against restraint encouragement to take and demand more freedom than society in its normal state will allow. The demand of this class for a repeal of what they call "The blue laws" has been most persistent, but up to this time they have not been able to repeal or enact anything that would injure the social structure, and, what is still better, their activities have tended to arouse the sleeping conscience of the better element of society into energetic opposition to their proposals. We have never believed that humanity was going to the everlasting how-woos in any wholesale manner, because the native good sense of mankind usually responds in time to save the race. We will not have any recurrence of the dark ages.

Health on the Farm

SINCE 1900 there has been a gradual decrease in the number of deaths from typhoid fever in the large cities, while during the same period there has been little if any decrease in the death rate from that disease in the country districts. That fact may be surprising to those who have always looked upon typhoid fever as a disease of the populous centers, one which swept thru the cities and large towns taking its toll of human lives but left the most of the country dwellers untouched.

The normal human being values his life very highly but is singularly indifferent when it comes to doing anything to preserve the usefulness of his body or to protect himself from disease. The city man is provided with traffic police to help him get across busy streets but even then he will often risk his life in a mad dash thru the traffic, when if he would wait a few moments for the police to stop the stream of street cars and automobiles, he could cross in safety with other pedestrians. He is in too much of a hurry to spare a half minute to keep himself from great danger but once on the other side he can stop for five minutes to look in shop windows or visit a friend. The average farmer will abuse his own body

and treat himself generally in a way in which he would not allow his horses to be treated.

Few people will take care of themselves unless they are forced to do so. Coal miners cannot be trusted to avoid great risks and the foremen and superintendents have to watch constantly to make them be careful with their own lives. It is probably this queer trait of human nature that accounts in a large part for the decrease in the death rate from disease in the cities without a corresponding decrease in the country. City people are forced to live up to certain standards of sanitation and they are taxed to pay for the provision of good water and adequate sewage disposal systems. Country families must each solve their own sanitation problems and too often these problems are neglected or forgotten.

Spring is a good time to raise one's valuation on his own life and that of the other members of his family and to begin a program of cleaning up the fly breeding places, drying up the damp spots and brightening with sunshine the dark corners in and around the home. There is no reason why the farm home should not be the most healthful place on earth. It has every advantage and a little care and a little extra work will make the country home the ideal health resort unexcelled by any cabin in the mountains or cottage by the sea.

Human life is too valuable to be wasted and the American farmer cannot afford to overlook the danger of disease from open "kitchen drains", and from improper care of his own body, or of accident due to carelessness or foolish trust in a farm animal that "was never known to be ugly". The man who knows that flies carry disease but does nothing to prevent their breeding and who is careless with his own life and the lives of his relatives and neighbors might well be put in the class with those two famous gentlemen, the one who rocked the boat and the one who didn't know it was loaded.

New Jersey's New Laws

THE REPRESENTATIVES of New Jersey farmers' organizations were evidently on the job during the sessions of the Legislature as evidenced by the results obtained. Some of their activities are indicated by the following results:

The bill providing for the prevention of the use of coconut fat in milk, introduced by Assemblyman Sexsmith, of Monmouth, was one of the most hotly contested bills in the Legislature this session. The coconut oil interests employed an able lobby to prevent its passage, and it was opposed by some of the strongest political figures in the state. The State Federation of County Boards of Agriculture, with the co-operation of the Grange, the Dairymen's League, the State Chamber of Commerce and the Women's Federated Clubs worked for its passage.

The ice cream bill, which fixes a minimum butterfat content of eight per cent for commercial ice cream, was introduced by the State Department of Health, and was supported by the Federation, the Grange and the dairy interests.

The Daylight Saving bill, which was strongly opposed by all agricultural interests, passed the House but met with such opposition in the Senate that it was not brought to a vote.

The Rural Police bill, which was strongly urged by the farmers, the State Chamber of Commerce and other bodies, and was opposed by organized labor, was passed over the Governor's veto.

Our Washington Letter

O. E. Bradfute of Xenia, Ohio, Chester H. Gray, of Nevada, Mo., and W. H. Hill, of South Dakota, representing the American Farm Bureau Federation, called upon President Harding, and requested him to appoint a farmer or a farmer-minded man on the Interstate Commerce Commission. The President told them that the appointment would be eminently satisfactory to the American Farm Bureau Federation and therefore to the farmers.

Mr. Bradfute asked that the farmers be represented on the Federal Reserve Board, the Shipping Board and other boards and commissions, by the appointment of one farmer member to each board. President Harding replied that he had already committed himself in favor of recognizing agriculture in making these appointments.

A permanent organization of the National Union of Farm Loan Associations was completed

Pennsylvania Farmer

at a meeting in Washington April 20, with M. Elwood Gates of California, president; Cyrus H. Good, of Pennsylvania, vice president, and W. W. Flanagan, of Washington, general agent. In an address before the delegates from farm loan associations thruout the country, Senator John W. Fletcher, of Florida, declared there is no safer investment in the nation than farm loan bonds. He pointed out the necessity for organizing the national union, warning the delegates that they must be on their guard against attempts to weaken the Federal Farm Loan act. Twenty-five amendments have been offered recently and more will be offered, each one of which is liable to contain a joker that will nullify the provisions of the law. He accused the Farm Loan Board with having attempted to "bluff" the farm loan associations into refraining from aiding the national union, and said he thought the board was making a serious mistake in its attitude toward the loan associations. In answer to the alleged threat of the Farm Loan Board to remove the charter of farm loan associations that contributed to the support of the national organization, Senator Fletcher quoted the law showing that only when an association has become insolvent to the extent of \$150,000 can its charter be taken away from it. William G. McAdoo, former Secretary of the Treasury. In a telegram, said that owing to the fact that the Farm Loan act is in danger of hostile legislation, friends of the farm loan associations were wise to organize to protect the system and extend its usefulness.

A forceful address was made at the opening of the N. B. F. O. meeting recently held in Washington, by John F. McSparran, master of Pennsylvania State Grange, who said the farmer is today a business man with certain things to sell and certain things to buy. He opposed the removal of the surtax and excess profits tax, and referred to the cost plus system that developed during the war as one of the most damnable things in the nation. The same people that demanded cost plus a big profit during the war when our soldier boys were fighting in France, are now asking for the removal of income and excess profit taxes and a general sales tax be added. He said the farmer should recognize his responsibility to help himself.

Secretary A. C. Davis reported that the National Farmers' Union was conducting a larger volume of co-operative business than any other organization in America. Co-operative enterprises of the Farmers' Union have \$30,000,000 invested, and did a turnover of more than \$600,000,000 last year.

The National Milk Producers' Federation at a recent meeting adopted a resolution to make a national survey of cost of producing milk and milk products in relation to the tariff. They are setting up committees in various portions of the dairy territory in conjunction with other organizations which they are inviting to participate, the agricultural colleges and Department of Agriculture, to gather this information, which will be submitted to the committee on Ways and Means.

The funds for the payment of indemnities for reacting cattle slaughtered have been exhausted, and Secretary of Agriculture Wallace has drafted a bill calling for an emergency fund of \$405,000 to pay indemnities for tubercular cattle. Chairman Good is favorable to the passage of the bill and it is believed that it will pass Congress. The American Farm Bureau Federation is also backing the proposition. It looks now as though the work of tuberculosis eradication can continue if this bill is enacted.

HARRISBURG LETTER

The End of the Run.—The Legislature of 1921 is at the end of its run with every indication that its race against the records of appropriation has been won. The figures will not be known for some days, but it seems reasonable to assume that the aggregate of the bills carrying money sent to the Governor will be anywhere from \$125,000,000 to \$130,000,000. Millions are the smallest unit in which the legislators have appeared to think lately and as the value as revenue raisers of some of the taxation bills considered in the wind up is problematical there will be every opportunity for Governor Sprout to demonstrate his ideas in regard to economy. The Governor has made very definite statements in regard to economy and has informed some of his critics that a surprise is coming. On the other hand certain of the legislators were under the impression that the chairmen of the appropriations committees and the Governor were working together so there would be no necessity to reduce the allowances.

At the Front in Highways.—According to the figures on official records at the State Capital Pennsylvania is today building more highways than any state in the Union. Probably 140 of 171 contracts under way when winter began have been resumed and close to 500 miles are under contract with prospect of some thirty or forty new jobs being started within the next few weeks. Probably 100 miles more will be let in May so that by the middle of summer close to 750 miles may be considered in progress.

Secretary Plans Surveys.—Secretary of Agriculture Fred Rasmussen is planning some additional surveys to be made when the results of the apple, tobacco and vegetable surveys are published.

lished. There are still some details to be worked out on the latter, but it is well in hand and will be finished this summer. As a consequence the people of the state will have information authoritative and which can be considered in connection with Federal figures from the census.

Truck People Protest.—Some strong protests against the proposed increase of truck licenses and other regulations which would interfere with the operation of trucks on a different basis than at present. The situation in regard to trucks is that the state wants more money from them because of wear and tear on roads and the truck people contend they are meeting a definite need for transportation and furnishing service which would not be otherwise obtainable by many people.

Fight U. S. Standard.—The United States wheat standard is being opposed by state authorities, growers and shippers as discriminatory. Charges that garlic and other things have been found in Pennsylvania and Maryland wheat have been made and a protest will be entered at the national capital. The cost of the standard is held to be around ten cents a bushel against the two states.

Going to the Doors.—Farmers in many sections of the state have been sending word to the State Employment Bureau that they appreciate what the state is doing to get hands for them, but of late men have been appearing at the farm house doors seeking employment. In other words the farmers of the state are getting the effects of the swing of the pendulum. Four years ago they had to let fields lie fallow because of lack of hands. Now the industrial depression is sending men to the farm.

Licenses on the Back.—Under terms of the Long bill approved by the Governor a day or so ago hunters must wear licenses on their backs and any person violating the game laws or persistently trespassing on farms or annoying farmers may have licenses revoked. Regulations against securing of licenses under assumed names are also made.

Bills Approved.—The Governor has given approval to the bills forbidding misrepresentation and requiring State licensure of stallions and jacks, which also requires an annual registration at a \$10 fee. The Bureau of Animal Industry is placed in charge of the registration. Another bill provides that articles of food sold in standard containers that are original packages are not to come under the commodities act, while a companion bill relates to summary conviction.

Acresage Holds Up.—From all accounts the wheat acresage is going to run only about three or four per cent less than last season, but at the same time the mild winter will materially reduce the area that would be plowed under. Abundance of labor may head off some of the rumored reduction of acresage in other crops.—Hamilton.

NEW YORK LETTER

Milk Bottle Losses.—The Syracuse Milk Producers' Co-operative Association is trying to get consumers to co-operate in reducing the losses from broken, stolen or lost milk bottles. These losses amount to \$200 worth a day or \$73,000 per year. The average life of a bottle they find to be about three weeks. A fire in Dunkirk this week destroyed a half million milk bottles.

Churches Have a Value.—Welcome, a little community in Otsego County, closed its only church. Now they find there is no market for their farms, since buyers look elsewhere when they find no church privileges. The community is discussing reopening the church and starting a Sunday School.

Guernsey Club Expands.—The Cayuga County Guernsey breeders believe a sale does much to establish a breed. They have some fine animals and will arrange a consignment sale as a means of building up their industry.

Loyalty Demanded of Teachers.—A measure designed to promote and protect Americanism has passed both legislative bodies and will probably be signed by the Governor. It requires that no teacher shall be licensed whose instruction includes teaching of doctrine that organized government shall be overthrown by force, violence or unlawful means, or where the school or course is conducted in fraudulent manner.

Anesthetics in Animal Surgery.—Dr. W. S. Hollingworth, of Utica, is to address the State Veterinary College on the use of anesthesia for animals. The college has long urged their use and has experimented considerably in best methods.

Bovine Tuberculosis.—Eradication of this disease is making satisfactory progress in Tompkins County. Of 235 animals so far tested but 28 reacted. The last six heads tested located but one case.

Milk Given Children.—On learning that the fund to provide 550 children of the Syracuse schools with milk was exhausted the Producers' Co-operative Association of that locality promised to donate 140 quarts daily until May. Each school of the city has its weighing machine and measuring rod. Of the 26,500 children, 16,500 have been weighed and one-fifth of them found to be undernourished. Within the year 5856 quarts of milk and 25,424 lunches have been distributed.

Sixty Percent Syrup Crop.—The State College announces the 1921 maple syrup crop of New York to be 60 per cent of normal. It is believed the crop will all be sold. Prices have ranged from \$1.25 per gallon to \$3.00 and on maple sugar from 22 to 25 cents a pound.

Agricultural Buildings.—The Legislature gave no new appropriations this year to erect agricultural buildings at the state college, as the work will go forward on last year's appropriations. A sum of \$1,350,000 was allowed for yearly expenses, some items being cut while others were given more liberal funds. In no way many farmers believe, is the state's agriculture more surely protected and developed than thru the college.

Further Fruit Injury.—The last cold wave did perhaps more damage than previous ones. Sweet cherries and peaches were hard hit. Sour cherries were also cut badly. Apples have suffered considerably.

New Farm Data.—In the absence of the regular statistician, Prof. G. F. Warren, of Cornell, has compiled some interesting farm data. The number of people on the farms on February 1 was two per cent less than a year previous; the previous year saw a decrease of three per cent, and the year before 4 per cent. There are now 785,000 on the farms, or a third less than in 1840. About 40,000 men and boys left the farms last year to do other work, and 16,000 left other work to go to farming. The net movement cityward was 24,000. The number of boys reared on the farms each year is enough to cause an increase of 8000 men per year, if all remained on the farm. Last year's movement away from the farm was three times that number. Eleven per cent of the habitable farm houses are vacant. About 27 per cent of the farms are in need of extensive repairing; only 68 per cent are adequately fenced; 20 per cent need artificial drainage; over 50 per cent need lime. To make all these improvements would cost an average of \$20 per acre, or 417 million dollars, or 10 per cent less than the total 1920 crop value, or one-fourth the total value of the farms.

NEW JERSEY LETTER

Rural Scholarship.—The New Jersey State Department of Public Instruction calls attention in its last edition of "The Education Bulletin" to the fact, that the American Country Life Association is offering to rural school teachers a \$200 scholarship, which may be used in any normal school or college. It was stated in the publication, that a letter received by the State Department from Dr. Kenyon L. Butterfield, president of the association, read in part as follows: "The association recognizes the rural school, as one of the most important institutions dealing with country life, and hopes by this scholarship to add to the interest in rural education, to create better prestige, and to stimulate higher standards in this work. In offering this scholarship, the American Country Life Association aims to discover teachers, who are effectively adapting the rural school to its new conditions, and to find the methods by which this adaptation is being made with a view to stimulating the special preparation of teachers for the field of rural education."

Frost Damages.—Frost recently experienced in New Jersey will seriously affect the strawberry crop this year, according to a report of the State Bureau of Markets. It was added, however, that strawberry sections of the southern part of the state have not suffered as much damage as other sections of New Jersey. It was also said that it is probable that the best time to buy for canning purposes will be when Virginia, Maryland and Tennessee are at the height of their shipping.

Soil Report.—State Geologist H. B. Kummel has announced the publication of a bulletin of the geologic series, which is a survey of the soils of the Millville area in South Jersey. The section included in the report extends from Bridgeton and Cedarville east to the Atlantic Coast, and from North Vineland, Weymouth and Egg Harbor City south to Cape May. It comprises all of Cape May County, most of Atlantic and Cumberland Counties, and very small portions of Salem, Gloucester and Burlington Counties. The report, which is of a scientific nature, consists of a general description of climatic and soil conditions within the area, and a classification and description of soil types, accompanied by a large colored map and photographic illustrations. It is based upon field work done by soil experts from the New Jersey Department of Conservation and Development and the Bureau of Soils of the United States Department of Agriculture working in cooperation.

Exhibition Buildings.—Three new buildings that will be of vast value to the raisers of crops in the state service as well as the rank and file of farmers are to be erected at the exhibition grounds of the Inter-State Fair Association in Hamilton township, Mercer County, before the opening of the fair next September. The structures will cost approximately \$80,000.

Daylight Saving.—Daylight saving has gone into effect in Trenton, Morristown, Princeton and other central Jersey points. The plan will be continued under local municipal ordinances until September 25, the last Sunday in that month. The freight stations in Trenton on the lines of the common carriers will be opened under the plan and closed the same way.—Kelly, Trenton.

MILL'S JOE

By
M. ROBERTS
CONOVER

"IT'S nothin' but drudgery from mornin' till night, Mill. Sometimes I wonder what it's all for. I get up in the mornin', work all day, go to bed at night and get up the next mornin' and do it all over again. What fer? Just to get enough to eat an' to wear, an' not much else. What's it all fer, Mill, this what we're doin'? I'm tired of it. I wish—I wish I had a thousand dollars an' I'd—I'd—spend it," concluded the man lamely.

"What'd you spend it fer?" asked his wife curiously.

"Oh, havin' a good time, goin' somewhere, seein' something, havin' a gran' old time."

"Where'd I be?" asked the woman jealously.

"You?" her husband rubbed his forehead reflectively for a moment. "You? Why, I spose you'd be right here."

A dull wave of red rose about the woman's neck and flooded her face to her hair, but she didn't look up from the work she was doing. The man watched her narrowly for a few minutes but she neither moved nor met his eye. He stepped gingerly across the floor and stood over her a moment, but she remained with her head bent toward her work. The man bent over her and scanned the drooped face, his long nose almost touching a lock of her brown hair.

"Pooh! Mill, you didn't suppose I meant it did you? You didn't suppose I was goin' to run off an' leave you, did you? Pooh! Pooh! Thought I was goin' skylarkin' off with someone else and leave you here to home did you? Well, well, you ought to know me better than that?"

He patted her awkwardly on the back of her faded house-dress, and chuckled her under her quivering chin.

"No, no! If I go off to spend a thousand dollars, I reckon I'll take you along to see how it's going to be spent."

There was a swift change over the worn features of the woman.

"Joe, ain't it just nonsense to talk about spendin' money when we ain't got enough of it to last us fer necessities? How'll I fix the sweet potatoes fer dinner, roast or baked?"

"Better blee 'em, Mill. They'll proloug out futher that way. Yes, I spose it's right silly followin' my 'magination like that, but I git quite a lot o' fun out of it sometimes especially when we're feelin' kind o' down like we are now. But I don't leave you home alone Mill. I always take you along. You ought to be used to my foolin' by this time. Want to go to town with me Mill? I have to have some nails for the shed. We'll be back by dinner time."

The woman brightened perceptibly.

As they sat in the little old unpainted buggy behind the old gray horse, Mill remarked that the country looked dreary.

"Yas, yas. It's dreary enough this time of year. What d'ye say if we pertend we've got that thousand dollars? It'll kind o' be somethin' to think about while we're ridin' along?"

"Joe, you gettin' foolish?" asked his wife with a wry face. The jolt of the buggy over the stony road hurt her back and made her irritable.

"No, only pertendin' to keep up my

spirits," said her husband and laps-ed into silence which he broke after several minutes.

"We could have dinner at the Riordan."

"Huh!" exclaimed his wife.

"And go to a show afterwards."

"Huh!" repeated his wife.

"An' we'd put old Polly in the livery stable. Hank Witten would be glad uv that. He don't git many horses since aufymobiles has got so numerous."

"Joe!" His wife poked him in the side with her elbow. Why don't you git an airship? Long's you're talkin' in?"

"An' so I will, an' so I will. Aufymobiles 'I' be out o' date before long. We'll have an airship."

"Well, you was only wishin' fer a thousand dollars, an' that wouldn't buy an airship. Why don't you wish more effectual, Joe?"

How a Farmer's Wife Earned a Dollar

In a little brown church near the Chenango River There's a Builder's Class, whose heart strings quiver. They decided to earn a dollar one time And tell how they earned it in sort of a rhyme.

Now, as you know, I'm a farmer's wife Which some folks think is an easy life, But I'll tell you what, when it comes to work It's no place for a first-class shirk.

To prove this fact I'll tell you how I earned my dollar with a dairy cow. My husband bought one which he gave to me And I surely thought I should quite rich be. For he said the calf should also be mine If I'd teach it to drink and save his time.

In ignorance I thought this an easy task, Such thoughts now are entirely past. I spoiled two pails, spilled ten quarts of milk, Ruined three dresses (one partly silk). In trying to teach that stubborn calf To drink his milk without spilling half.

He bit my hand nearly off my arm And caused the doctor to come to the farm; He broke his rope and ran away And I chased him 'round nearly half a day. Over field, and garden and flower-bed 'Til I surely thought I was nearly dead.

I said to myself, "Before I sleep I'll sell that calf to the first man I meet." I sold the calf for a ten-dollar note And decided next time I'd prefer a goat. For after I paid the doctor's fee, Bought some pails and a dress for me, To take the place of one I spoiled, To say nothing of the hours I toiled, I had a dollar to show for my work. Do you think I earned it, or did I shirk?

—D. A. H.

"Well, how much would effectual be?"

"Oh, ten thousand dollars maybe, I don't know. I do know it's about time we stopped this foolishness though."

"Guess 'tis. Here's town."

The horse trotted down the main street past the line of parked cars, and turned into a side-street where Joe made him fast to a post yet standing for just such unusual occasions as this. It was ten o'clock. "I'll be ready in about an hour," said his husband.

His wife spent a half hour looking in the windows and watching the people as they passed before she went to the post office to ask for their mail. But in the meanwhile, Joe had been there and taken it. The big clock above her struck once. It was half-past ten. She stood near the wall resting first on one foot and

then on another. The post office was a good place to see folks.

At the right of the desk was a collection of notices of things lost and found on the streets of Merton. She took a curious sort of pleasure in reading them over. Afterwards she would let herself think how the woman must live who had lost the gray fox muff, or the girl whose lap-dog had strayed.

A man approached with a piece of paper in his hand and affixed it below the other notices. When he went back within the enclosure behind the mail-boxes, she read it. Someone had lost a one thousand dollar Liberty Bond. She didn't stop to read who for at that moment the door opened and a short man puffing under three heavy mail bags bustled past her and on into the regions beyond. Presently the clerk who sorted the mail waved something toward her. It was a small magazine which came once a month and contained interesting stories and some household hints. Mill brightened as she took it and went out.

That night they ate their supper

"I wasn't foolin', Mill. There must be somethin' in wishin'. I've unexpectedly come into a thousand dollars."

His wife stared at him incredulously and then asked without belief, "How'd you come by it?"

"Mill, I don't know as I'm tellin'. I know. That's enough. You're proper cross tonight," and he sat back with a peculiar smile about his lips.

Her curiosity got the better of her pride and she continued to ask question after question to no avail, getting only the cryptic reply, "If you knew, you wouldn't be askin'."

Mill was puzzled, then worried. When her husband slept that night, she tossed restlessly. She seemed to see again below a long list of notices of articles lost and found, the words, "Lost a Liberty Bond, Denomination, One Thousand Dollars."

In the morning she stood by her kitchen table nerving herself while her husband had just gone out with the ashes. When he came in, she said, "Joe, someone lost a thousand dollar liberty bond on the street in Merton yesterday morning after ten o'clock."

Her husband rattled the covers of the stove and made no reply. She looked at him and repeated her statement, but he bent unheedingly over the stove adjusting the drafts. Her voice rose.

"Joe Binkley, someone lost a thousand dollar liberty bond on the street in Merton while we were there!"

Her husband glanced half way round.

"Mill, that brick is cracked in the fire-box. You'll have to write to Bonson for another," he said.

Mill stood rigid convinced that his evasion of the subject confirmed her suspicions.

Joe diligently brushed the ashes from the top of the stove, as he said, "Mill, you won't forget it, will you? He can bring it over when he comes Tuesday. This brick'll give way some morning when I'm makin' the fire and I'll be in a fix. I'll pay him for it and for that zinc I got last week when he comes."

Mill went dully into the pantry for some oatmeal. Her head ached and she felt wretchedly alone. Once within the pantry she clinched her hands high above her head, in a strangely appealing attitude.

"I'd rather have anything else happen than to have Joe keep what didn't belong to him," she muttered. She held herself together with an effort, and went back to the kitchen with the steamer in one hand and a bowl of porridge in the other. She could see her husband making his way toward the barn with his head bent slightly forward.

When he returned his manner was curiously depressed. They had eaten breakfast almost in silence and she was just rising from the table when someone knocked, and as Mill called, "Come in!" a tall, sharp-featured woman entered.

"I've brought you a piece of news! The Pikers are in bad luck again. Eph Piker lost a thousand dollar liberty bond in Merton the other mornin'. What with Willie's broken leg and their barn burnin' down, they are in bad."

Mill clutched the back of the chair. Her eyes rested upon her husband who had focused his gaze upon a tiny piece of browned fat left in the center of the bacon dish. He said:

"Eph ought to advertise fer it. Was it registered?"

"No, it wasn't registered, and he's advertised fer it in the paper and in

the post office and he's put the notice on it."

Mill's Joe got up suddenly.

"Pleasant weather we're havin', Jennie," he said and went out.

Her neighbor went on her way and Mill stood looking out at the window watching her husband as he swept off the path toward the smoke-house with the stubby old porch broom. In her heart an agony of love and humiliation. She went to the door and impelled by her anxious curiosity called to him.

"Joe, what can we be doin' fer the Pikers?"

Joe stood up a moment and rubbed his head.

"I don't know, Mill. I hadn't thought much about it."

"It's full time you did!"

Mill's eyes burned down at him from her height on the kitchen porch. In all her married life she had never felt such a feeling toward him. She leaned against the door post until she could brace up under it.

A half hour later, her husband drove down to the blacksmith shop. Mill made her way to the attic. Up under the eaves was an old tin lard pail. She worked its close fitting cover loose and felt into its contents.

There was the deed for their land, the insurance paper, a bag of old coins, and an old photograph of her husband's mother. These she had expected to find, but there was also a long brown envelope of stiff paper that was new to her. She laid back the flap and drew out a thousand dollar Liberty bond. She sat still with it in her lap trying to feel that the world hadn't turned over, that the glimpse of sun-lit field thru the attic window wasn't a mockery, aching for warmth, and hope and trust, and then she returned the other things to the lard can and went down stairs with the stiff envelope in her hand.

Dinner consisted of boiled potatoes and some cabbage re-heated from the day before, but it might have been a king's feast as far as the spirits of Joe were concerned. He had entirely recovered his buoyancy and heedless of his wife's stony calm, talked of his plans for their little farm for another year, of the new cow he was going to buy and the hog-pen that was to be rebuilt. He went out clatting, whistling "The Lark's Wedding," on his way to the barn to sort apples.

Mill dressed herself quickly and walked the three miles to town. She made her way to the town hall, and to the office of the town's chief of police. Placing the bond before him, she said:

"The bond that Eph Piker lost day before yesterday has been found. I've brought it over."

The officer took the envelope from her opened it and compared the enclosure thoughtfully with something in his book, looked slightly puzzled and asked:

"What is your name, Madam?"

Mill told him.

"You found this bond?"

Mill gulped an instant.

"Yes," she said.

"Very well, I'll hold it right here in the safe and communicate with the loser."

Mill went home, tired but relieved. When her husband came in she had prepared a delicious supper of stew meat and vegetables. She warmed up his slippers. She moved the light to a better angle that he might read. She was solicitous and tender with a yearning tenderness in her face and voice. She might have been his

mother and he an erring boy. When he dozed over his paper, she leaned and stroked his hand hungrily.

"I'd do anything for you, Joe, anything under the sun that's right. I'd die fer you. But I can't have you doin' anythin' that ain't strict honest," she whispered huskily.

He stirred in his sleep but did not waken.

When she came down next morning, her husband was rounding off a tall hamper of apples.

"I was just thinkin', Mill, I'd take these apples over to Piker's. It'll sort o' reimburse them fer their bad luck."

She hesitated a moment. They were not so replete with provisions. She had taken the steps toward righting their loss.

"I don't know as I'd do it, Joe—"

she hesitated, stifling her throb of pain at Joe's substitution. "No, Joe, I wouldn't bother," she said with a peculiar air.

"Well, I'm a botherin'," said her husband firmly as he fitted the cover to the basket. He looked out of the window a moment.

"Here comes Jennie Clay again," he said.

Mill opened the door and admitted her guest.

"I've come fer a pie's makin' o' lard," she announced standing excitedly in the middle of the floor, "and I've got news that's more'n surprisin'. It's the Pikers. They've got back the Liberty Bond Eph lost."

"Is that so?" asked Mill dryly.

"How'd they get it back?" asked Joe clinching the fastening of the basket.

"How'd you spose?" Jennie looked from one to the other of her hearers.

Mill's gaze searched her husband thru and he met it with a wondering stare.

"Give it up, Jennie!" said Joe.

"Martha Piker found it in the lining of Eph's top coat right where he'd put it thinkin' it was goin' into his pocket," she announced.

Mill started, but Joe said: "It don't surprise me none. Eph's lost things in his clothes before. He advertised everywhere and almost accused his hired man of stealing his gold watch that his Uncle Sol Piker had given him one time, and then went home and found it in the toe of his rubber boots where he'd dropped it by accident."

Mill moved mechanically toward her lard bowl. There was a worried flush on her cheek bones.

"Is one pie's makin' enough, Jen?" she asked.

When she had gone, Joe twirled the basket of apples toward the space under the window. "I've a mind not to take them over, after all, Mill," he said. "It about serves him right. The idea o' advertisin' all over for somethin' in his top coat!"

He went over to the clock-shelf and reached for his wallet.

He took out a roll of money which fell loosely apart as he pressed it into his wife's hands.

"Mill, this is your birthday," he said, and then stood looking at her, striving to interpret her look of alarm.

"Mill, what's seemed to all you lately? Is anything wrong with your liver? You've seemed to be broodin' like as if there was somethin' on your mind. What's between us girl?" he asked anxiously.

Mill's lips parted for speech. She leaned forward summoning her wits. "Joe," her voice came tense and strange thru her lips. "Where'd you get that money?"

Her husband looked at her still wondering at the painful tension of her.

"Why, Mill, that legacy from Uncle Arthur Swim's estate has been paid. I'm ownin' a thousand dollar liberty bond and a little cash beside. I kept it from you, because, well just because I felt like keepin' it to myself, till I felt like tellin' it."

Mill went forward toward Joe with a strange appeal in her manner. She dropped on her knees beside his chair and stroked his hands repeatedly. She felt like saying something but she couldn't speak. Her husband soothed her gently.

"Why Mill, you're all upset over it! Your man don't give you such a present very often does he?"

Suddenly Mill sat up with a strained look.

"Joe, harness the horse! I've got to go to town—let's both go to town right away!"

But Old Father Elephant had a great big heart and that heart spoke right up loud to him and said, "Now you forget all that Old Man Leopard has done against you and protect him from Old King Lion and Tawney Mane and that will heap coals of fire upon Old Man Leopard's head and punish him more than anything else possible in the Great Jungle."

Wasn't that a 'stordinary thing for I do? Oh grief! why can't there be some way for me to wash my broad back and get rid of those mean, stinging, biting insects?"

Old Father Elephant shook his huge ears mournfully and with a long face started deep into the fastness of the Great Jungle, seeking to bury his troubles in its dark recesses.

He had not gone far, however, before he heard a great snarling and roaring and before he had time even to think, Old Man Leopard backed out of the deep thicket and right against Old Father Elephant's sturdy legs and close behind him, roaring with all their might, came Old King Lion and his son Tawney Mane. Evidently, Old Man Leopard was in trouble and there were no prospects of his getting out of it very soon. All of this pleased Old Father Elephant immensely for Old Man Leopard was his greatest enemy and had tormented the good Father Elephant tremendously. Now he was in his power and he had but to raise his foot to kill him himself or push him into the reach of Old King Lion and Tawney Mane.

But Old Father Elephant had a great big heart and that heart spoke right up loud to him and said, "Now you forget all that Old Man Leopard has done against you and protect him from Old King Lion and Tawney Mane and that will heap coals of fire upon Old Man Leopard's head and punish him more than anything else possible in the Great Jungle."

Then Old Father Elephant turned around to see what had become of Old Man Leopard and would you believe it? There was no Old Man Leopard but in his place stood a fairy sprite.

Old Father Elephant was so astonished that he said not a word, but stood with open mouth. Soon the fairy sprite spoke and oh, how she did praise Old Father Elephant until he fairly blushed from his extreme modesty. His heart swelled and swelled until he thought his chest would burst and the, oh joyful moment! the little sprite presented him with a nice long trunk so that he could throw water all over his broad back as much as he pleased and drive away the little biting, stinging insects.

Now wasn't that a most 'stordinary story, my little folks?—S. K. S.

"Slow now! You're in a hurry! Want to spend that money I suppose. Well, I don't know as there's anythin' to hinder this afternoon. We can go to the movies, before we come back."

That evening, Mill came softly down the attic stairs and when her husband came in from the barn, she dished the warm supper with a smile on her face. She looked up at him happily.

"Gee, it's sort o' nice when things look prosperous, ain't it? You say you've got a thousand dollar Liberty bond as well as cash?"

"That's the right of it, Mill," said her husband complacently.

"Joe, you'd better see that Liberty bond's in a safe place. The bank would be about right fer it."

"P'raps it would, Mill. P'raps you are right about that," replied Joe Binkley thoughtfully.

A Story for Children

How Old Father Elephant Got His Long Trunk

OLD FATHER ELEPHANT was in great trouble, for in all the Great Jungle, he could find no waterhole deep enough so that he could wash his broad back. Oh my! how the insects did bite and he could not begin to reach the pests. "Truly," thought Old Father Elephant, "I might as well be dead for I can't enjoy myself in the Great Jungle with all my troubles, yet I don't want to leave it. What shall I do, what shall I do? Oh grief! why can't there be some way for me to wash my broad back and get rid of those mean, stinging, biting insects?"

Old Father Elephant shook his huge ears mournfully and with a long face started deep into the fastness of the Great Jungle, seeking to bury his troubles in its dark recesses.

He had not gone far, however, before he heard a great snarling and roaring and before he had time even to think, Old Man Leopard backed out of the deep thicket and right against Old Father Elephant's sturdy legs and close behind him, roaring with all their might, came Old King Lion and his son Tawney Mane. Evidently, Old Man Leopard was in trouble and there were no prospects of his getting out of it very soon. All of this pleased Old Father Elephant immensely for Old Man Leopard was his greatest enemy and had tormented the good Father Elephant tremendously. Now he was in his power and he had but to raise his foot to kill him himself or push him into the reach of Old King Lion and Tawney Mane.

TALKS WITH THE BOYS

To the Boys:

A long time ago I read a story about one of the Presidents, I think it was Grant, which told how he learned an important lesson while still a boy. Probably many of you are familiar with the story and can check me up if I go wrong. As I remember it the boy Grant got a job chopping wood with some older men. They were working on a hill along a big river and it was a great pleasure to the boy to watch the boats going up and down and to long for the day when he would have a chance to travel on one of them.

It seems that the wood choppers were divided into groups of two each and it happened that the boy's partner was an old man who was quite feeble and could not chop very fast. The boy would make the chips fly twice as fast as the old man and he was very proud that he could beat the experienced man. However, it was not long before he began to realize that there was something wrong. Altho he could chop twice as fast as the man, at the end of the day the pile of wood which he had chopped was not nearly as large as the old man's. He was completely mystified for a while and could not account for the strange situation. Finally it dawned upon him what the trouble was. When he stopped to load the boats on the river and dream of the day when he would perhaps be captain of one of them the old man kept right on working. He worked slowly but by keeping at it he accomplished more than the boy who worked very fast but who stopped often.

I am sure that the lesson this boy learned back in the early days long before the Civil War is one which will help us all a lot if we resolve to profit by it. There are many people who do not learn it until they are too old to profit by it. Nearly every man looks back to his boyhood days and thinks of a lot of things that he wished he had done, things that perhaps he started to do but did not keep at long enough to do any good. You are all familiar with the fable of the rabbit that was beaten in a race by a turtle. The turtle was very slow and the rabbit was fast but the turtle kept moving and the rabbit stopped too many times along the way. He didn't keep "chopping wood."

We have some good letters this week and after you have read them and decided to write one yourself I would like to have you answer a few questions for me. What is wrong with this page? Someone says that it isn't big enough. That surely is true but how about making it better before we talk about making it bigger. Perhaps when we have made it a little more attractive we will be able to get more room. Someone says pictures. That sounds good. Don't you think that the page would be a lot more attractive if we had some good pictures of our boy friends to brighten it up. Send us some of those good pictures of your pets, of interesting places and things and of your work on the farm. We will all be interested in them.

We cannot promise to publish all that are sent in because there are many good camera pictures which do not make good "cuts" when made up to print in a paper, and of course we do not have all the space we

would like either, but we want to see what you are doing as well as to read about it in your letters. Let's have some good letters with pictures—illustrated letters we shall call them.

Sincerely,
The Editor

LETTERS FROM THE BOYS

Dear Editor—I live on a farm of 132 acres. I have four sisters and five brothers. I am in the fifth grade and have to go two miles to school. We have two horses, four mules, five calves, 14 sheep, 21 little lambs, six cows, four pigs, 93 little puppies, 150 chickens and some geese.

We have a tractor and two gasoline engines—one of them is a 12-h. p. and is used for chopping; the other is a 24-h. p. and is used for pumping water. We have electric lights and an electric washer—in fact, we have all kinds of farm implements.

I harrow and roll the fields and help father in many ways. I always go to the post office to get the mail.
—John C. Burdge, Hunt, Co., Pa.

Dear Editor—I am fourteen years of age and am in the eighth grade in school. I like to go to school; it is about a mile and a half from our home. I have one older brother and a younger sister. We live on a place of three acres. We keep chickens and hogs. I help raise the chicks and have some of my own. We are going to get a larger place where we can raise more fowls. I have some money in the bank and am going to put more in this spring.
—John J. Sheely, Adams Co., Pa.

Dear Editor—I live on a farm of about 65 acres and I like it. I used to be a city boy, but I would rather live in the country. We take the Pennsylvania Farmer and like it very much. It is nice to come up from the field and do your work at night and then go in the house and sit down to read the Penna. Farmer. I always like to read the letters the boys write. I am going to build a bird house and some houses for pigeons.
—Howard Johnson, Cumberland Co., N. J.

Dear Editor—I am eleven years old and go to school every day. I am in the fourth grade and have eleven books to study. I have one brother but no sisters. Last year I earned five dollars for not missing a spelling word.

I live on a farm of about fifty acres. We have four cows, one heifer, two horses and a little Holstein calf which I tend. Last October we had a litter of fourteen little pigs and these we raised. We have now dressed eight of them which weighed nearly 1300 pounds and the other six we will market in about a week.

My father likes chickens and his favorites are the brown Leghorns. We have about 200 hens and get as high as eleven dozen eggs per day.
—Lester S. Derr, Union Co., Pa.

Dear Editor—I like to read the Pennsylvania Farmer, especially the Boys' Page and the serial stories. I am twelve years old and go to school. I missed a few days last fall helping to fill the silo. We have a 44-acre

farm, a 60-acre pasture and some woodland in Haycock mountain which is between three and four miles from here.

My father has three horses and some cattle. We have a touring car and a sedan. I have a lot of guinea pigs and made more profit with guinea pigs than with rabbits. I like to trap and this season I caught a skunk and three muskrats. I have a liberty bond and war saving stamps. I belong to the Junior Soldiers of the Soil and to the Liberty Bell Bird Club.
—Kenneth Fretz, Bucks Co., Pa.

Dear Editor—I am ten years old and have been making my home with James W. Hinton and family for two years. We have a farm of 105 acres and have four horses, six cows, three calves, and a registered Guernsey bull. We also have a collie dog named "Sammie." I go to Sloan's Hollow School. We have an automobile and a gasoline engine and I like to work on the farm very much. Arlynn Downing, Bedford Co., Pa.

Dear Editor—I have been living on a farm for the last ten years but now expect to move to the city. Our farm of 100 acres includes 50 acres woodland and five small meadows. Our home is located near a creek which runs all summer. We have three horses, nine cows, five calves, three white rabbits, 100 geese and 500 chickens.

I am thirteen years old and am in the eighth grade in school. I have one sister older and one sister and three brothers younger than I am.

I like to cultivate the ground and also to plow. I forgot to say that there are two wells on our farm, one near the house and one by the barn.
—Benjamin Sonnerstein, Bucks Co., Penna.

Dear Editor—I am eleven years old and live on a farm of 240 acres. I go to school every day and am in the sixth and seventh grade. There are eight in our family.

We have four horses and a pony, sixteen cows and eight calves. Father gave me a calf to raise as my own. We ride the pony to get the cows in at night in the summer.
—O. F. Ferris, Wyoming Co., Pa.

Dear Editor—I am eleven years of age and live on a farm in Lancaster County. I go to school and like it very much. I am in the fourth grade and have seven books. This is the last day of school, but I have not gone to school for a while because I am just getting over the measles.

My father works in the sawmill up on the hill. My brother who is fourteen years of age raises tame pigeons. One of the males died and his mate found another partner among the wild pigeons in the barn. We have 14 pigs, five cows, four horses, eight steers, three geese and about 200 chickens.
—J. M. Musser, Lancaster Co., Pa.

Dear Editor—I am interested in the Boys' Department. I am twelve years old and the oldest boy in the family. I live on a sixty-two acre farm. I like farming and I go to school. I am in the seventh and eighth grade and have a mile to walk.

During the summer vacation, I roll, rake, and mow. I also help haul in the crops. I milk two cows and I like trapping but that didn't pay very well last winter.
—School Boy, Bucks Co., Pa.

PASSING EVENTS IN PICTURES

1—Four little invalids of the Masonic Hospital, learning to make their own toys.
2—Yankee tars set world's record for anti-aircraft gun fire and prove the worth of warships.
3—One of the pontoons which will be used in an attempt to raise the wreck of Spaulding's famous yacht "Isis" from the bed of the ocean.

4—No, you're wrong—they're not grapefruit or cantaloupes, but merely Adammer cheese, a product of the Netherlands.
5—This bridge spans the Columbia River, connecting the states of Oregon and Washington.
6—An antique Chinese statue of Compassion, now in the Boston Art Museum.

7—The largest Bus in the world. It is 60 feet long and has a carrying capacity of 150 medium-sized persons.
8—Witherow, Ring and Brugg, three of the Phillies players, who recently demonstrated their prowess in the "good old game" during a match with the Washington team at Jacksonville, Fla.

The market on old potatoes is ruling slow and dull with supplies more than ample for the market's requirements at this period of the year when the southern new potatoes are coming in. There are still some 35 cars of old potatoes on track here this morning in the Reading and the Pennsylvania delivery yards most of which were not what might be termed fancy. The market is ruling at 80¢ per cwt. for the best, down from 80¢ to 81 per cwt. with some at \$1.10, while one car of Pennsylvania potatoes in sacks sold at \$1.25 per cwt. These hauls are being sold at 75¢ per cwt. for the best, 73¢ to 75¢ per cwt. for the bulk. The new crop of potatoes from Florida are selling at mostly \$0.75 to 7.25 per barrel for No. 1, with No. 2a mostly \$0.50 to \$0.64 per barrel, some \$2 to \$3 per cwt. sold here this morning at these prices.

[illegible]

Eggs showed some recovery over the price paid for about two weeks, some receiving 25c dozen. Potatoes continue their decline, and the market is expected to slip except a few in the hands of dealers.

Eggs—2½ to 28c. per dozen.

Butter—Country, 50¢ to 60c lb.; separator, 60¢ to 65c lb.; milk, 10c qt.

Poultry—Hens, 24 to 30c; 50c lb.; dressed, \$1.25 to 2.50 ea.

Vegetables—Potatoes, 5 to 8c ½ pk.; 20 to 40c lb.; cabbage, 3 to 10c lb.; lettuce, 50c lb.; cauliflower, 10 to 15c lb.; green beans, 5c lb.; onions, 5c lb.; lima beans, 20c qt.; snap beans, 10c lb.; qt. lard, 14 to 18c lb.; cashew nuts, 10 to 15c lb.; raisins, 10 to 15c lb.; spinach, 10 to 18c ½ pk.; hams, whole, 40 to 50c lb.; sliced, 40 to 80c lb.

Fruits—Apples, 25 to 50c ½ pk.; straw-berran, 25c.

Retail Grain Market—Wheat, \$1.75; corn, 80c; rye, 75c; rye, \$1.40; bran, \$1.75 cwt; middlings, 25c.

Wholesale Grain Market—Wheat, \$1.25; corn, 80c; oats, 50c; rye, \$1.25; bran, 83c per ton; middlings, 40 per ton.

Butter unsettled; receipts, 4904 tubs. Creamery higher than extras, 71 1/2¢ to 42¢; do extras (92 score), 41¢; do firms (88 to 91 score), 40 1/2¢; packing stock, current milk, No. 2, 31¢.

Eggs steady; receipts, 25,016 cases. Fresh gathered, extra firms, 25 1/2¢ to 29 1/2¢; firms, 26 1/2¢; State, Penna. and nearby Western 26 1/2¢; white, extra firms, 33 1/2¢ to 41¢; do do brown, extra firms, 34 1/2¢ to 40¢; do do brown and mixed colors, firms to extras, 27 1/2¢ to 31 1/2¢; storage packed, extra firms, 30 1/2¢ to 33 1/2¢; do do, 28 1/2¢ to 32 1/2¢.

Cheese unsettled; receipts, 3479 boxes. State, whole milk, flats, held speculative, 27 1/2¢ to 29¢; do average run, 24 1/2¢ to 26¢; do fresh extras, 26 1/2¢ to 21¢; do average run, 19 1/2¢ to 21¢.

Livestock nominal; no quotations; dressed, steady and unchanged.

Vegetables—Mich., sack, \$1.75 @ 1.85; York State, bbl., \$1.75 @ 1.80; sweet potatoes, hmptr., \$2 @ 2.25; green peas, Fla. crate, \$1.50 @ 2; onions, h. g., 100-lb. sack, 75c @ 80c; corn, 40-lb. sack, \$1.50 @ 1.75; French, 30c; Brussels, 20c @ 25c; artichokes, \$2 doz.; shallots, 40 @ 65c doz.; watercress, 25 @ 35c doz.; kale, \$1.75 @ bbl.; lettuce, 3-lb. basket, 45 @ 50c; do 10-lb., 1.25 @ 1.50; cauliflower, hmptr., 20 @ 25c; radish, 12 @ 16 lb.; parsley, 40 @ 75c doz.; radishes, 25 @ 35c doz.; cucumbers, h. h., \$5 @ 6 crate; mushrooms, \$2 @ 2.25 basket; carrots, 15 @ 1.50 hmptr.; rhubarb, Mich., \$5 @ 75c, bunch.

chickens no Leghorns bring the fine price of 65@75c lb., with the Leghorn brooding chickens at 60@65c lb. Old roosters are slow at 18@22c lb., and ducks are also lower at 28@32c. Dressed poultry is also easier at 31@40c for fowls and 25@27c for roosters.

Eggs—The market on eggs is ruling about steady with prices at this writing as follows: Penna. and other nearby current receipts, 50¢ doz.; nearby extras, 52½¢. Fancy selected and candled nearby eggs are selling out at 35¢ @ 36¢ per doz. Southern eggs are selling at 34¢ @ 35¢ per doz. Western eggs are quotable at 25½¢ @ 26¢, with western extras firsts at 26½¢ per dozen.

LANCASTER PRODUCE

—April 23, 1921.

The markets were well attended this morning and an abundance of fresh vegetables were on hand. Eggs opened at 32 cents but held later at 30 cents generally. Asparagus opened at ten cents a bunch and held to 10 and 10 cents a bunch. The quotations:

Butter and Eggs—Country butter, 50¢ @ 55¢ lb.; creamy butter, 60¢ lb.; eggs, 30¢ @ 32¢ per doz.; creamery eggs, 40¢ @ 42¢; loose eggs, 40¢ @ 50¢ each.

Poultry—Chickens, dressed, 32¢; broilers, 35¢; turkeys, 40¢ @ 42¢.

Vegetables — Asparagus, 10¢ @ 15¢ lb.;

of hay and 4 cars of straw. We quote: Timothy hay, No. 2, \$22.50@23; No. 3, \$20.50@21; sample, \$17@19; no grade, \$14@16; clover mixed hay, light mixed, \$21.50@22; straw, No. 1 straight rye, \$19@20; No. 1 wheat straw, \$17.50@18.

Bran slightly higher. Car lots, including sacks, soft winter bran, in 100-lb. sacks, per ton, \$27.50 @ 28.50; spring bran, in 100-lb. sacks, per ton, \$26.50 @ 27.50.

Wheat—Quotations follow: No. 2 red winter, \$1.48 @ 1.53; No. 2 red winter garlicky, \$1.39 @ 1.44

Corn—Quiet and 1c lower. Car lots, in export lots, per bu., No. 2, 76½¢ 76½¢; No. 3, 73½¢ 73½¢; No. 4, 71½¢ 71½¢.

Oats—Firm and ½¢ higher. Car lots, as to location: No. 2, white, 51¢ @ 51½¢; No. 3, white, 50¢ @ 50½¢; No. 4, white, 46½¢ @ 47¢.

Market very flush and altho business is good at the close, trade was slow early in the week. Surplus extremely heavy and distributors' have all their cash tied up in manufacturing plants. The April zone is 8 per cent milk in 200-mile zone is \$2.10 per 100 lbs.; 3.6 per cent is \$2.34 and 4 per cent milk, \$2.50. May rate will be 20c higher or \$2.30 per 100 lbs. for fluid 3 per cent milk in 200-mile zone. Receipts of milk and cream in 40-quart cans for the week ending April 23, 1921, were as follows:

	Beef cattle.	Sheep & lambs.	Hogs.
Totals for week	2366	6314	9170
Previous week	2329	7567	9393
Calves—2519 as against	2168	previous	
week.			

Butter—Receipts, 1719 tubs. There was little trading and with lower outside advices and general pressure to sell prices here declined 4c on both solid-packed creamery and exports. We quote Solid-packed

Our Business Letter

COMPETITION for feeder cattle has waned as a result of the performance of the fat cattle market and reports of losses, especially by those cashing in heavy steers, are more frequent. Values declined during the past week but there is little increase in the margin between stockers and feeders and fat cattle. Some Wisconsin buyers again outbidding the packer market. The movement to the country from 63 markets during the last three months is 26.7 per cent below 1920 which in turn showed a decrease compared with the preceding year.

From Whence Come the Hogs?	Wheat Markets Harden
<p>Hog markets are overwhelmed with numbers, the combined total for the year to date being now almost equal to that of last year. At the same time weights remain high. If the run continues at the present rate it will soon overtake that of last year and the price outlook for the summer market will not be encouraging. Early winter estimates upon the hog population evidently</p>	<p>After reaching a new low point on the crop, wheat prices developed firmness as a result of the refusal of the growers to sell on the lower market. Cash wheat which seemed abundant and was steadily decreasing in price suddenly became scarce at some of the markets. In spite of liquidation by growers for nearly two weeks, stocks were not increased and clearances from North Amer-</p>

Milkers and Springers

Milkers and springers constitute a market class on most of the livestock markets but they are especially prominent at South St. Paul, Minnesota dairymen buy large cows usually carrying considerable flesh and already in milk known as "milkers" or "cows" due to freshen soon which are known as "springers" and take them to their farms, where they are milked as long as they are producing heavily and then returned to market. The same practice is followed to some extent by eastern dairymen. Sometimes cows showing considerable dairy breeding are also used in this way.

There was an ominous quietness in tobacco market matters owing largely to outside influences, it was claimed. For some time it has been alleged that an intrigue of influential persons in the market had been working to depress prices. A few weeks ago the attempt of packers to unduly depress prices was detected and now it is known that the same is more or less general in scope. This movement is following prices down to such a point that it is low but possibly to \$7 or \$8 per cwt. or lower, but if growers will ignore confederate offers and await the time when tobacco is needed a fair price will be obtained.

There has been a considerable amount of hay of poor quality arriving at Pittsburgh market during the past week. It is a difficult matter to realize even the prices quoted. No. 1 timothy and standard are disposed of readily, but the other grades show an accumulation which cannot be placed. Market dull. Straw receipts very light but demand is likewise, altho arrivals can be placed at quotations.

A little better feeling on oats, altho not enough to warrant heavy shipments while

Clover, cash, new, \$12.50; April, \$12.50; October, \$9.40
Alfalfa, new cash, \$13.50;
Timothy, cash, \$3.05; April, \$3.05; May, \$3.05.

April. The price for three per cent milk remains \$3.28 per 100 pounds and 7.1 cents per quart for basic quantities, with an in-

Baled Hay and Straw—Receipts, 60 tons

Altho the strong probability of the passage of the emergency tariff has

iled to stimulate a big increase in
 wool buying, the undertone is more
 confident and the softness of the last
 few weeks may disappear. Net
 changes in price have been small for
 some time. The pooled wools are
 fairly well cleaned up but some
 pools held over in private hands are
 being forced upon the market thru
 bank pressure. Advances on the
 new clips of western wool range from
 2 to 15 cents on the choicest sorts

READERS' OPINIONS

Stop, Look, Read and Think

Do you realize that you are unjustly affected by after the war conditions? That you have not been properly protected thru this period of readjustment. That everything has been done to reduce the cost of living regardless of whether the farmer sank or swam? You were urged into increasing production on your farms by being told that there would be an unlimited market to dispose of your surplus on the other side of the Atlantic. Then after your crops were harvested, your stock ready for market and your dairy products in storage you were told that your market across the ocean would be limited on account of the financial condition of our prospective buyers.

Do you suppose that these conditions were unforeseen? Were you protected against outside opposition by a reasonable protective tariff on your products? Now I can see no reason why we should let other nations who produce under different conditions regarding the price of labor and other important items set our prices on farm products any more than we should let them do so on manufactured products. It is my opinion that we should keep up our standards by protecting all our industries including agriculture with a reasonable protective tariff. Agriculture is the backbone of the nation and cannot be carried on successfully without protection any more than any other industry. And it certainly is no worse to place a tariff on products which we can produce than on those which we are compelled to buy from other countries.

Do you realize that the importation of wheat, potatoes and dairy products from Canada, and of hides and meats from South America, and the importation of other products from these and other countries affect your prices? Are you satisfied with your conditions? If not take the matter up with your legislators in Washington. The present administration promised us before election that it would do something to help the farmers thru this period of readjustment, and now it is up to us to see that they live up to their promise.

Sit down at once and write to your Congressman and Senators and ask them to use their influence and vote towards placing a protective tariff on your products equal to that which is on products which you have to buy. Don't put it off. Write today. Tomorrow may find you occupied with other thoughts and matters of importance, and this being of great importance to you should not be neglected. — Gideon T. Williamme, Tioga Co., Pa.

A HOME FOR RURAL TEACHERS

Having taught eighteen terms in rural schools and having spent my whole life in the country, I am vitally interested in country boys and girls. It is at the risk of seeming behind the times that I advance the opinion that the problem of rural education will never be solved wholly by consolidation. Any one who thinks it will, should spend a winter in old Chataqua County. After encountering some of our New York state blizzards long distance transportation would seem vastly more complicated.

Perhaps no one but teachers realize just how important is a home for

the woman who teaches the country school. I believe that eventually the rural "teacherage" will hold a place in the solution of the present problem equal to, if not greater than the consolidated school. It is unthinkable that country schools will ever be wholly abandoned and many sections that have been consolidated have been forced to establish branch schools in the rural districts. In such cases there is still a homeless woman to be provided for and many farm homes are so situated that it is impossible to make her at all comfortable in them. My own is one of these. We had a dear little teacher in our district a few winters ago who came near not being able to find a place to stay. Being a former pupil of mine, I was especially anxious to offer her a home but it was impossible; I had more work than I could do without anything extra, even if I had had ample room which I did not.

At present I am teaching my seventh term in my little school here and I am living with a woman with whom I used to stay some years ago. I realize that I am very fortunate in being so well cared for but she will not live always and a "teacherage" here would be highly desirable altho many districts need one far worse. Perhaps this would mean added expense but not to so great an extent as most people imagine. Under the present system the wage must be sufficient to cover a board bill which, in some cases, is certainly exorbitant.

At first thought not all advantages of the "teacherage" will be evident but really they are almost innumerable. If a home were assured better teachers would be more easily secured, and any teacher could be a far better and more useful one if she lived in a home of her own, right on the premises. How I have longed for a home within reach of my pupils where I might be perfectly free to invite them for evening parties and holiday festivities! A place where they would annoy no one and where I might bring them just as often as I wished! It is quite desirable in these days, too, that the school property be not left entirely unguarded so much of the time as it is at present.

No matter how good the social life of the community may be a "teacherage" could not but prove valuable and enjoyable to the boys and girls and in many places there is a dearth of good times for young people of school age.—Mrs. E. M. A. Chataqua County, N. Y.

DAYLIGHT SAVING

Now that Daylight Saving has taken the same grave as John Barley-corn I feel that it is the duty of all good thinking and law abiding citizens to bestow their gratefulness upon those men who voted down that act of insanity. We thank the 142 men who cast votes against it in the Legislature.—J. B. Pihla, Co., Pa.

County Note

Union Co., Pa.—Oats seeding will be finished soon and the usual acreage will be sown. Much seed has been plowed for corn which will be planted soon after May first. Some farmers are hauling manure on soil for corn. Efforts are being made to have our farmers plant largely of one or two varieties of corn after having found the varieties which yield best in the county. Some farmers treated oats seed to prevent smut, and demonstrations to show how this can be done were given at several farm sales.—J. N. Glover.

A help to good cooking

When you work with a range that's dependable, a range that cooks slowly or quickly, just as you want, half your cooking worries are ended. A Beechwood is exactly that sort of range. It is always under control. A Beechwood never balks.

Beechwood

The Beechwood Duplex Grate gives a clear, hot fire without delay. The polished top and enameled sides are kept spotless and shining simply by wiping. Three colors, blue, brown and gray.

Full details in our folder. Write for it. The Quakertown Stove Works Quakertown, Pa.

COMBAULT'S CAUSTIC BALSAM

The Perfect Liniment For External Use on The Human Body

It is astonishing how quickly Caustic Balsam relieves Stiffness and Lameness, Rheumatism, Neuralgia, Strains, Sprains, Lumbago, Backache, Sore Throat, Chest Cold, Stiff Joints, etc.

Serious results through Blood Poisoning are liable from scratches, cuts or wounds from rusty nails or other metal. This great remedy applied at once will prove a preventive, is a perfect antiseptic, soothes while it heals. What it has done for others it will do for you.

Write us for any information desired. \$1.75 per bottle at druggists or sent parcel post on receipt of price. THE LAWRENCE-WILLIAMS CO. Cleveland, Ohio

BARGAINS IN U.S. ARMY GOODS

Army shoes, boots, shirts, breeches, leggings, tents, cots, blankets, etc. For complete list and price write to Dept. K, Box 1835, Richmond, Va., for this catalogue. IF THE ARMY USES IT WE HAVE IT! THE ARMY-Navy Supply Co. RICHMOND, VA.

WITTE 2 H.P. Pumps

Big Value—Big Surplus power. Immediate shipment. Offer includes engine on main—ready to go. From Pittsburgh address. \$39.95 F.O.B. E.C. WITTE ENGINE WORKS 2241 Oakland Ave. Kansas City, Mo. 2241 Locust St. Pittsburgh, Pa. Export Catalog FREE

LIGHTNING RODS

Exclusive agency and retail sales to Life Dealers and "LIFE" BUILDERS. Our copper rods are 100% PURE. Write for agency. Prices are 100% L. L. DODGE CO., Marshfield, Wis.

Try This Mixer—30 Days FREE

RIGHT now is the time to get your KWIK-MIX Concrete Mixer—Special Easy Payment—Offer and reduced prices for this month only.

Before you buy any concrete mixer or start mixing with a shovel, let me send you the wonderful KWIK-MIX Concrete Mixer on 30 days' free trial. Test yourself on latest, most up-to-date mixer before you go ahead. Don't take chances mixing a job with hand-mixed concrete. Get a KWIK-MIX and be sure of a perfect mix, faster time, larger quantities, perfect—pay for itself on first job. The original concrete mixer—built from one side—close up to fill of material—dumped folded mixture other side into wheelbarrow or directly into form. This new improvement saves a great amount of time and labor—KWIK-MIX costs less than the ordinary mixer. Great freedom—built to last—hard-wearing—easy to mix. Capacity, three cubic feet a minute—hand or foot power—fully guaranteed.

BADGER WIRE & IRON WORKS 1011 Cleveland Ave., Milwaukee, Wis.

PENNSYLVANIA FOR GRAIN DRILL SERVICE

Here is a compact outfit that sows all kinds of grain and fertilizer with minute accuracy. Quantities regulated by levers convenient to operator. Grass seeder either in front or behind opener, as desired. Low down construction throughout with hopper always in balance.

The Pennsylvania is built in sizes 8 to 12 tubes with choice of Pin Hoe, Spring Hoe or Single Disc openers. Special Drill Catalogue fully explaining efficient seeding mailed on request.

A. B. FARQUHAR CO., Ltd., Box 346, York, Pa.

Also Engines and Boilers, Sawmills, Thrashers, Potato Diggers. Write for description.

Positive Force Feeds Chain Driven Gears Accurate Seeding

The Pennsylvania Bureau of Markets

One of the Service Bureaus of the State Department of Agriculture

By J. C. GILBERT
Acting Director.

BUREAUS OF MARKETS are of comparatively recent origin. Government assistance to agriculture until within the past few years has been confined to what may be called production work.

The present U. S. Bureau of Markets was organized by an act of Congress in May, 1913, as the Office of Markets to which the following year was added "Rural Organizations".

In Pennsylvania the first attempt on the part of the Department of Agriculture along marketing lines was embodied in an act of the Legislature, approved July 17, 1917, providing for the establishment of a Bureau of Markets in that Department.

When the Department of Agriculture was reorganized by an act of the Legislature, approved May 8, 1919, provision was made for a Bureau of Markets and its powers and duties were outlined in brief form.

On July 9, 1919, a Bureau of Markets Act was duly approved which is fully consistent with the outline in the act reorganizing the department.

Under this later act which repealed both the former acts mentioned, the bureau is now being conducted.

The following are listed as powers of the bureau:

- 1—Investigation of marketing farm products including the costs of marketing.
- 2—The gathering and distribution of information on supply, demand, prevailing prices, commercial movement of farm products including quantities in common and cold storage.
- 3—Assisting in organizing and conducting public markets, and co-operative and other associations of producers, distributors and consumers.
- 4—Investigation of transportation and storage conditions affecting the marketing of farm products.
- 5—To take such lawful steps as may be deemed necessary to prevent waste of perishable products.
- 6—In co-operation with the Bureau of Standards of the Department of Internal Affairs may establish standard containers for farm products.
- 7—Establish and promulgate grades and standards for farm products and certify that shipments comply with established standards.

The reader can readily see that the powers of the bureau are broad and that its work covers practically all phases of the handling of farm products. Farm Product is defined as: "any agricultural or horticultural product, any fresh or salt water food product, or any product designed for food or feed purposes manufactured or prepared principally from any agricultural or horticultural product or products".

Taking up the outline given in the law let us see what the bureau is doing:

General Investigations

A realization of the growing importance of the co-operative association movement was followed by an investigation of the situation of this state. Bulletin No. 341 "Farmers' Co-operative Associations in Pennsylvania" was written to give to the farmers of the state the essential facts concerning co-operation.

The public markets of the state have been surveyed and the results will be published in a bulletin now being prepared. This survey shows some examples of very faulty local distribution. There are some public markets that seem to be functioning efficiently. The features of these which stand out as particularly noteworthy will be discussed in the forthcoming bulletin.

Under the head of investigations the bureau has co-operated with State College in making surveys of the apple and vegetable industries of the state. The data collected is already showing that much needs to be done to improve the marketing of our fruit and vegetables. One of the points brought out prominently is the need

for standardization of packages used in commercial handling as well as the need for standardization of grades and methods of packing.

Market Reporting Service

Perhaps the most outstanding feature of the work of the bureau is its Market Reporting Service.

This service has eight branch offices and a central supervising office at Harrisburg which also operates as a distributing center. The branches are located at York, Lancaster, Allentown, Easton, Scranton, Wilkes-Barre, Erie and Pittsburgh.

The work of the branch offices is the collection and distribution of local, state and national market news and reports.

By a co-operative arrangement with the U. S. Bureau of Markets loops off the government leased telegraphic system are extended to the Lancaster branch offices. At Pittsburgh the United States and Pennsylvania bureaus have a joint arrangement. The western circuit of the United States bureau's telegraph passes thru that office.

In these offices telegraphers take from the wire each day reports of the movement, supply, demand and current prices of the principal farm products from the important producing sections and the large consuming markets. These reports

the weekly papers. Any one desiring any of the reports by telegraph can secure them by paying the telegraph charges.

The Lancaster branch office offers an example of the kind of service which the bureau can render the public. At Lancaster is located an important livestock yard which handles a very large percentage of the stock fed by the farmers of Lancaster and surrounding counties. The most important work of the reporter at Lancaster is reporting the livestock market at the yards.

This work has been done so well that the Livestock Exchange uses the reports of the bureau representative as its official figures. The farmers know that the reports printed in their local papers are correct. The U. S. Bureau of Markets at one time had a reporter at the Lancaster market but was compelled by lack of resources to discontinue. Now the United States Bureau of Markets uses the reports of the Pennsylvania Bureau of Markets. They consider the arrangement so satisfactory that plans for its continuance are being made at this time.

(To be Continued.)

HINTS FOR FLY FIGHTERS

The ant is said to be more numerous than any other animal but in the section of country where the Pennsylvania Farmer circulates no other animal causes as much annoyance and trouble as the house fly, though some parts of New Jersey may give first place to the mosquito. In the good old summertime every good housewife traps it, poisons it and swats it; then she swats it, poisons it and traps it, and still it comes. Finally zero sweeps down upon us and then it crawls away into the crevices and holes of the buildings and walls, there to await the time when balmy breezes come again. The winter retreat becomes a tomb for most of them but many survive, to emerge and begin again the renewal of their race.

Multiplication is very rapid with them and did they have no enemies but the good housewife, she would find herself overwhelmed with an avalanche of them long before the frosts of autumn came to her relief. The dozen or two about your house in April become thousands in June, millions in August. Therefore it is very important to kill the dozen or

two in April and to keep after them during May. They will breed in almost any filthy place. It is claimed that ninety per cent of them come from in and around horse stables. Having been born in filth the fly seeks out and thrives in filthy places. Especially does it delight in the wastes thrown out from dysenteric and typhoid cases. Having loaded itself from these places it will go, with malice great towards the human kind, to the lips and face of the babe in the cradle, to your plate, to your milk pitcher, to your butter plate; leaving there for your appetite the load of disease germs it has acquired. No agency in nature is better adapted to transport freight of this kind. Do you wonder that it is called the typhoid fly? Suppose some tubercular person expectorates near your home. Before he is out of sight the fly is there and soon tries to share his find with you. This is not nice talk but one cannot use nice talk when discussing flies any more than he can if discussing the Russian Bolsheviks.

If you have read this far you might be interested in knowing what to do to get rid of some of them. You can do nothing, I think, to completely rid your premises of them though I have read that large sections of country in England are absolutely free from flies as a result of half a century or so of fly fighting by all the people.

Were I to take a week off to lead in a campaign against flies I would say "we will begin in the cellar." Clean out thoroughly all decayed vegetables and trash. Then clean it again and scatter lime freely for probably some places have been

(Continued to Page 9.)

This Truck Does the Retail Marketing for a New Jersey Community

are sent to all the other branch offices daily from the Harrisburg office together with reviews of conditions in the markets and shipping sections of the state. The local reports in each district consist of daily reviews of both wholesale and retail prices and conditions.

In planning this reporting service about a year ago the plan for distribution for the market information gave the bureau much concern. Having only a limited amount of funds available it seemed impossible to develop a general mailing system from the branch offices for not only would this call for extensive supplies, duplicating equipment, addressing machines and postage but a large force of clerks to handle the work.

The service was offered to the newspapers and almost without exception they welcomed the idea of having the reports for their columns. The branch office men prepare only enough copies of the reports for the newspapers in their districts and all requests for market information are answered by naming the papers in the locality of the inquirer which carry the reports.

At the present time the circulation of the papers in each reporting district will total between 75,000 and 100,000 which means that the reports have a circulation of between one half and three-quarters of a million each week.

In addition to the regular reports special marketing information is sent to the newspapers including embargo notices, cold storage reports and other information of interest to growers and handlers of farm products. Weekly reviews of conditions, state and national, are prepared for

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

POTATO FIELD

I plowed over two acres of sod this spring, and intend to raise potatoes. The soil is good, sandy loam, and I will not use any fertilizer until plants are about six inches high. I contemplate applying a 3-10-2 commercial fertilizer on side of plants, then covering up with hoe. Is that a good method? In the case of tomatoes, it worked wonders.—A. M. Morris Co., N. J.

Potato Field.—Delayed applications of commercial fertilizer have certain advantages as well as certain disadvantages. The advantages lie in the fact that the soluble chemicals, making up the bulk of the present day commercial fertilizer, may injure the young plants and that they may be partly leached out of the soil before the crop is ready to use them. On the other hand, commercial fertilizer, properly used at planting time, stimulates seed germination, encourages bacterial activities and makes possible the more regular feeding of the crop during the fore part of the growing season. Something should be said also about the saving of time and labor when the fertilizer is used at planting time.

The best practice must be determined by the nature of the crop, the soil, and of the rainfall in any particular locality. Some crops are more readily injured than others by a strong solution of salts in the soil moisture. Lighter soils offer more danger in this connection than do heavier soils. Where the rainfall is heavy in the spring and early summer a considerable proportion of the fertilizer nitrogen may be lost. All told, potatoes should do fully as well when the fertilizer is applied in the row at planting time provided the total amount does not exceed 1200-1500 lbs. per acre. Beyond that it would be safer to divide the applications. In some of the potato growing sections where large quantities of fertilizer are used up to 2500 and 3000 lbs. per acre only a portion of it is used in the row at planting time, the rest is used as a side dressing. The potato growers in Europe appreciate this fact and practice side dressing whenever the appearance of the crop indicates that it is not being supplied fast enough with readily available plant food.

THE USE OF COMMON SALT ON LAND

Editor's Note.—A well-known agricultural authority recently questioned the advisability of using salt on land as mentioned by Dr. Lipman in answer to a query in the March 26th issue of the Pennsylvania Farmer. The matter was referred to Dr. Lipman who has prepared the following article giving the views of some prominent students of soil problems and citing the results of experimental work on the subject.

The question raised is a legitimate one, for the use of salt has its dangers, as was pointed out by the writer in the issue of the Pennsylvania Farmer of March 26. Indeed, the Old World farmers long ago recognized the uses and abuses of salt. The situation is aptly described by an English writer, Aikman, in his book *Manures and Manuring*, published in 1894. He says (p. 465) "Despite, however, the great antiquity of its use, much difference of opinion seems always to have existed as to the exact method of its action, and as to its merits as a manure in promoting vegetable growth. It furnishes, in fact, a good example of the difficulty which exists in the case of many manures, whose action is chiefly indirect, of fully understanding their influence on the soil and on the crop. In fact, the action of salt is probably more complicated than that of any other manurial substances." He tells us further (p. 469) that: "While, therefore, its unfavorable action has long been known, the fact that there are circumstances under which its action is, on the contrary, favorable for promoting

growth has also been long recognized. The difficulty for the agricultural student is to reconcile these two seemingly contradictory experiences. For the English agriculturist the subject possesses especial interest, since in England it has been in the past most generally used and its action most discussed since the time of Lord Bacon, who discusses in his writings the action of solutions of it on different plants. * * * Its action has been found to be most favorable when applied along with other manures and not alone. Applied along with nitrate of soda, as is commonly done, it doubtless increases the efficiency of the nitrate. Some plants seem to be undoubtedly benefited by salt; of these flax may be mentioned. The application of salt to plants of the cabbage tribe seems also to be highly beneficial. On mangels, along with other manures, it has also been found to have a very favorable effect. But with many crops its action has been proved to be less favorable. * * * Lastly, the rate at which it may be applied will naturally vary. From one cwt. and even less, up to six cwt. or even more, has been the rate at which it has been commonly applied in the past. From what has been said, it will be seen that it is more likely to exert a favorable influence when applied only in small quantities."

Storer; one of the old American authorities on soils and fertilizers, tells us (*Agriculture*, edition of 1889, Vol. II, p. 16) "Until a comparatively recent period it was impossible to comprehend the conflicting statements about the use of common salt that were published every day. One farmer found it a valuable manure; a large number of observers, perhaps the majority, could not per-

An Attractive Group of Farm Buildings

ceive that they derived either benefit or damage from its use. * * * It has often been noticed, even in localities where salt has been found to do good service as a fertilizing agent when ploughed under, that top-dressings of it seldom increase the crops, and that they were often distinctly hurtful. One case has been reported where 9 cwt. of salt strewn upon a Saxon acre had no visible action upon either wheat or rye, while it killed young clover. In general, it is agreed that care must be taken to use salt sparingly, and to apply it at appropriate seasons, as when neither seeds, nor sprouts, nor young plants are at hand to be injured. Instances are on record where more than 3 cwt. to the Saxon acre diminished the beet crop, and more than 4½ cwt. diminished the yield of potatoes. In some places 1 or 2 cwt. to the Saxon acre, applied to rye, gave the best results, while in other situations the best rye crop was got with 6 cwt. In this instance, an application of 9 cwt. diminished the crop and 12 cwt. lessened it still more. A barrel of salt to the acre, for wheat, is one English formula. Quoting from American experience Storer goes on to say that market gardeners in the vicinity of Boston have found salt of advantage to cabbages, cauliflowers, tomatoes, celery, horseradish and onions. Its action on melons was, on the other hand, at all times injurious. He also quotes a southern planter to the effect that: "Salt makes cotton bear longer in the season, and stand drought better; it increases the quantity and improves the quality. It acts equally well on corn, oats and other grains, and it toughens wheat straw so that there is less waste from ears breaking off when the crop is cut."

A more recent American authority (Wheeler, *Manures and Fertilizers*, 1913) states that: "The old and modern writers on agricultural chemistry

and on general agriculture agree that marked benefit to farm crops often follows the application of sodium salts, though reference is commonly made to sodium chloride (common salt). * * * The general recognition in Great Britain of the benefit from the application of common salt to soils is evident from the statement by Griffiths to the effect that 250,000 tons of finely crushed common salt are used for manurial purposes in the United Kingdom." Experiments carried out under Wheeler's direction at Kingston, Rhode Island, showed marked benefits from the use of common salt, especially in the case of mangels, radishes, turnips, and a number of other crops. Similarly, on the very sandy soil of the experiment station farm at Woburn, England, salt used as a top-dressing on mangels gave better results than did barnyard manure. The best results were obtained from a mixture of 1 cwt. of nitrate of soda and 1 cwt. of common salt per acre. Experiments with sugar beets carried out in Austria in 1909 showed that when common salt was used at the rate of 160 pounds per acre there was not only a marked increase in yield, but also a higher content of sugar in the juice.

The scarcity of potash during the war led many American investigators to recommend the use of small applications of common salt as a means of liberating a greater amount of soluble potash from the soils. Such recommendations were based largely on the favorable results obtained at the experiment stations of Rhode Island, Massachusetts and Maine. Lack of space will not permit the discussion of these experiments at any length. It would be worth while, however, to refer to the conclusions reached by the Maine Experiment Station after a series of investigations covering the period 1915-1918. In Bulletin 277 of that station the author states that: "The addition of 300 pounds of common salt per acre made a small but uniform increase in yield. Omitting the yields for 1915 in which there was no salt plot, the average yield for the plots without potash or salt was 140 hundredweight and for the plots without potash but with common salt added the yields averaged 151 hundredweight."

As to the use of large quantities of salt for the destruction of weeds, also on this point there is much interesting and definite information. For instance, many years of experience have led Blackman to say (*Breeders Gazette*, Vol. 64, p. 311) that applications of salt while the plants are wet with dew or rain will kill Canada thistles both in pastures and cultivated fields. In the same manner we are told by Jones (Vermont Station Report, 1900, pp. 282-286) that: "Salt is the best chemical yet tried for killing the orange hawkweed and when properly used it is entirely effective." Many more experiments and observations of a like manner could be quoted that common salt when intelligently used is a certain means of suppressing the growth of certain weeds. Without going too far afield the writer could refer again to the experimental evidence gathered in New Jersey during the seasons of 1919 and 1920. The experiments in question were carried out on a very extensive scale in Burlington County for the purpose of determining the best methods for the complete destruction of roadside vegetation. The conclusions reached may be summarized as follows: As a rule, 5 to 6 tons per acre are effective if conditions are favorable, that is, when applications are made on a rainy day or when rains occur within a few days, and when all vegetation is cut. Eight tons of agricultural salt will kill all vegetation, except asparagus. For most weeds smaller applications were quite effective. The plant growth observed in these experiments included pigweed, orach, ragweed, asparagus, dandelion, wild strawberry, hawkweed, knot grass, ferns, hardy grasses, poison ivy, five-leaved ivy, sassafras, oak, wild cherry, wild grape, hackberry, blackberry, elderberry, raspberry and ash.—J. G. Lipman.

Does it seem an idle thing,
A pleasant word to speak?
The face you wear, the thought you bring,
A heart may heal or break.

—Whittier.

Save Your Grain Profits

IT is the last few bushels you get from an acre that give you a profit. You can easily lose those profit-making bushels by shelling out or sprouting after the grain is ripe.

THE HUBER JUNIOR THRESHER

will protect you. You can thresh when your grain is just right and save and sell all of it. Your tractor supplies the power. Your own help does the work. You need not exchange labor at inconvenient times. Your wife has no big threshing crew to feed.

The grain you save—and the threshing bills—soon pay for your Huber Jr., if you thresh for a few of your neighbors the machine should pay for itself the first year.

The Prices are attractive. Terms if desired.

FARQUHAR ECONOMICAL POWER

Here is a truly general purpose farm engine, built in sizes 5 to 50 H. P. Furnishes dependable power with minimum operating expense and up-keep. We also build the famous wood burner—Farquhar Cornish—as well as a complete line of Steam and Gas Tractors.

When in need of efficient power, consult us.

A. B. FARQUHAR CO., Ltd. YORK, PA.
Box 446

Other Farquhar Tools: Saw Mills, Threshers, Potato Diggers, Grain Drills, Cultivators, Hydraulic Cider Presses. Ask for catalogue.

Reading Bone Fertilizer

Quality Service Satisfaction

Service—We have helped with honest advice hundreds of farmers in the East. We might be able to help you. Write us—no obligations whatever.

(This trade mark means quality)

Reading Bone Fertilizer Co., Reading, Pa.

WITTE 2 H-P. Pumps 2 1/2 H-P. Pumps

Big Value—Big Savings power. Immediate shipment. Offer includes engine and pump. Price \$39.95. Write for catalogue. WITTE ENGINE WORKS, 1992 2nd Ave., Kansas City, Mo. 64104. 28-2, Centre Bldg., Pittsburgh, Pa.

Use Lime It Pays

Last year it was increased production—this year it's reduced production costs.

PALMER'S LIME Reduces Costs

by correcting acidity at minimum cost—nothing else will do it. Not one farm in ten has enough lime, and this lack of lime reduces the effectiveness of fertilizer and tillage and reduces production which increases production cost.

Palmer Lime is prepared for every use. It will pay you to use it.

Agents wanted everywhere. Write for prices and pamphlets.

Light and Power Problems

By A. G. CRUIKSHANK

A NOTED ENGINEER is authority for the statement that 99 per cent of the battery and ignition trouble experienced by the users of storage batteries in automobiles or farm lighting plants, is due to carelessness and negligence on the part of the owners. The battery is a vital part of a lighting plant, and should be given proper care and attention by the user.

A rundown battery is usually due to the fact that the battery has been literally starved, and has not been properly charged and maintained.

Form the habit of inspecting the battery at frequent intervals—at least, twice a week. This can be easily done in a few minutes, and will save a great deal of trouble.

The solution in the battery jars is called electrolyte, and consists of a mixture of acid and distilled water. There is a gradual evaporation of the water, which should be replaced, always using only distilled water, which may be bought at any drug store or ice manufacturing plant, at small cost.

Do not under any circumstances use what is commonly called hard water, or any water known to contain even small quantities of salt, alkali, iron, acid, etc., such as ordinary drinking water and river water.

The solution should always be kept at a point above the tops of the plates and to place the distilled water in the jars that will bring the electrolyte or solution to the proper heights, it is only necessary to remove the vent plug and after the distilled water has been poured into the jars, to replace the vent plug.

Before adding water, what is called a specific gravity test should be made of the solution in the jars, and for this purpose an instrument called a hydrometer is used. To use the hydrometer, remove the vent plug, immerse the rubber hose on the end of the hydrometer in the solution, squeeze the rubber bulb on the end of the hydrometer to expel air, and release the bulb while the rubber hose end is still immersed in the solution. This will cause some of the solution to be sucked up into the hydrometer casing, and the indicator inside of the casing will float in the solution. The specific gravity of the solution will govern the height at which the indicator floats.

You will note a scale of numbers on this indicator, and if No. 1.275 is level with the top of the liquid in the hydrometer casing, it indicates that the battery is fully charged.

A reading below 1.200, but above 1.150, indicates that the battery is less than half charged. If the battery is found to be less than half charged, it is advisable to immediately recharge it.

An exhausted battery is always a result of insufficient charging or wasted current, and if after having been fully charged, the battery is soon again exhausted, there is trouble somewhere in the wiring system, or too many lamps are connected, and an immediate investigation should be made, and the trouble corrected. Never put acid into the battery jars, as it can do no good, and may do great harm.

The hydrometer reading of fully charged battery jars is about 1.275, and the charge is completed when the charging current flows at a low rate, all jars are bubbling freely and evenly, and the hydrometer reading shows no further rise during one hour. The figures given in this paragraph, in regard to hydrometer reading of batteries, are average figures only. In some cases batteries are fully charged at reading below 1.275, and in some cases at readings above 1.275.

As before mentioned, the hydrometer is an instrument that is used to determine specific gravity, and the specific gravity of water is 1.000, and water freezes at 32 deg. Fahrenheit above zero. When the battery is fully charged, it will not freeze, but should be located in a cold place, and be

partly charged, the water in the solution will freeze and destroy the battery. The following is a summary of conditions of batteries, in relation to different freezing points:

Hydrometer Reading—1.160, battery 1 discharged, freezing temperature zero Fahrenheit.

Hydrometer Reading—1.210, battery 1 discharged, freezing temperature 20 deg. Fahrenheit below zero.

Hydrometer Reading—1.260, battery 1 discharged, freezing temperature 60 deg. Fahrenheit below zero.

Keep the following items in mind:

1—Inspect the battery frequently.

2—The solution in the jars should never get below the top of the plates.

3—Use only distilled water in refilling jars.

4—Always test the jars before refilling, and return the solution to the same jar from which it is drawn.

5—Keep the battery as near fully charged as possible. This can be determined by hydrometer reading.

6—Battery will not freeze in the winter if kept fully charged.

7—If in doubt about any point regarding the care of the battery, get in touch immediately with the plant service man, or with an experienced battery man.

Mr. H. E. More, of New Jersey, writes: "When the batteries are being charged, how can one tell from the appearance when they are fully charged?"

They gas or bubble freely and have a milky appearance. Unless the charging rate is excessively high, causing a very high temperature in the battery, it is safe to assume that when a cell bubbles, has a milky appearance, or gases freely, it is fully charged. After the batteries have cooled and settled they should be checked with the hydrometer for the specific gravity reading, if there is any doubt whether they are fully charged.

Farmer H. A. R. inquires: "What does the electrolyte consist of? I have all sorts of instructions on what to do and what not to do, but would like to know what is in the electrolyte."

The electrolyte, consisting of a mixture of pure sulphuric acid and distilled water, should indicate a specific gravity of 1.200 on the ordinary specific gravity hydrometer, or about 24 Baume scale. This solution should be mixed in stone jars in about the proportion of 41 parts water to one of concentrated sulphuric acid, by volume, pouring the acid into the water. River and well water usually contain impurities and should be avoided, as the least quantity of chlorine or ammoniacal salts present in the electrolyte will seriously affect the life of the plates.

Remember that boiled water is not distilled water. Distilled water really is the steam from boiled water, condensed.

R. E. D. writes: "I have a garage. What size air compressor can I use with a 1 1/2 K. W. farm lighting plant?"

The size compressor, which can be used to best advantage with a 1 1/2 K. W. plant has a bore from 2 1/2 to 3 inches and a stroke of from 3 to 4 inches. The speed of this compressor is about 200 to 300 R. P. M. and a power required is from 1 horse to 1 horse. It should operate to a counter shaft with a tight and loose pulley.

Farmer Edward Smith asks: "What does R. P. M. mean?"

P. M. means revolutions per minute.

In the hour of danger keep firm control of yourself, that you may devote all your energies to the problem of meeting the urgent need.

To Drive Rats and Flies Away—Scatter dry chloride of lime around and into rat holes. Most rodents and insects flee from it; rats will leave at once.

The National Organization of Farmers

By FRANK APP, New Jersey

(Concluded From Last Week).

WE NEED agricultural consultants abroad which should be government employees. The nation desires a guaranteed supply of food and this can only be obtained by having a surplus of food to sell. Some years the crop is short. A guaranteed supply means that the short year should be enough for normal consumption while the abundant years will need to have an additional market. This can be found in our foreign markets and should be cared for by agricultural consultants whose responsibility is to promote the marketing of agricultural products abroad.

Such legislation will be obtained only by the farmers formulating, planning and placing before Congress the reasons as well as the need for such action. They need to employ men who can present the facts for agriculture to the members of Congress. They must be skillful enough to meet the opposition of other interests in a friendly way. After all, it is a question of deciding to what extent the movement will influence the nation as a whole. As individuals, we are all inclined to be human and selfish, to see our own view point first. However, if we place the facts before the public showing that our desires and needs are also of benefit to the public, then we can usually get what is just.

The United States has a war debt of \$24,000,000,000. If this is paid for in proportion to the wealth of the different interests, it means that the farmer should pay \$8,000,000,000. Based on the amount per farm, it would mean an average of \$1300 war debt for every farm in the United States as their share of the debt. Different interests will attempt to shift as much of this debt upon others as possible. Business will need to adjust this in such a way that it will be fair to all concerned. If the farmer is not properly represented, if he does not have the facts and data necessary, he must expect to bear a heavy burden which, quite likely, will be more than his share.

Education

Agriculture is greatly in need of better educational facilities, for those actively engaged in agriculture itself, for their children, and for the public, which is interested in agriculture in so far as it furnishes a safe and efficient source of food.

The general impression of the public press and consumer prevails that the farmer has been obtaining a large profit particularly during the war. They recall vividly the high prices of foodstuffs and feel that this reflects directly upon the increased profits the farmer has been getting. Most of the consumers have practically no knowledge of the expenses entailed in producing food or distributing food while those that have at one time lived on the farm recall the days when the cost of production was far less than at present and feel that the farmer must be making a large amount of money as he thinks only of the cost of yesterday while he compares the price of today with that of yesterday.

I have before me an editorial which I have taken from one of the leading Philadelphia papers in which the writer comments upon the large income the farmers have been receiving by taking figures from the crop reporter which show that crops have paid in 1920 \$486.10 per acre and, in 1919 \$874.51 per acre; cranberries, \$213.37 in 1920; tobacco, \$168.05; potatoes, \$127.51; cotton, \$35.14 in 1920 and \$60.62 in 1919 while corn paid \$20.93 in 1920 and \$38.39 in 1919. The writer of the editorial used these figures to show what a large income the farmer can receive from a few acres of land which are cropped with cranberries or tobacco or potatoes. He doesn't consider the cost of these returns. It would be just as appropriate to draw the attention to the large income which our exporters have made in 1920 when they exported over eight billions of dollars from this country, or it would be just as logical to call attention to the large profits the railroads have made dur-

ing the past year when their income was over six billion dollars when in fact their return on investment for 1920 was but .78 per cent. It is not gross receipts which an industry receives, but it is the gross receipts less expenses which makes for profit. The public has been feeling that the farmers' gross receipts represented his income and approximately his net returns. As a matter of fact the cost of growing an acre of potatoes in New Jersey in 1920 was approximately \$200, corn \$65, tomatoes \$135 and wheat \$50. Consequently, the farmer in many cases furnishes labor and land gratis and his return in 1920 amounted to nothing more than the cost of seed and fertilizer and in other cases he just about broke even while a few have made some money.

If we look at agriculture as an industry and take the most prosperous year the farmers have ever had, namely, the year 1919 when the total valuation of crops and livestock according to the United States Department of Agriculture was 25 billions of dollars we find that this is obtained by valuing the crops and livestock separately. The crops were fed to the livestock so that two values were placed upon some of the crops. Should we value the crops which are not fed to livestock as one source of income and the livestock as another source of income we should have a return in 1919 of approximately eighteen billions of dollars gross receipts. This would need to be divided up among six and a half million farms of the nation which would be a little less than \$3000 per farm. From these gross receipts we must deduct the wages the farmer paid his hired men, the seed which he used for growing and producing his crops, the fertilizer he purchased from the fertilizer manufacturer, the cost of his horse labor in tilling the crops and caring for the stock, the use of his machinery, and the upkeep of his buildings, rental of his land or interest on his investment since the farmer frequently must borrow money, together with taxes and upkeep of the farm itself. After all these items are deducted would anyone feel that the American farmer in 1919, the most prosperous year which the nation ever had, received too large a return for his share of the prosperity of the nation? His average return was not above that of the ordinary laborer. It is true that a few of the farmers have made money. Any industry which does not offer opportunities for a few to make more than a bare living will not be prosperous, would not attract anyone with initiative or ambition, would not make for a happy people, and would not allow the proper education and development of our civilized life.

Country Educational Facilities

The facilities for education in the country are not comparable to those in the city since the facilities for education have not been developed so efficiently and do not offer the same opportunities for children to acquire an education in the country as they do in the city. This will also work to the detriment of the rural districts until the matter can be adjusted. Probably one reason why we have not had better schools is due to the fact that agriculture has not been sufficiently prosperous to allow the laying of taxes sufficient to meet the needs of education. The country does not possess hospitals and places of amusement or an opportunity for social activities as does the city. The amount of money spent for these things is comparatively small compared to life in the city. This is one reason why life in the country is less desirable in the eyes of man than life in the city. It is frequently said by people who would like to live in the country and who enjoy the occupation of farming, that they must move to town so as to educate their children, that the life of isolation for the farmer is not conducive to happy living. These things can only be corrected when agriculture becomes prosperous enough to afford the community and the home more of the conveniences and opportunities.

(Continued to Page 24).

Ideal ARCOLA Heating Outfits

Babies and young children need warm homes. Protect their health and make them happy in a home that has even, hot water heat and give them a good start in life.

Keep the Boys and Girls on the Farm

WITH stove heat the farmer has no private life. The farm help, family and all must spend their winter evenings sitting in the one heated room around the stove. The farmer's daughter must entertain her company in the same room with the family and help.

But install an ARCOLA and heat all rooms with no more fuel than is needed to heat one with a stove. The help then may have their room, the family another and daughter may have a room to entertain her company and will not want to leave home to get the privileges that her girl friends enjoy who live in the city.

Reduced in Size and Cost

The ARCOLA is made on the same principle and with the same guarantee as our large IDEAL Hot Water Heating plants. The only difference is in the smaller size and lower cost of the outfit.

Lasts a Lifetime

The ARCOLA burns hard or soft coal, coke or wood. Never wears out or needs repair. Leaks no coal-gas—wastes no heat up the chimney. Absolutely safe—no fire risk! Running water not necessary as same water is used over and over again.

Ideal ARCOLA Heating Outfits are especially designed for small homes, new or old, with or without cellars, and are sold by heating contractors everywhere. Investigate today!

Find Out Today!

Write for catalog showing open views of ARCOLA-heated 4-5-6- or 7-room cottages, bungalows, flats, schools and small business buildings. The ideal heat for farm homes, ranch houses, chicken houses and central or colony hog houses.

Simple way of heating 3-room house with Ideal ARCOLA Heating outfit.

AMERICAN RADIATOR COMPANY

Dept. F-30, 816-822 S. Michigan Ave., Chicago. Sales Branches and Showrooms in All Large Cities

Makers of the world-famous IDEAL Boilers and AMERICAN Radiators

The Perfection Sprayer

The simplest, strongest and most powerful sprayer can be changed from horse to hand power without any trouble. Easy to work. Will spray upper and under side of leaf; mixture can be directed at any angle. Send for our new book—FREE—and see how you can increase your profits 25 to 50 per cent—how you can spray fifty acres of potatoes, cotton or vegetables in a day.

THOMAS PEPPER, SON & CO., Hightstown, New Jersey

OTTAWA

1-HIP FASTEST CUTTING LOG SAW. Fully equipped with all modern machinery. Laid down the work of a team of men. One man can operate it. 50 H.P. "Grand" saw. One day delivery. 10 Year Guarantee. Free book. Get new low factory direct price today.

OTTAWA MANUFACTURING CO., 2511 Wood St., OTTAWA, KANBAS.

PAINT \$1.25 PER Gallon

ORDER DIRECT FROM FACTORY

We will send you as many gallons as you want of equal quality red or brown BARN PAINT

upon receipt of remittance. We are paid in advance and can supply you with paint for any purpose. Tell us your wants and let us quote a low price. We can save you money by shipping direct from our factory.

AMALGAMATED PAINT CO., 373 WAYNE ST., Jersey City, N. J.

Factory: 373 WAYNE ST., Jersey City, N. J.

second hand. Large stocks

all sizes furnished with new threads and couplings

PIPE

SMITH NO. 22 BANNER
COMPRESSED AIR SPRAYER

Every Farm Needs It Daily—the Year Around

Sprays trees, shrubs, potatoes and field crops for insects and fungus; sprays stables, pig and poultry pens; barn yards for lice and vermin and for disinfecting. Also can be used for whitewashing stables, poultry houses and fences. It's handy too, for washing windows, buggies, autos and for spraying cattle.

This sprayer is sturdy; tank is made of heavy brass or galvanized iron; capacity 4 gallons. Pump is two inches in diameter, seamless brass; brass castings; nothing to rust, corrode or wear out. A few strokes and you have a strong pressure to deliver long-distance fine mist or coarse spray through the Automatic, Brass, Non-cloggable Nozzle. Does not waste liquids. Easily operated by man, woman or boy.

The No. 22 Banner is built for long, hard service. Be sure and ask your dealer for it by name.

If your dealer cannot supply you, write
D. B. SMITH & CO., Manufacturers
90 Genesee St., UTICA, N. Y.
On sale in New York City at No. 98 Chambers St.
We make 50 different styles and sizes of sprayers. If you are interested in smaller or larger sprayers send for catalog.

YOU CANNOT
Grow Potatoes
without killing the
potato bugs.

Hydroxide

will do this and will also repel
the flea beetle.

At the same time it prevents
blight and keeps your vines in a
healthy condition.

Since you must spray why not
use the best possible material
and accomplish the most at one
spraying?

HORTICULTURE

Some Effects of the Freeze

By J. P. STEWART

WE ARE NOW getting about far enough away from the big freezes of the latter part of March and early April to appraise their effects more accurately. At first it was supposed that practically all the varieties of fruit that were in blossom or nearly so at the time of the freezes were almost completely wiped out, while those that were not yet advanced to the pink stage, for example, had largely escaped. This separation left only the greater part of the apples and a few of the cherries, such as the Windsor and Montmorency, on the safer side.

This appraisal now seems to have been largely correct so far as the injured group was concerned, but the damage has reached over into the supposedly safer group much farther than was anticipated. This applies at least to the general region extending from the vicinity of Harrisburg, Pa., southward, and running indefinitely both eastward and westward of this point. This means that many of the varieties of apples, such as the York Imperial, which were not yet advanced to the pink stage even in the central blossom, at the time of the first and severest freeze, have proved to be injured much worse than expected, while some of the supposedly tenderer varieties, such as Stayman Winesap, Stark and Jonathan, which had reached the pink stage in many of their blossoms, apparently came thru the early freeze with less injury than at least some of us expected.

In the case of the Yorks and also of many other varieties, the freeze killed great numbers of the little flower stalks right at their bases, so that the entire blossom cluster is now drying up and dropping off without even attempting to bloom. Also many of the blossoms that went ahead and opened after the freeze are dead in the center so that nothing can be expected from them and even where the pistils are still good, very little if any of the pollen is still alive. There is also very extensive puckering and pocketing of the leaves and even killing of entire growing tips in many varieties that has doubtless been caused by the freezing as was noted in Western New York under similar conditions many years ago.

In our own orchard this year, the Starks, Jonathans, and Staymans, although considerably farther advanced than the Yorks and Ganos at the time of the first freeze, showed a much larger percentage of unopened blossoms than the latter after that freeze. The later freezes, however, practically wiped out the Staymans and also most of the others. In the Yorks, on the lower ground especially, it was often difficult to find a single live blossom bud even after the first freeze. In a large orchard over in our neighboring state on the east, however, we were agreeably surprised after the big freeze to find enough live buds to make a good crop under favorable conditions later, although the owner had given everything up, so far as this year's crop was concerned.

What the Fruit Growers Can Do
In the more northern territory—from Sunbury northward—so far as we have observed, the amount of damage from all the freezes, is apparently considerably less than in the area above mentioned, so the danger of a general shortage in the fruit crop with consequent exorbitant prices this year and with conditions reversed again next year for a repetition of the sad experiences of last fall, is less likely to occur than seemed probable at first. Even at the best, however, the financial loss to the fruit growers as a result of the abnormally early spring, with the subsequent natural frosts and freezes, has undoubtedly run into the mil-

lions of dollars, and this at a time when losses cannot be easily borne. With their fruit crops gone, various courses are open to the growers. One is to cut all operations to the minimum for this season and try to get over into another crop year with a minimum of expense. This is the course that is being followed in many cases, in one of which the working force on an eighty-acre tract of bearing orchard has been cut to one man and a team. This course, however, is only available to those who have been able to keep their orchards up to first-class condition. In the other cases, the absence of a crop offers an opportunity to get some of the unfinished matters brought up to standard, but whether the average grower will have sufficient foresight and grit to do this remains to be seen.

Other growers are turning into the vegetable field, in the hope that it is not already too crowded, and are planting chiefly potatoes, cabbage and tomatoes. In the latter crop, the production of green tomatoes which are wrapped and packed in carriers like Georgia peaches and sent South to ripen in transit has proved a rather profitable enterprise for some people in the past, and they are naturally going into it again on a big scale.

Unless the potato makes a big change in the market, however, the chances for even a reasonable profit in it are not very bright. With the remnants of last year's crop now selling at 35 cents a bushel to the farmer when the seed that produced it probably was worth around four dollars a bushel, it may be readily seen that some one has been losing money on his potatoes this year at least.

Handling the Brush after Pruning
In the absence of a crop of fruit, it is probable that many growers will take advantage of the opportunity to continue their pruning and renovation work farther in the growing season than usual. This always brings up the accompanying problem of what to do with the brush.

There are two general courses possible in solving the brush problem. One of these is to gather the brush by some of the various methods available and drag it out to some convenient spot to be burned, and the other is to take the fire to the brush by means of a brush burner. Of the two general methods, the latter is undoubtedly the most convenient and practical, if one has the necessary materials available to construct the burner.

To do this, a low, iron-wheeled truck is the best starting point, and on this a long iron bed of sheet iron is laid, with sides about two feet or thereabouts in height. This bed is frequently carried on three pieces of heavy gas pipe, of about the two-inch size, and this pipe is bent upward and attached to the fifth wheel in front in such a way that the outfit will turn short and still permit the general level of the bed to remain low. Old discarded automobile bodies will often furnish the sheet iron necessary for making the bed, which does not have to be such a fancy affair, but does need to be tight enough in the bottom to keep the coals from dropping out.

The fire is started in the center of the bed and the brush is added as the outfit is driven along the rows. After a good bed of coals is established, it will often hold under the ash covering for as long as a week, so that under ordinary circumstances no time need be lost in restarting the fire after any ordinary interruption in the work. Some care will of course be necessary to avoid making so large a fire or driving so close to the trees on the leeward side as to injure the trees, but the fact

that this type of outfit is in regular use in the citrus groves of the west and in big peach and apple plantings of some of our eastern states is sufficient evidence of its practicability.

If one prefers to gather his brush and haul it out to the fire, undoubtedly the most efficient method is with the aid of a big wooden-toothed rake of the hay-stacker type, which is drawn by two horses—one at each end of the rake. Such rakes are in considerable use in the large orchards of central and southern Jersey, and they have the special merit of requiring a minimum of hand labor in gathering the brush, which naturally makes them very rapid and relatively cheap in their operation.

The other common method of handling the brush is to attach a couple of logs to the front bolster of a wagon after properly wiring it down, then removing the hind axle and letting the logs drag. They are best fastened at the end with a crosspiece that will hold them about three feet apart, and a vertical rack of the desired height is set up along this crosspiece. One or two boards of lighter poles may be placed in between the two main poles, to enable it to hold the lighter brush better. This makes a very cheap and readily constructible outfit, but its operation is less economical than either of the others.

HINTS FOR FLY FIGHTERS

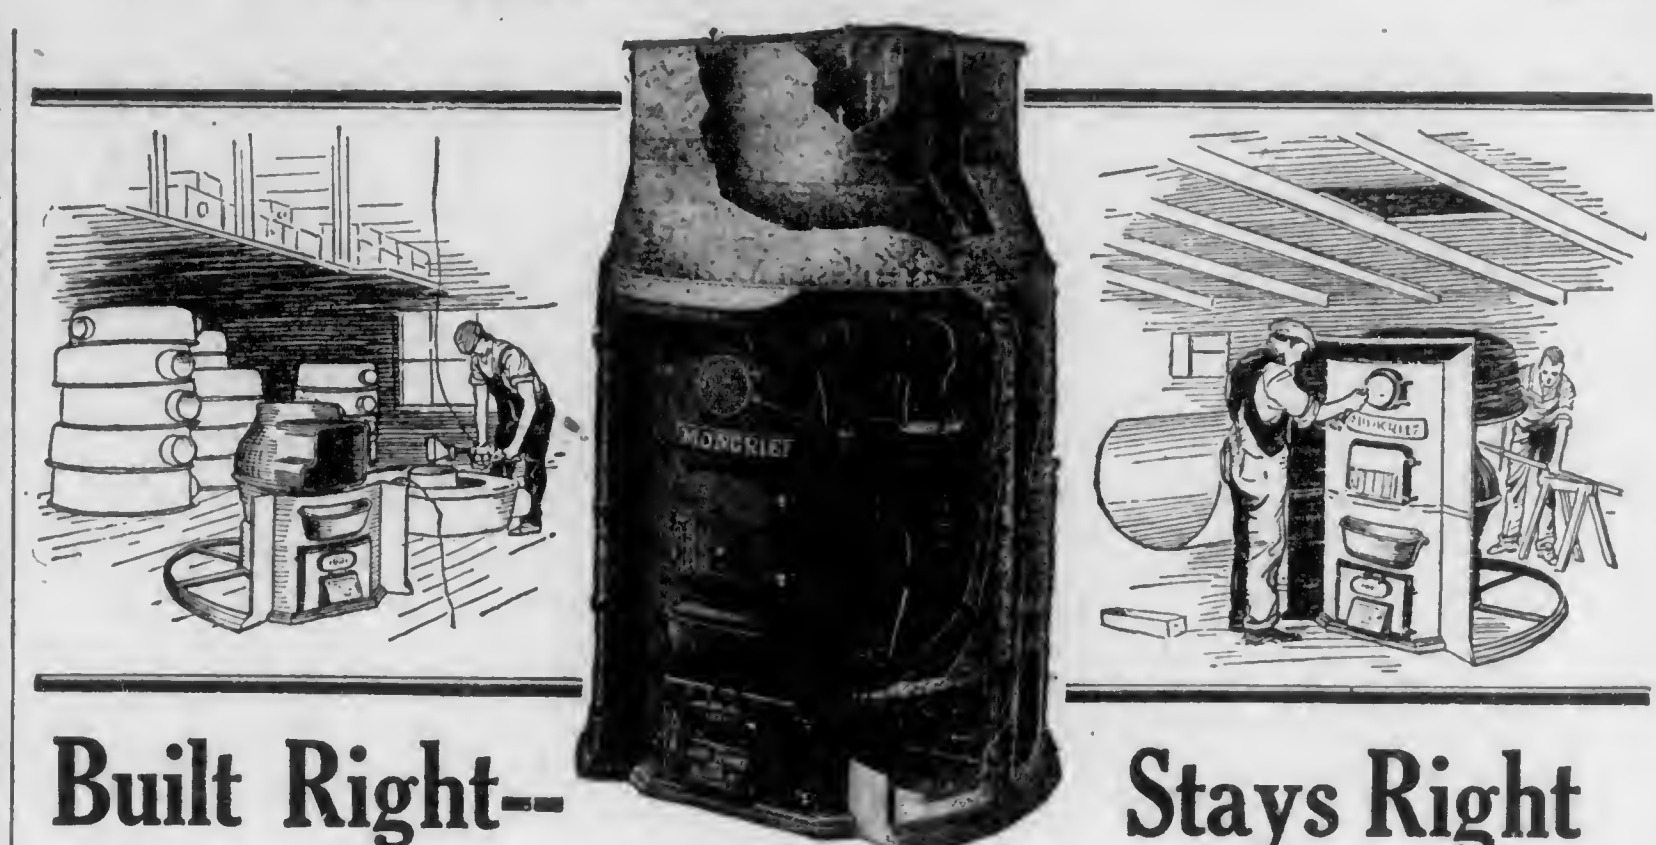

(Continued from Page 2).
left that flies delight in. Then screen all windows and doors into the cellar. Remove any decayed boards in the walks around the yard. Any damp spots in the yard fill with cinders, gravel or just clean dirt, if they cannot be easily drained. The next thing I mention I suppose no subscriber of the Pennsylvania Farmer will have, but I will mention it, as some neighbor may want to borrow your paper and they might have one. That thing is the slop hole right out by the kitchen door where all the slops, dishwater, etc., are thrown. How the flies do like that place, and for two reasons. First, it is very, very filthy. Second, it is right near the dining room table. Should any neighbor want to know of you how to get rid of that hole just tell him about the wonders of the septic tank. It is possible to get one installed.

Now with windows and doors screened, look for all the pails and utensils that have contained milk and fix them so no fly can get to them. Never leave a thing around that a fly can eat except poison. We will soon talk about the poison.

Being thru with the house and yard we will go to the other buildings. The hog pens must be removed far from the house and kept clean as possible. Chicken houses and stables must be made as clean as practicable and no piles of fertilizer left around them. Many places cannot be cleaned as thoroughly as they should to prevent fly breeding. Such places may be sprinkled with powdered borax and then with water. This is quite effective but must be repeated. In vaults use any kind of disinfecting material freely, such as copperas solution, chloride of lime, crude carbolic acid solution or even lye.

Keep fly poison where the flies can get to it at all times. Three teaspoonfuls of the concentrated solution of formaldehyde in one pint of water or three teaspoonfuls of the drug sodium salicylate (a fine white powder) in one pint of water make good poisons. Either of them flies like and they are better than preparations of arsenic to have around for they would be harmless should children get them. Put a little of the above preparations in saucers within reach of the flies. A mixture of equal parts by measure of cream, ground black pepper and brown sugar is poisonous to them. To clear them out of a house burn pyrethrum powder. It stupefies them so they may be swept up and burned. The odors of lavender, heliotrope, geranium and honeysuckle are claimed to be offensive to flies. It is said they will leave a room decorated in blue colors.

All of this is old advice but flies keep coming and so must the efforts to hold them in check continue. People may tell you of newer and better ways to oppose them. If so, use the newer way but until it is proved do not forget the old.—M. A.

Built Right-- Stays Right

When you buy a pipeless furnace, be sure it is not merely a set of miscellaneous castings. A furnace is not a furnace until it has been assembled and the castings ground and fitted to make sure all joints are smoke and gas tight. The place to do this is in the foundry, not in your cellar.

Every Moncrief Pipeless Furnace is carefully assembled, fitted and inspected in our foundry. The sections are then marked, knocked down and kept together as a unit. You can be sure that a Moncrief goes up right, stays right, and heats right.

MONCRIEF PIPELESS FURNACE

Every part of the Moncrief Pipeless Furnace is carefully made of selected materials. The grey iron that goes into our castings is of the highest grade because we combine the raw materials in our own cupolas. Our experience of a quarter of a century in furnace making assures Moncrief quality.

Hard or soft coal, wood or coke—any kind of fuel, burns freely in the Moncrief firepot, and its straight sides prevent ashes banking. No danger of the firepot's cracking—it is made in two pieces to permit a wide

range of contraction and expansion.

The contour of the firepot, feed section and radiator is such that the circulating air is brought into steady contact with the heated surface, yet is unhindered in its upward flow.

In the course of its long life the Moncrief Pipeless Furnace will pay for itself several times over in the fuel, time and work it saves. Get acquainted with its many good points. Ask the Moncrief dealer. Write us for his name if you do not know him.

Lowe Brothers

A new way—a quick way to paint your floors

No need to lug out all the furniture. Just move it over to one side; then paint the other side.

48 hours, and it is all done, and the room in use again. That means 2 days and 2 nights. But you can't do it with "any old floor paint." As sure as preaching, if you try it with anything but Lowe Brothers Hard-Drying Floor Paint, you will have a mess on your hands.

Lowe Brothers Floor Paint is made in a certain way to make it dry quickly, and hard, and still stand wear and tear. It gives a beautiful glossy surface, that can be wiped up same as if it were glass.

It is sold by the one best dealer in each town.

We'll be only too glad to send you a little booklet, called Floor Paint Lessons.

A Beechwood needs no coaxing!

You're no longer slave to the whims of a range when you own a Beechwood. The extra large fire box holds a banked fire longer without attention. The Duplex Grate in one turn takes the fire and puts it in shape for immediate cooking without coaxing or delay.

You're through with blacking. A cloth will make the polished top and enameled sides bright and spotless. Three colors, blue, brown, and gray.

Write for illustrated booklet giving details.

BEAUTIFYING THE HOME WITH FLOWERS

IF THE approach to my home is bare, overcrowded or untidy, friends who may drop in to call or visit receive a bad first impression.

A well-kept, bluegrass lawn is the best foundation for a front approach to a home. Having that and a few graceful shade trees so placed as to furnish protection and not to shut off the best views and spoil the beautiful stretches of green lawn, then we are ready to consider flowers or dwarf shrubs, the walks and driveway, to complete the home setting.

Frequently, bare and unsightly house foundations can be screened and improved wonderfully by setting clumps of dwarf shrubbery or groups of such flowers as the Cannas, or Salvia, quite near to the house and porch foundations.

Flowers for cutting are much more satisfactory when grown elsewhere than in the front yard, thus avoiding the ragged, unsightly effect that results when flowers must be closely cut for bouquets and decorations.

The writer has successfully grown Lobelia, Primrose, Heliotrope, Sultan, Geranium, Smilax Petunia, and other varieties of house plants from seed. Any kind of flower seed should be sown in a shallow box. Use loose, rich soil, containing one-third sand, make the surface perfectly smooth and level, sow seed and press gently down with a smooth board, so as to merely sink the seed into the soil; over the seed sift fine soil about 1-16th part of an inch in depth; again press gently down with a smooth board and the sowing is complete. Place the box in a pan of tepid water for a little while so as to let the water soak up from the bottom first time. Then put it in a light, sunny place, and keep a pane of glass over it to help retain the moisture and keep the temperature even. Leave a little space at one side of the box, not covered with glass, for ventilation. Keep moderately moist, but not wet, and the plants will appear in about ten days. As soon as they have four good leaves, transplant to small pots or shallow boxes.

The writer has used the same method for growing the following named outdoor plants. Larkspur, Canterbury Bells, Delphinium, Digitalis, Zinnia, Dusty Miller (a fine edging plant), Phlox, Candytuft, Alyssum, Balsams, Pinks and Pansies. It was found Pansies, Larkspur, and Delphiniums did better where the temperature remained from 65 to 75 degrees; the earlier in the season they are sown, the stronger the plants will be. Nearly all of them will do better when set out on the east side of a building, hedge, or row of tall growing plants where they are protected from the hot sun a portion of the day.—E. M. L. Blancher, New York.

DON'T NAG YOUR CHILD

I once had a sweet little girl of ten years say to me: "Mother nags me all the time." My heart went out to the child, for being a rather frequent caller at this home, I knew what the child said was true. Nothing the child did ever seemed to be just what the mother liked. One morning after arising, washing her face and combing her hair, she ran across the street to where her playmate lived. When she returned in a few minutes, her mother saw that she failed to tie her hair back with

PENNSYLVANIA FARMER
261 South Third Street, Philadelphia, Pa.

a ribbon. For this childish negligence she was scolded, and that began a series of naggings that continued thru the day. At the breakfast table chiding the child became nervous and upset a glass of milk. The mother harped on this the rest of the meal, and thus made an unhappy meal of it and an unfortunate start for the child and the rest of the family for the whole day.

A mother who nags is making her problem of family government very much harder for herself. It may be that it is due to discomfort of ill health, but more often it is because she has never learned the first principles of child management. There is much more than providing food and raiment in being a good father and mother.—Mrs. R. S. B.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give full measure when ordering. Patterns, waist measure for skirt, and are for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3550.—Good School Dress.—The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. A 10-year size will require 4½ yards of 27-inch material. Gingham in a check or plaid pattern, percale, seersucker, poplin and galatea are good for this model. Pattern, 10 cents.

3555.—Party Dress.—The pattern is cut in 4 sizes: 8, 10, 12 and 14 years. A 12-year size will require 4½ yards of 36-inch material. Batiste, voile, embroideries, net, silk, lawn, poplin, linen, crepe and crepe de chine could be used for this design. Pattern, 10 cents.

3533.—A Comfortable and Attractive Frock.—It is cut in 4 sizes: 6, 8, 10 and 12 years. A 10-year size will require 3½ yards of 27-inch material. Serge, gabardine, tricotine, velvet, gingham, and other wash fabrics are good for this style. Blue serge with a decoration of running stitches in black or red yarn will be smart. Pattern, 10 cents.

3504.—Charming Frock for Young Miss.—The pattern is cut in 3 sizes: 12, 14 and 16 years. A 14-year size will require 4½ yards of 36-inch material. Voile, batiste, organdy, chalice, poplin, taffeta or silk jersey, are good for this style. Pattern, 10 cents.

WEAVER PIANOS

"When you and I were young"

THE old songs have new thrills and new meanings when played on the Weaver. It lends to them its rare sweetness, purity, and power of tone—a tone that is beyond compare.

Nor are these qualities in the Weaver mere chance. They are inherent in every Weaver. They are the result of thought and painstaking care on the part of the Weaver craftsmen.

Fifty years of effort have given them a skill in pianoforte making of which they are jealously proud. And this pride goes into every Weaver. The result is a mechanical and artistic triumph.

There is a great satisfaction in owning an instrument which has the commendation and approval of some of the world's leading musicians. This the Weaver Piano has. It will have your commendation and approval, too, once you become the owner.

Divide the price of a De Laval by its years of service for its real cost.

THAT the best is the cheapest in the long run is doubly true of the De Laval Cream Separator.

Divide the price of a De Laval by the years of use you will receive—there are thousands in use from ten to twenty years, and even twenty to thirty years is not unusual—and you get a yearly cost that is much lower than that of any other separator you can buy.

During all these years of use the De Laval will skim with the utmost efficiency; it will save instead of waste cream; it will pay for itself over and over, and return you the greatest cash income.

That's why there are more than 2,500,000 in use the world over.

Furnished with hand, power or electric drives; sold only through agents; and if desired, on such terms that it will pay for itself.

Better Sires for Farm Herds

By W. H. TOMHAVE

THE Ontario Department of Agriculture has recently issued a bulletin that is to be used in the purebred sire campaign in Canada. It is full of useful information concerning the value of a good bull at the head of a herd of cattle, a good ram with a flock of sheep and the value of a good purebred boar in growing hogs. It gives a splendid description of a scrub bull, which is as follows:

"A scrub bull may be defined as a bull whose ancestors are unknown. He is an individual that has no place in particular to fill. His mission is to eat as much as possible without giving any returns, either in production of beef or milk. He is a source of annoyance to the neighbors, a bill of expense to the owner and the cause of a great yearly deficit in our livestock returns. Furthermore, he is a sure getter of inferior calves, thus keeping our average livestock shipments in the lower grades and giving our foreign competitors a

boar should be valued at not less than \$100. The same comparative value should be placed upon the ram that is used on the flock of breeding ewes.

There never was a more opportune time to secure a purebred sire to head the herd or flock than at present. The breeders of purebred livestock have a surplus of males of breeding age on hand that can be purchased at prices far below those prevailing during the past few years. This condition is due to the fact that a greater number of purebred animals are being produced and the temporary demand has slackened in keeping with all other commodities. At public sales, values have declined to about one-half of those prevailing during the past few years and have reached a level where farmers with a grade herd or flock can well afford to make a purchase to improve the animals produced on the farm. The initial cost of a purebred sire seems high to many farmers, and they con-

Spring Farm Pontiac 66664

great chance to capture and retain the foreign trade in the world's market.

"His offspring inherit all the poor qualities of their sire, and as they increase these poor qualities become more pronounced as time goes on; therefore we have a retrograde movement which gains in its magnitude year after year."

There are too many sires upon the farms of this country that come in this class and as long as such sires are kept, very little progress can be made in livestock improvement. The selection of the sire for breeding the females on the farm should receive more than passing consideration. It is thru the use of good sires that real progress can be made at a small initial expense to the farmer. There is an old saying which goes as follows:

"A bull is in money worth five times a cow; a boar for the breeding herd, three times a sow."

This general rule is as true today as it ever was and can often be used as a guide in buying a purebred sire. When a herd of grade cows are kept that are valued at from \$75 to \$100 the herd bull should be worth \$350 to \$500. When brood sows are valued at \$35 to \$40 per head, the herd

milk and 385 pounds of butterfat or 174 per cent more milk and 130 per cent more fat than their scrub grand dams or the original cow. Some of the cows of the first generation or the first cross by a purebred sire, showed an increase of 75 per cent in the amount of milk produced over the amount produced by their dams. This experiment and the observation of practical breeders shows that the production of a scrub or grade herd can be doubled in two generations by the use of a purebred sire from a dam of known production. When such is the case, is there any reasonable excuse for continuing with a grade dairy sire? Is not the grade sire expensive at any price? There is no greater expense in the feeding and care of a high grade or purebred herd than there is in the handling of a scrub herd. There are many similar illustrations with all other classes of livestock. The grade or scrub sire is a mill stone around the neck of progress in animal breeding and livestock improvement.

In a purebred sire campaign the following are some of the cardinal points to be kept in mind.

1—In a purebred sire campaign the pedigree scrub must not be overlooked. An inferior purebred sire is a detriment to any herd or flock. Breeders of purebred animals should use the knife on all inferior males and sell only such animals as they would care to use in building up a herd or flock.

2—Let all scrub sires be put on trial and condemned to the "shambles" as they are more valuable there than in the breeding herd.

3—The purebred sire is half the herd; the scrub is all the herd. Improved livestock can only be secured thru the use of better sires. The young animals on the farm reflect the character of the sire used on the place.

4—A good purebred sire is cheaper at any price than a scrub sire as a gift.

5—The boys and girls will take pride and greater interest in good livestock. Is there any livestock too good for the farm boy or girl? Association with good livestock will develop real men.

6—If you breed purebred livestock or keep purebred sires, let the public know what you are doing.

A cow tester has written a poem entitled "In Memoriam" in memory of the scrub cow which may be of interest to some of our readers, as it states the truth:

"Good-bye, Old Brindle, bony scrub,
The times demand a better breed.
You eat enough, but there's the rub.
You never pay for half your feed;
So after all these years we part,
But pray remember as you go
If this should break your bovine
heart,
You broke my purse long, long ago."

MILK FOR CALVES

Calves can be raised without milk. But when you see calves raised on milk and note their vigor and the remarkable development of their bodies, it is hard to overestimate milk as a food for calves. Sometimes it may pay to sell the milk and buy other feeds for the calf but if you wish to be sure and raise a healthy calf and want it to be vigorous and a good cow for the dairy, I believe no mistake is made in feeding that calf a lot of milk. It is nature's food for making a plump lively calf.—R. G. K.

Cheap by the ton, but worth its weight in gold—good old honest sunlight is invaluable in both poultry house and dairy barns.

Don't let inferior oil hold up your trucks

Profits today depend upon rigid economy

WHETHER you use a little one-tonner on pneumatics or a fleet of 5-ton giants, every truck must pay its way today. Layups for repairs wipe out months of profits.

Scientific checking shows that 90% of all truck engine troubles are due to faulty lubrication. Ordinary oil forms black sediment when subjected to the intense heat of the engine—200° to 1000° F. Cylinders are scored, bearings loosen, over-heating becomes common.

Keep expense like this off your books. Sediment is reduced 86% when you use Veedol, the lubri-

cant that resists heat. (See the two bottles at the left). With Veedol in the crankcase most serious troubles are prevented. Engines pull better, throttle down lower.

Have your men flush out their engines. Instruct them to fill up with Veedol. Leading dealers have Veedol in stock. Consult them for quotations.

Veedol lubricants for every part of the chassis

Use Veedol lubricants for all parts of the car: VEEDOL for the engine (light, medium, heavy, special heavy, extra heavy); for the differential and transmission VEEDOL TRANS-GEAR OIL or GEAR COMPOUND; for the tractor and truck WORM DRIVE OIL; GRAPHITE GREASE; CUP GREASE.

BUTTERMILK for Hogs and Poultry

Experienced feeders know that there is no better feed for growing hogs and poultry than buttermilk. A regular supply, however, has been difficult or impossible to obtain and feeders have had to do without it. A process has now been worked out for putting this valuable feed on the market in a condensed form, called SEMI-SOLID BUTTERMILK. By simply adding water you get real, genuine buttermilk with all its great feed value.

Semi-Solid Buttermilk, like fresh buttermilk, is an appetizer and tonic, as well as a feed, and keeps hogs in prime condition.

The hogs consume it eagerly and thrive on it. It is a wonderful tonic and conditioner as well as a most valuable feed. Readers of this paper interested in getting rapid growth and good, healthy stock should feed SEMI-SOLID BUTTERMILK. For further information about Semi-Solid Buttermilk and feeding hogs and poultry for greater profit, write to H. Nester & Co., Dept. 3612, No. 3 Chestnut St., Philadelphia, Pa., or Consolidated Products Co., Dept. 3612, Lincoln, Neb.

Cheap by the ton, but worth its weight in gold—good old honest sunlight is invaluable in both poultry house and dairy barns.

THE PHILADELPHIA RECORD'S \$1000 Puzzle Picture

Open to All Everybody Join In

"The Philadelphia Record" announces today a most interesting and amusing game. All can participate in this great fun game—from a school boy or girl to Dad, Mother, and even Grandpa and Grandma. It holds no preference to age. It is a test of your skill in ferreting out "S-words" in the Puzzle Picture. It's a jim-dandy puzzle game. We know you will enjoy it, for everyone loves a puzzle, and we venture to say you'll never have more fun.

Easy to Solve

Here's a Picture Puzzle which contains a number of objects and articles beginning with the letter "S." Fifteen Cash Prizes will be given for the best answers to this Puzzle. The answer having the nearest correct list of names will be awarded first prize; second nearest correct list, second prize, etc. See how many you can find.

Additional copies of Puzzle Picture free on request.

THE PHILADELPHIA RECORD \$1000. Puzzle Picture

How Many Objects Beginning With "S" Can You Find in This Picture? Costs Nothing to Try

It costs nothing to take part. The "S-Word" Puzzle Game is a campaign to increase the popularity of "The Record." It is not a subscription contest, and you do not have to send in a single subscription to win a prize. If your answer is awarded first prize by the judges, you will win \$30; but if you would like to win more than \$30, we are going to make the following special offer, whereby you can win bigger cash prizes.

YOU CAN WIN \$1000

Here's how: If the judges award your answer first prize, and you have sent in one yearly subscription to the Daily or Sunday "Record," you will receive \$350 instead of \$30; Second Prize, \$250; Third Prize, \$150.00. (See second column of figures in prize list.)

Or, if you are awarded First Prize and you have sent in two yearly subscriptions (either one new and one renewal, or two new subscriptions) to the Daily or Sunday "Record," you will receive \$1000 instead of \$30; Second Prize, \$750; Third Prize, \$500. (See third column of figures in prize list.)

It takes but two subscriptions to qualify for the big \$1000 reward. Absolutely two subscriptions is the maximum, one of which is to be a new subscriber. You can do this with little effort. Your own subscription will count as one and we can take subscriptions to start at any future date. In sending in your subscription give full instructions on a separate sheet from that on which you send your answer.

Address

THE RECORD

Philadelphia Pennsylvania

Subscription Rates Payable in Advance

By Carrier or Agent	By Mail Outside of Philadelphia & Camden
Daily Only \$6.24	Daily Only \$6.00
Sunday Only \$2.00	Sunday Only \$1.80
Daily & Sunday.....\$11.44	Daily & Sunday.....\$12.00

OBSERVE THESE RULES

1. Any man, woman or child who is not in the employ of the Philadelphia Record, or a member of an employer's family, may submit an answer. It costs nothing to try.
2. All answers must be mailed by your Post Office closing time, May 21st, 1921, and addressed to Ray F. Newell, Puzzle Manager, The Philadelphia Record.
3. All lists of names should be written on one side of the paper only, and numbered numerically. Write your full name and address on each face in the upper right hand corner. If you desire to write anything else, use a separate sheet.
4. Only such words as appear in the English Dictionary will be counted. Do not use obsolete words. Where the plural is used, the singular cannot be counted and vice versa.
5. Words of the same spelling can be used only once, even though used to designate different objects or articles, or parts of objects or articles. An object or article can be named only once.
6. Do not use hyphenated or compound words, or any words formed by the combination of two or more complete English words, where each word in itself is an object.
7. The answer having the nearest correct list of names of visible objects and articles shown in the picture that begin with the letter "S" will be awarded First Prize, etc. Neatness, style or handwriting have no bearing upon deciding the winners.

THE PRIZES

Winning answers will receive cash prizes according to table below:

	If no subscription is sent	If one subscription is sent	If two subscriptions are sent
1st Prize.....	\$30.00	\$350.00	\$1000.00
2nd Prize.....	20.00	250.00	750.00
3rd Prize.....	15.00	150.00	500.00
4th Prize.....	10.00	100.00	300.00
5th Prize.....	7.50	50.00	150.00
6th Prize.....	5.00	40.00	100.00
7th Prize.....	3.00	30.00	80.00
8th Prize.....	3.00	20.00	60.00
9th Prize.....	3.00	15.00	40.00
10th to 15th....	2.00	10.00	20.00

*Note: In order to qualify your answer for the maximum awards, it will only be necessary to send in one renewal and one new subscription, or two new subscriptions, but two renewal subscriptions cannot be counted.

Care of Brooder Chicks

By R. G. KIRBY

POULTRYMEN in our section generally admit that there is nothing like the old hen to properly bring a little brood of ten or twelve chicks. But economy must be considered in producing poultry. The cost per chick is not so important with a few broods but means a lot if from four hundred to several thousand are produced.

We find that the use of coal burning brooder stoves will cut down the cost per chick by reducing the amount of labor and equipment needed in bringing them up. A flock of 200 chicks may require around fifteen to twenty hen mothers. The same number of brood coops are needed. Each coop must have a dish of water and sour milk. Each coop requires more or less separate feeding and each must be closed at night. There is nothing more tiresome than having to close up a large number of brood coops after a hard day when all of the energy has been spent. It is so much easier to close and lock the doors of a few colony houses without bending over.

The hen brooded chicks are in more danger from lice and are more difficult to feed in bad weather than the chicks in a brooder house. Place 200 chicks under a coal burning brooder and here are the main items of work. Keep one water fountain and one sour milk fountain clean and filled. There will be no old hens to water and feed. Keep a hopper of dry mash in the brooder house and all the chicks have access to it.

It is easier to keep the brooder house clean than to clean many brood coops housing hens and chicks together. The ashes must be shaken down and coal added both morning and night. On several occasions we have started a fire in a colony brooder stove the day before the chicks were put under the hover and never had it go out until chicks were feathered out and the heat was no longer needed. When the fires have gone out it has happened in the day time on days so warm that they had been partially neglected. When a serious effort is made at night to keep up a good fire, we always find the stove burning in the morning. This is done by turning on the draughts enough in the evening to insure a brisk fire before the stove is adjusted and shut down for the night.

Chicks in a colony brooder house can obtain a certain amount of ranging and scratching even when the weather is bad and they cannot be free. Green sods can be supplied and sprouted oats and plenty of clover chaff or other scratching material in which they can work. The chicks under the hen are without exercise if the hen must hover them constantly during a storm period of several days. Those chicks are chilled if the hen does not hover them constantly. They are more difficult to feed than the chicks in the brooder house and this makes more work and worry for the poultryman when a lot of hen mothers are used for early hatching. Of course late in the season the weather may be very hot and then conditions are different. We find coal burning in brooders more difficult to manage in

hot weather and the hen brooded chicks cause less worry than they would in the early spring when weather conditions are bad. Before placing chicks under a hover start the fire and allow it to dry out the house. Furnish plenty of litter. A bright yellow straw litter hides the feet of the chicks and helps to prevent toe picking. Just the fact that they can satisfy their instinct to scratch helps to take their attention from their feet. If a few individuals show that cannibal tendency they can be isolated until they forget the habit. That will prevent it from spreading among a large flock. Pieces of meat hung on strings will help to prevent toe picking. It seldom causes much trouble among thrifty chicks on a balanced ration.

If there is about an inch of sand on the brooder house floor beneath the litter, that will supply plenty of grit. But it pays to keep some fine chick grit or coarse sand in a hopper to insure every chick obtaining it. Grit is the first feed for chicks. Next give them a chance at drinking sour milk or buttermilk. That seems to reduce the chances of bowel trouble. Do not use garden loam in the brooder house as the stove will dry it out and change it to dust. The young chicks will kick the air full of dust and make the atmosphere unhealthy. If sand cannot be obtained we would prefer to use only the straw or clover chaff litter on the colony house floor.

A hopper containing bran and one house clean than to clean many brood coops housing hens and chicks together. The chicks remain healthy. Sometimes chicks that are otherwise vigorous appearing, will paste up. Keep a medicine dropper and a bottle of castor oil handy. Give a few drops of castor oil to a chick that is beginning to paste up. It will often cause the condition to clear up. Use the castor oil before the chick becomes weak and devitalized and loses its appetite.

We have found that the commercial growing mashers are fine to develop meat, bone and feathers on young chicks. They may seem rather expensive but they do not have to be used very long and a 100 pounds of growing mash does seem to produce a lot of thrifty chick growth. For the first four or five days we give the chicks nothing as a scratch food but dry rolled oats. They like the oats and this feed is great for producing growth in all kinds of young animal and bird life.

After that we use commercial chick scratch feed and continue it until the chicks can eat cracked wheat and corn. But we have found by experience that chicks can be produced at less cost if they have a mash before them at all times. Then we do not need to feed so much hard grain and the chicks do seem to develop faster.

Sour milk is a great asset in making rapid growth. In some sections where the demand for milk is slack it may be possible to buy several cans may be very hot and then conditions are different. We find coal burning in brooders more difficult to manage in

Comfort of the big car—
with "Hasslers"
on your Ford!

YOU won't envy the owner of the big car when you get your Ford equipped with Hassler Shock Absorbers! You will be able to travel the same roads, at the same speed, for the same distance—with the same luxurious comfort—with the same enjoyment of every mile! And you will be saving one-third of your usual up-keep, tire and depreciation costs! These savings will quickly pay for your Hasslers.

Any Hassler dealer will put them on your car, let you use them for 10 days, then refund every cent of your money if you are not entirely satisfied! Write us if you don't know your Hassler dealer.

This illustrates the Hassler model now made for the Dodge Brothers Car—giving it perfect luxury and added smartness. Four Hasslers to the set—and they do not change any part of the car. Ask your Dodge Dealer.

HASSLER PENNSYLVANIA CO.

Shock Absorbers

Sanitation in the brooder house is important. The poultryman who keeps the litter clean and occasionally sprays the house with disinfectants finds his reward in a low mortality rate and a flock of chicks that grow sturdy and strong with an abundance of glossy plumage.

The length of time a brooder stove is needed depends on the season. But when the chicks are feathered out and seem to wish to roost at night, it pays to remove the stove and place low roosts in the house. Chicks that roost do not overcrowd every night and become overheated. They are easier to protect from mites and lice.

The small wooden brooders heated by oil lamps are often satisfactory to breeders with small flocks. Such brooders require a lot of attention. They must be very clean and never overcrowded. Their capacity for real service is sometimes overestimated. The chicks soon become large and sickness results from the quarters being too close. In very cold weather such brooders should be placed in a colony house even if they are supposed to be outside brooders. When placed outside during storms it may be necessary to cut down the ventilation too much in order to keep up the heat.

Even coal burning brooders can be overcrowded. Many of them will protect up to one thousand chicks. We have used such brooders with only 200 to 300 chicks per stove and find they are easier to manage. The conditions on the brooder floor will be better, the chicks will not overcrowd too much and the mortality rate will be less with the moderately sized flock.

With a stove brooder a thermometer is not needed, except possibly at first to make a study of temperatures. Keep a fairly warm fire burning and the chicks will select the point where the air is comfortably warm. We like to see them sleeping in a ring near the edge of the hover. Then they can move in toward the stove if it cools slightly before morning. Both chilling and overheating are bad for chicks. In a tight box brooder they cannot avoid the conditions. With a colony stove brooder it is only necessary for the chick to move. And nature tells chicks how much heat they need in order to live. It is a great factor in helping the poultryman to succeed with artificial brooding.

TRAPPING RATS

We have had the best luck catching rats in the steel spring traps. The traps must be placed near the rat holes or runways and covered carefully with a light layer of clover chaff or other deceptive material. Nearly all the rats we have caught have been held by only one leg showing that they travel fast and would not be apt to be caught in any device that they could see.

We have never caught a rat in a steel trap left exposed regardless of how tempting the bait might be. We have tried scattering cheese and meat over the concealed trap but have had the best luck by using a handful of wheat or corn.

The use of poison for rats is dangerous on a farm because it may be found by children, poultry or farm pets. The best insurance against rats is to use cement floors in buildings and clean up all the old scrap lumber piles and stone heaps where the pests can breed.—R. G. Kirby.

Self mastery is the essence of Heroism.

Suited to Many Orchard Jobs

ASIDE from the important job of orchard cultivation, Case 10-18 and 15-27 H. P. Kerosene Tractors demonstrate their great value to fruit growers in other ways. On the job of spraying, for instance, if you have a big orchard to cover and you are rushed for time, one of these tractors will pull a big-capacity power sprayer steadily, without stop, regardless of how hot the weather may be.

In some localities orchardists also find their Case Tractors a great help in clearing land and preparing the ground for young trees. For the jobs of uprooting stumps and big boulders, pulling up old hedges, etc., the sturdy construction and ample reserve power of Case Tractors make them especially valuable.

The four-cylinder, valve-in-head, kerosene-burning Case motor is mounted crosswise on a twist-proof frame, which permits the use of all cut-steel gears, enclosed and running in lubricant, for delivering the engine's power to the drive wheels.

Because of this design and construction from 65 to 70% of the motor's power is available at the drawbar. The belt pulley being mounted directly on the crankshaft insures full power delivery on belt jobs such as operating large-capacity cider press, feed grinder, etc. The compact design of Case Kerosene Tractors and their flexibility of control enables operator to work close to trees when cultivating.

While you are considering the matter of applying tractor power to your orchard operations, write for our catalog descriptive of Case Kerosene Tractors, Grand Detour Orchard Plows and Disc Harrows.

NOTE: We want the public to know that our plows and harrows are NOT the Case plows and harrows made by the J. I. Case Plow Works Co.

R. K. TIRES

The Utmost in Tire Value

The ability of these tires to stand up under the most rigorous conditions and yield a mileage per dollar far in excess of that expected of a new tire makes them the most economical buy on the tire market. R. K. Double Treat Tires are skilfully retreaded, cemented, and double chain stitched, making them as good as new, although the price is but half. And we guarantee satisfaction.

The Valley of the Giants

By PETER B. KYNE

Chapter I

IN THE summer of 1850 a topsail schooner slipped into the cover under Trinidad Head and dropped anchor at the edge of the kelp-fields. Fifteen minutes later her small-boat deposited on the beach a man armed with long squirrel-rifle and an axe, and carrying food and clothing in a brown canvas pack. From the beach he watched the boat return and saw the schooner weigh anchor and stand out to sea before the northwest trades. When she had disappeared from his ken, he swung his pack to his broad and powerful back and strode resolutely into the timber at the mouth of a little river.

The man was John Cardigan; in that lonely, hostile land he was the first pioneer. This is the tale of Cardigan and Cardigan's son, for in his chosen land the pioneer leader in the gigantic task of hewing a path for civilization was to know the bliss of woman's love and of parenthood, and the sorrow that comes of the loss of a perfect mate; he was to know the tremendous joy of accomplishment and worldly success after infinite labor; and in the sunset of life he was to know the dull despair of failure and ruin. Because of these things there is a tale to be told, the tale of Cardigan's son, who, when his sire fell in the fray, took up the fight to save his heritage—a tale of life with its love and hate, its battle, victory, defeat, labor, joy and sorrow, a tale of that unconquerable spirit of youth which spurred Bryce Cardigan to lead a forlorn hope for the sake not of wealth but of an ideal. Hark, then, to this tale of Cardigan's redwoods:

Along the coast of California, thru the secret valleys and over the tumbled foothills of the Coast Range, extends a belt of timber of an average width of thirty miles. In approaching it from the Oregon line the first tree looms suddenly against the horizon—an outpost, as it were, of the host of giants whose column stretches south nearly four hundred miles to where the last of the rear-guard maintains eternal sentry-go on the crest of the mountains overlooking Monterey Bay. Far in the interior of the State, beyond the fertile San Joaquin Valley, the allies of this vast army hold a small sector on the west slope of the Sierras.

These are the redwood forests of California, the only trees of their kind in the world and indigenous only to these two areas within the State. The coast timber is known botanically as sequoia sempervirens, that in the interior as sequoia gigantea. As the name indicates, the latter is the larger species of the two, altho the fibre of the timber is coarser and the wood softer and consequently less valuable commercially than the sequoia sempervirens—which in Santa Cruz, San Mateo, Marin, and Sonoma counties has been almost wholly logged off, because of its accessibility. In northern Mendocino, Humboldt, and Del Norte counties, however, sixty years of logging seems scarcely to have left a scar upon this vast body of timber. Notwithstanding sixty years of attrition, there remain in this section of the redwood belt thousands upon thousands of trees of virgin

timber that had already attained a vigorous growth when Christ was crucified. In their vast, somber recesses, with the sunlight filtering thru their branches two hundred and fifty feet above, one hears no sound save the tremendous diapason of the silence of the ages; here, more forcibly than elsewhere in the universe, is one reminded of the littleness of man and the glory of his Creator.

In sizes ranging from five to twenty feet in diameter, the brown trunks rise perpendicularly to a height of from ninety to a hundred and fifty feet before putting forth a single limb, which frequently is more massive than the growth which men call a tree in the forests of Michigan. Scattered between the giants, like subjects around their king, one finds noble fir, spruce, or pine, with some Valparaiso live oak, black oak, pepper-wood, madrone, yew, and cedar.

In May and June, when the twisted and cowering madrone trees are putting forth their clusters of creamy buds, when the white blossoms of the dogwoods line the banks of little streams, when the azaleas and rhododendrons, lovely and delicate as orchids, blaze a bed of glory, and the modest little oxalis has thrust itself up thru the brown carpet of pine-needles and redwood-twigs, these wonderful forests cast upon one a potent spell. To have seen them once thus in gala dress is to yearn thereafter to see them again and still again and grieve always in the knowledge of their inevitable death at the hands of the woodsman.

John Cardigan settled in Humboldt County, where the sequoia sempervirens attains the pinnacle of its glory, and with the lust for conquest hot in his blood, he filed upon a quarter-section of the timber almost on the shore of Humboldt Bay—land upon which a city subsequently was to be built. With his double-bitted axe and crosscut saw John Cardigan brought the first of the redwood giants crashing to the earth above which it had towered for twenty centuries, and in the form of split posts, railroad ties, pickets, and shakes, the fallen giant was hauled to tidewater in ox-drawn wagons and shipped to San Francisco in the little two-masted coasting schooners of the period. Here, by the abominable magic of barter and trade, the dismembered tree was transmuted into dollars and cents and returned to Humboldt County to assist John Cardigan in his task of hewing an empire out of a wilderness.

At a period in the history of California when the treasures of the centuries were to be had for the asking or the taking, John Cardigan chose that which others elected to cast away. For him the fertile wheat and fruit-lands of California's smiling valleys, the dull placer gold in her foot-hill streams, and the free grass, knee deep, on her cattle and sheep-ranges held no lure; for he had been first among the Humboldt redwoods and had come under the spell of the vastness and antiquity, the majesty and promise of these epics of a planet. He was a big man with a great heart and the soul of a dreamer, and in such a land as this it was fitting he should take his stand.

In that wasteful day a timber-claim was not looked upon as valua-

ble. The price of a quarter-sector was a pittance in cash and a brief residence in a cabin constructed on the claim as evidence of good faith to a government none too exacting in the restrictions with which it hedged about its careless dissipation of the heritage of posterity. Hence, because redwood timber-claims were easy to acquire, many men acquired them; but when the lure of greener pastures gripped these men and the necessity for ready money oppressed, they were wont to sell their holdings for a few hundred dollars. Gradually it became the fashion in Humboldt to "unload" redwood timber-claims on thrifty, far-seeing, visionary John Cardigan who appeared to be always in the market for any claim worth while.

Cardigan was a shrewd judge of stumpage; with the calm certitude of a prophet he looked over township after township and cunningly checkerboarded it with his holdings. Notwithstanding the fact that hill-side timber is the best, John Cardigan in those days preferred to buy valley timber, for he was looking forward to the day when the timber on the watersheds should become available. He knew that when such timber should be cut it would have to be hauled out thru the valleys where his untouched holdings formed an impenetrable barrier to the exit! Before long the owners of timber on the watersheds would come to realize this and sell to John Cardigan at a reasonable price.

Time passed. John Cardigan no longer swung an axe or dragged a cross-cut thru a fallen redwood. He was an employer of labor now, well known in San Francisco as a manufacturer of split-redwood products, the purchasers sending their own schooners for the cargo. And presently John Cardigan mortgaged all of his timber holdings with a San Francisco bank, made a heap of his winnings, and like a true adventurer staked his all on a new venture—the first sawmill in Humboldt County.

The timbers for it were hewed out by hand; the boards and planking were whipsawed. It was a tiny mill, judged by present-day standards, for in a fourteen-hour working day John Cardigan and his men could not cut more than twenty thousand feet of lumber. Nevertheless, when Cardigan looked at his mill, his great heart would swell with pride. Built on tidewater and at the mouth of a large slough in the waters of which he stored the logs his woods-crew cut and peeled for the bull-whackers to haul with ox-teams down a mile-long skid-road, vessels could come to Cardigan's mill dock to load and lie safely in twenty feet of water at low tide. Also this dock was sufficiently far up the bay to be sheltered from the heavy seas that rolled in from Humboldt Bar, while the level land that stretched inland to the timber-line constituted the only logical townsite on the bay.

"Here," said John Cardigan to himself exultingly when a long-drawn wail told him his circular saw was biting into the first redwood log to be milled since the world began, "I shall build a city and call it Sequoia. By tomorrow I shall have cut sufficient timber to make a start. First I shall build for my employees better homes than the rude shacks and tent-houses they now occupy; then I shall build myself a fine residence with six rooms, and the room that faces on the bay shall be the parlor. When I can afford it, I shall build a larger mill, employ more men, and build more houses. I shall

encourage tradesmen to set up in business in Sequoia, and to my city I shall peremptory church and a school-house. We shall have a volunteer fire department, and if God is good, I shall, at a later date, get out some long-length fir-timber and build a schooner to freight my lumber to market. And she shall have three masts instead of two, and carry half a million feet of lumber instead of two hundred thousand. First, however, I must build a steam tugboat to tow my schooner in and out over Humboldt Bar. And after that—ah, well! That is sufficient for the present."

Chapter II

Thus did John Cardigan dream, and as he dreamed he worked. The city of Sequoia was born with the Argonaut's six-room mansion of rough redwood boards and a dozen three-room cabins with lean-to kitchens; and the tradespeople came when John Cardigan, with something of the largeness of his own redwood trees, gave them ground and lumber in order to encourage the building of their enterprises. Also the dream of the schoolhouse and the church came true, as did the steam tugboat and the schooner with three masts. The mill was enlarged until it could cut forty thousand feet on a twelve-hour shift, and a planer and machines for making rustic siding and tongued-and-grooved flooring and ceiling were installed. More ox-teams appeared upon the skid-road, which was longer now; the cry of "Timber-r-r-r!" and the thunderous roar of a falling redwood grew fainter and fainter as the forest receded from the bay shore, and at last the whine of the saws silenced these sounds forever in Sequoia.

At forty John Cardigan was younger than most men at thirty, albeit he worked fourteen hours a day, slept eight, and consumed the remaining two at his meals. But thru all those fruitful years of toil he had still found time to dream, and the spell of the redwoods had lost none of its potency. He was still checker-boarding the forested townships with his adverse holdings—the key-positions to the timber in back of beyond which some day should come to his hand. Also he had competition now; other sawmills dotted the bay shore; other three-masted schooners carried Humboldt redwood to the world beyond the bar, over which they were escorted by other and more powerful steam-tugs. This competition John Cardigan welcomed and enjoyed, however, for he had been first in Humboldt, and the townsites and a mile of tidelands fronting on deep water were his; hence each incoming adventurer merely helped his dream of a city to come true.

At forty-two Cardigan was the first mayor of Sequoia. At forty-four he was standing on his dock one day, watching his tug kick into her berth the first square-rigged ship that had ever come to Humboldt Bay to load a cargo of clear redwood for foreign delivery. She was a big Bath-built clipper, and her master a lusty down-Easter, a widower with one daughter who had come with him around the Horn. John Cardigan saw this girl come up on the quarter-deck and stand by with a heaving-line in her hand; calmly she fixed her glance upon him, and as the ship was shunted in closer to the dock, she made the east to Cardigan. He caught the light heaving-line, hauled in the heavy Manila stern-line to which it was at-

tached, and slipped the loop of the mooring-cable over the dolphin at the end of the dock.

"Some men wanted aft here to take up the slack of the stern-line on the windlass, sir," he shouted to the skipper, who was walking around on top of the house. "That girl can't haul her in alone."

"Can't! I'm short-handed," the skipper replied. "Jump aboard and help her."

Cardigan made a long leap from the dock to the ship's rail, balanced there lightly a moment, and sprang to the deck. He passed the bight of the stern-line in a triple loop around the drum of the windlass, and without awaiting his instructions, the girl grasped the slack of the line and prepared to walk away with it as the rope paid in on the windlass. Cardigan inserted a belaying-pin in the windlass, paused and looked at the girl. "Raise a chantey," he suggested. Instantly she lifted a sweet contralto in that rollicking old ballad of the sea—"Blow the Men Down."

For tinkers and tailors and lawyers and all. Way! Aye! Blow the men down! They ship for real sailors aboard the Black Ball. Give me some time to blow the men down.

Round the windlass Cardigan walked, steadily and easily, and the girl's eyes widened in wonder as he did the work of three powerful men. When the ship had been warped in and the slack of the line made fast on the bitts, she said:

"Please run for'd and help my father with the bowlines. You're worth three foremast hands. Indeed, I didn't expect to see a sailor on this dock."

"I had to come around the Horn to get here, Miss," he explained, "and when a man hasn't money to pay for his passage, he needs must work it."

"I'm the second mate," she explained. "We had a succession of gales from the Falklands to the Evangelistas, and there the mate got her in irons and she took three big ones over the taffrail and cost us eight men. Working short-handed, we couldn't get any canvas on her to speak of—long voyage, you know, and the rest of the crew got scurvy."

"You're a brave girl," he told her.

"And you're a first-class A. B.," she replied. "If you're looking for a berth, my father will be glad to ship you."

"Sorry, but I can't go," he called as he turned toward the companion ladder. "I'm Cardigan, and I own this sawmill and must stay here and look after it."

There was a light, exultant feeling in his middle-aged heart as he scampered along the deck. The girl had wonderful dark auburn hair and brown eyes, with a milk-white skin that sun and wind had sought in vain to blemish. And for all her girlhood she was a woman—bred from a race (his own people) to whom danger and despair merely furnished a tonic for their courage. What a mate for a man! And she had looked at him pridefully.

Our deeds shall travel with us from afar, And what we have been makes us what we are.—Geo. Elliot.

Sorrow follows wrong, as echo follows song.

A Story for Children

The Little Runaway

"NETTIE!" called Mother sharply as she heard Rover, the collie dog, yelp once again. "If you cease Rover any more I shall have to punish you. Why must you pick on your doggie just because I won't let you go on that long, hard hike."

"I don't care! I will if I want to," sauced Nettie.

Mother came to the door just in time to see Nettie pull Rover's tail, and then run around the corner.

"Nettie! Come right in here and sit on this stool until you can behave yourself!"

A sulky little curly-headed girl walked into the house and threw herself on the stool. She sat there in bitter silence thinking how badly she was treated.

After an hour had passed Mother came to Nettie and smilingly said: "Nettie, dear, aren't you sorry now? Kiss Mother and then you may get down."

Nettie climbed from her stool and walked away without a word. Mother let her go being too wise to say anything more. Soon she saw her little daughter stealing around the house with a bundle under her arm, and she let her go.

When Father came home, it was getting dark and still Nettie had not returned.

"I am a little worried. Don't you think you had better go for her, Father?"

"No, no," he answered. "Let her learn a lesson. I have an idea. Let's send Rover. I'll wager she'll be glad to see him."

Meanwhile Nettie was walking along a dusty road, tired and hungry. She was beginning to vision her Mother getting supper, and she began to wonder where she could find something to eat. It was the first time that that had occurred to her.

"Hoo! hoo! ho-o-o!" came from out of the dusk.

Nettie jumped to the side of the road and crouched underneath some elderberry bushes. She was too frightened to move again. Large tears began to trickle down her cheeks, and from every nook and corner new sounds seemed to come. She could see slight forms moving about among the trees. Something came up to her side and she froze stiff with terror. A cold nose was thrust into her face and a familiar form loomed up before her.

"Oh-oh, Rover," she breathed, "I'm so glad to see you. Dear old doggie. I love you so much."

An hour later a tired, dusty and much ashamed little girl walked into her home followed by her faithful dog.

Mother looked at Father and put her finger to her lips, and then said sweetly:

"Did you have a nice walk? I guess you're hungry aren't you. Well Mother has your supper all hot for you dear."

As she was eating, Nettie suddenly choked and then started to sob. Putting her arms around her mother's neck, she said: "I'm—I'm sorry. Mother."—L. M. K.

Keep Them in Handy Places

YOU'LL find it mighty convenient to keep several pairs of Boss Work Gloves where you use them most often.

Hang a pair up in the barn to slip on when you clean out the stalls. Have a pair in the shed to wear while splitting or sawing wood. Keep a pair in the machine shop for all repair work. Put a pair in the tool box of your car to wear while changing tires and tinkering round the engine.

Boss Work Gloves will protect your hands from dirt, grease, cuts, bruises and all minor injuries. They are tough durable gloves for all rough work. But they are so flexible that you get a free feel of the job in hand.

Ask for Boss Work Gloves by name. They come in sizes for men and women, boys and girls, and in three styles of wrist—ribbed, band and gauntlet.

THE BOSS MEEDY—best quality, medium weight cotton flannel.
THE BOSS HEVY—very best quality, heavy weight cotton flannel.
THE BOSS XTRA HEVY—finest grade of extra heavy cotton flannel.
THE BOSS WALLOWER—highest quality, heaviest weight cotton flannel.
THE BOSS LETHERPOW—heavy cotton flannel with tough leather on palms, fingers and thumbs.
THE BOSS JERZY—highest quality cotton jersey cloth in many colors.
THE BOSS TIKMIT—Roomy mittens made of ticking that wears like iron.
THE BOSS ELASTO—strong cotton flannel. Made by a patented process in one weight only.

THE BOSS MANUFACTURING CO.
Kewanee, Ill.

NEED OF MORE RURAL NEWS

The agricultural officials of the Cortland County, N. Y., Home Bureau and representatives of newspapers of Cortland County, held a conference at Cortland recently and discussed problems concerning rural news gathering and publication.

The two speakers for the day were Mrs. M. G. Feint of Cortland County, who is a reporter for the Pennsylvania Farmer, and other agricultural papers, and Prof. M. V. Atwood, of the State College of Agriculture, a county newspaper publisher as well as an editor and instructor in the extension service at Cornell University.

Among other interesting things Mrs. Feint said: "one-half the people of this country today are of the rural population and they feed the other half. The consumer should always feel a source of interest in those who supply his food. The biggest handicap today in the problem, is the lack of understanding on the part of the consumer. The man who eats the food should know about his fellow associate who tills the soil, and vice versa.

"The newspaper must consider that the readers of the average community papers are 70 per cent rural. That is a good proportion and their wants are worth considering. The interest of the people is broadened by good rural news, and today they want more than the personal column."

It is a very short sighted policy, Mrs. Feint said, that will allow any farmer to skimp himself on reading matter adapted to his work, especially the local papers of his county. These, with a good variety of farm papers, are as necessary to the carrying on of profitable farm work as are the farm tools and machinery he invests in, it is believed by most successful farmers.

Mrs. Feint pointed out that "many valuable things right here in this county never get into the papers because the reporters do not see the news value in them, even though they are frequently of state or national value. Sometimes the information is too incomplete. The reporters need to be taught what is news and what is real rural news."

—E. M. L. B.

FARM ORGANIZATIONS

(Continued From Page 7.)

ties demanded by modern social needs which are more nearly comparable to those of the towns. During the past generations, the city has drawn on and profited at the expense of the country. As a nation we must now decide whether we will become an industry people or whether we will remain a well-balanced nation by producing sufficient food for the consumption of the cities, so we will not need to support a large navy and army for the protection of a source of food supply from some other country. When war was declared in 1914, it was said that England had enough food to last her but a few days. It was only due to her large navy that the nation was not starved outright. Again, it is a question whether our food-stuffs will not cost us considerably more if we have to depend upon a foreign supply during the next generation. This problem is a national problem. It is not one for the interests of agriculture alone, but it is of equal importance to the industrial, trading and manufacturing centers of the nation.

Art little? Do thy little well,
And for thy comfort know;
Great men can do their greatest work
No better than just so.—Goethe.

The No. 2C Autographic KODAK, Junior

equipped with
Kodak Anastigmat
f.7.7 lens and Kodak
Ball Bearing shutter

\$25.00

This Camera fits into a niche, all its own. The size of the picture it makes, 2½ x 4½ inches, is particularly pleasing; is almost up to the full post card size—and yet the camera itself is small, light, convenient.

The Kodak Anastigmat lenses are made to exactly fit Kodak requirements. They are not merely an adaptation of a lens to the Kodak. They are a Kodak product designed to fit Kodaks, and in each case designed with particular reference to the size and type of Kodak and Kodak shutter that they are to be used with. The f.7.7 lens used on the 2C Kodak has more speed than the best of the rectilinear lenses and is at least equal to the best anastigmats in depth, sharpness and flatness of field.

The Kodak Ball Bearing shutter has speeds of 1/25, 1/50 and 1/100 of a second for "snapshots", has the usual time and "bulb" actions for prolonged exposures. It is an unusually reliable shutter, works smoothly and is quiet in its action.

The No. 2C Junior is covered with genuine grain leather, is finely finished in every detail, is extremely simple in operation, is "autographic", of course and, with the Kodak Anastigmat lens, produces negatives having that crispness and sharpness that are characteristic of the true anastigmat.

The price, \$25.00, includes the excise war tax.

Fertilizers and Seed Germination

An Excess of Soluble Salts May Retard or Prevent Sprouting of the Seed

Dr. J. G. LIPMAN
Director New Jersey Experiment Station

THE SIZE of the crop is the net result of many factors and conditions. Favorable conditions will tend to increase the yield, unfavorable conditions will tend to decrease it. But unfortunately for us we cannot always control the unfavorable factors even tho we may learn to recognize them. We know, for example, that too much water in the soil is almost, if not quite, as bad as too little, and that it is not always possible or profitable to supply the deficiency by irrigation, or remove the excess by drainage. In the same way we know that crops are helped by commercial fertilizer and injured by it when improperly used.

There are many practical questions that pertain to the use and abuse of commercial fertilizers. Not the least important among these relates to the action of the soluble salts in fertilizers on the germination of the seed and the early growth of the plants. Generally speaking, small quantities of soluble salts will hasten germination. This may account for the ancient practice among gardeners of soaking beet seed as well as other seed in very weak solutions of salt-peter or in diluted liquid manure. It will also account for the discussion carried on within recent years in some of the French and Italian journals relative to the advantages of soaking seeds previous to their planting in solutions of certain salts. On the other hand, strong salt solutions will retard or entirely prevent the germination of seeds. In view of the fact that chemical fertilizers are largely dissolved in the soil moisture, and the strength of the solution will differ with the method of applying the fertilizer and the texture of the soil, and that the crop itself is a factor of no small importance, it becomes evident that a careful study of the problem just outlined would be decidedly worth while.

Recent experiments carried out at the New Jersey Experiment Station throw some interesting light on this subject. Seed of corn, wheat, rape, field peas, soy beans, lupine, water-melon, buckwheat and alfalfa was soaked for varying lengths of time in pure water and in solutions of muriate (chloride) of potash, 144 per cent. An examination of the figures just given shows that the amount of water absorbed varies not only with the size of the seed but also with the nature of the crop from which the seed was derived. Thus we note that the seeds of legumes absorbed more moisture than the seeds of nonlegumes. When the seed was soaked in solutions of different strength it was found that

was poured off, the seeds were dried between sheets of blotting paper and the weights determined. It was found that in the case of pure water the different seeds absorbed, in round figures, the following percentages of moisture: wheat, 43 per cent; corn, 30 per cent; water-melons, 80 per cent; buckwheat, 48 per cent; field

equivalent concentrations of different salts produced like results. In other words, the amount rather than the kind of salt in solution determined the effect on the germination of the seed. It was also found that as the strength of the solution increased there was more and more interference with the absorption of moisture by the seed. This is explained by the fact that the presence of any considerable quantity of dissolved salts retards the absorption of moisture by the seed. The latter does not swell so fast and the period of germination is lengthened. When the amount of salt present in solution is increased beyond a certain point the interference with water absorption by the seed becomes great enough to prevent germination entirely. This reminds us, in a way, of the condition that arises when fresh fruits or vegetables are placed in a strong solution of salt or sugar. The brine or syrup cause the fresh fruit to shrivel up simply because they can not only prevent the absorption of water by the latter, but actually draw it out of the fresh vegetable tissue.

The practical application of the facts noted above is obvious. When commercial fertilizer is broadcasted and evenly mixed with the entire mass of surface soil the influence on the soil solution is seldom great enough to cause interference with seed germination. It is only in the case of large applications of fertilizer, and even then in the lighter soils only, that more or less remote danger of injury may arise. The situation is quite different, however, when the fertilizer is drilled with the seed, or applied in the hill or row. Under such conditions we create an opportunity for the formation of a very strong solution of salts in contact with the seed. When the concentration of the dissolved salts reaches one-fifth of one per cent, or 1 pound in 60 gallons of water, danger of injury to the plant arises. It is estimated that 500 pounds of soluble fertilizer uniformly mixed in the upper three inches of very light sandy land will increase the concentration of the soil solution by one-tenth of one per cent. An application of 1000 pounds will increase it by 2 of one per cent, and at 2000 pounds, by 4 of one per cent. In a clay loam soil the corresponding increases in concentration would be from 1-10 to 4-10 of one per cent. When the fertilizer is applied in drill or row the concentration may become ten or even twenty times as great. The reader can therefore draw his own conclusions as to the extent to which the crop may be handicapped in its early stages.

Seedtime and Harvest Shall Not Fail

144 per cent; lupine, 140 per cent; soy beans, 119 per cent; rape, 57 per cent, and alfalfa 144 per cent. An examination of the figures just given shows that the amount of water absorbed varies not only with the size of the seed but also with the nature of the crop from which the seed was derived. Thus we note that the seeds of legumes absorbed more moisture than the seeds of nonlegumes. When the seed was soaked in solutions of different strength it was found that

of growth by the proximity to the seed and young plants of a strong solution of salts. Were it not for the fact that as the plants grow older they are stimulated by the presence of the fertilizer and the early handicap is partly or wholly overcome, the final showing in favor of the fertilizer would not be as good.

The question now arises whether by adopting suitable methods the farmers could not eliminate all the early handicaps and retain all the later benefits. It is generally recognized that while the broadcasting of the fertilizer lessens the danger of injuring the crop early in the season, the final yields are likely to be better when the fertilizer is used in the drill or row. Nevertheless, other methods of applying and distributing fertilizer are not receiving the consideration that they deserve. For instance, sweet potato growers in southern New Jersey, Delaware and Maryland were in the habit, before the war, of using large amounts of Kainit, often as much as one ton per acre. This was usually applied in the preceding fall or very early in the spring. If applied within six weeks or less of planting time it often produced unfavorable results. In the case of cyanamid or lime nitrogen it was found

that it is not safe to sow the seed or to set out the young plants for ten days or two weeks after the fertilizer has been applied. Evidently these fertilizers have to undergo certain changes in the soil or to become widely distributed before the danger of injuring the crop has disappeared. Another method that has been suggested and one which our implement makers will have to study more seriously is that of the application of fertilizers at some distance from the seed; or the mixing of it with a larger volume of soil. Some fertilizer distributors are constructed on this principle. There is room for further improvement in this connection both as to the construction of the machinery and of its use. Finally there is something to be said on the score of applying only part of the fertilizer at planting time, and part of it later; or of applying part of the fertilizer in the row and part of it broadcast. Something on the subject has already been said in these columns at the request of readers of the Pennsylvania Farmer. The matter is deserving of further comment if for no other reason than that of the wider use of commercial fertilizer and its application in constantly increasing amounts per acre as the more intensive

methods of fertilization and cropping are adopted. The importance of the matter will be emphasized more and more as the use of high analysis fertilizers becomes more common, and as the newer and more concentrated chemicals become commercialized to a greater extent. Quite naturally the soil investigators will be asked to produce a lot of new information for the guidance of the farmer. If the fertilizer applications are to be divided, what would be the best amount to use at planting time? Should the side dressing be of the same composition as that used at planting time? To what extent would the texture of the soil and the nature of the crop modify the practice? Indeed, these and other questions are even now undergoing a careful study at some of our experiment stations. Ultimately many practical recommendations will result from these studies. Meanwhile the producers themselves are in a position to make a substantial contribution to our knowledge on the subject by determining under their particular conditions the value of the different methods of applying and distributing commercial fertilizer.

Farmers Adopt Grain Selling Plan

Convention Delegates Unanimously Ratify Plan Proposed by Committee of Seventeen

J. R. HOWARD
Pres. American Farm
Bureau Federation

THE marketing plan proposed by the Farmers' Grain Marketing Committee of Seventeen was unanimously accepted at a big ratification meeting in Chicago, April 6-7-8. One hundred and three selected delegates from the twenty-five surplus grain producing states voted "aye" unanimously at the end of a two-days stormy discussion.

Should grain growers who contract to sell their surplus grain under the plan devised by the Farmers' Marketing Committee of Seventeen be required to pool at least one-third of their grain? This question proved to be the rock which for a day and a half threatened to split the conference.

The final plan submitted by the Committee of Seventeen gives to the farmers composing the local grain growers' association absolute option as to whether their grain shall be pooled or sold outright on consignment thru the National Selling Organization known as the United States Grain Growers, Inc. It developed, however, that there had not been absolute unanimity among the members of the Committee and six of them were ready to defend the compulsory pooling of the grain.

The issue was raised shortly after the plan drafted by the Committee was read to the delegates when C. O. Moser from Texas offered an amendment which provided for compulsory pooling of one-third of all the grain marketed by individuals thru the National Sales Agency. J. R. Howard, President of the American Farm Bureau Federation who presided over the meeting gave both sides equal opportunity to present their arguments on the floor.

The amendment was seconded by Aaron Sapiro, representing the Pacific Northwest Wheat Growers, who made a vigorous argument in its behalf. Only by pooling at least one-third so that the grain could be fed upon the market as it is able to absorb it will it be possible to introduce the plan of merchandising grain. Without it there will be a continuation of the practice of dumping grain which farmers now follow. Mr. Sapiro believed that the plan provided too many options, and that by giving the farmer the opportunity to sell all of his grain immediately, the pooling plan would not be given a real chance. Most growers are familiar with the plan of outright sale or sale on consignment while few of them are familiar with the pooling plan. Without the compulsory feature the number who would volunteer to pool their grain might not be sufficient to stabilize the market and therefore the pooling principle would not be given the acid test

of the survival of the fittest as claimed by the Committee. Mr. Sapiro's contact with co-operative marketing organizations in California has led him to believe that the pooling feature was the life of the proposed plan.

Delegates who opposed the amendment maintained that farmers would be unwilling to sign up for the sale of their grain under the plan of pooling even one-third on a five-year basis. Almost invariably, however, delegates prefaced this argument by the statement that they personally were entirely ready to contract for the pooling of their own surplus grain. The possibility of alienating public opinion by inaugurating a plan which at the start might be construed as a national monopoly was also brought out while some of the legal minded delegates and certain members of the Committee of Seventeen considered it unwise to incorporate the compulsory pooling clause lest such a plan be declared illegal thus imperiling the entire scheme whereas if pooling were made optional, in the case of such legal decision the machinery could continue to operate.

After perhaps one hundred and fifty speeches had been heard for and against the "compulsory pooling amendment" the roll was called. The vote stood thirty-eight for and sixty-one against with two delegates absent. Immediately afterwards the vote was taken upon the ratification of the plan as presented by the Committee and it was passed unanimously.

Preparatory to the submission of the plan to the delegates, speeches were made by J. R. Howard, C. H. Gustafson, Chairman of the Committee of Seventeen, and Henry C. Wallace, Secretary of Agriculture. Mr. Howard stated that farmers were seeking no class privileges but a stabilization of markets wherein the farmer gets the benefit of the economic working, not the effect of the manipulated working, of the law of supply and demand. The Committee of Seventeen made no endeavor to organize farmers for the limitation of production thereby increasing prices with smaller output or to establish monopolistic control. "Only that thing in our marketing plans—and, indeed, in our entire national structure—which will benefit all classes can be of lasting benefit to any."

The New Plan

The principal features of the plan of the committee were made public some time ago. It provides for the establishment of a national sales agency known as the United Grain Growers, Inc., which will be the overhead organization. This corporation is to be a non-stock, non-profit company to be operated on a cost basis. Bona fide producers of grain will become members upon payment of a membership fee of \$10.

Members will then unite in local co-operative elevator companies which must be truly co-operative and pay dividends on a patronage basis, or in local grain growers' associations. The individual grower will contract to sell his surplus grain

for a period of five years exclusively thru the local company or association. The grower may decide to sell his grain outright to the local company, sell it on consignment or he may join with other members of the local unit in a pooling arrangement.

The members of any local pool may elect to unite with one or more pools in the selling of their grain. Under this plan of selling the time and rate of marketing of the pooled grain would be under the direction of a pooling committee of the National Association. Thus the way is paved for the building up a big national grain pool under centralized control.

The local elevator company or local grain growers' association will contract in turn with the national association to handle the grain of its members under each of the plans which may be elected by the individual growers.

The national association will be under the management of a board of twenty-one directors elected by delegates to the annual convention of the association. These delegates are chosen at conventions held in each Congressional district at which each local elevator or grain growers unit is represented by one member. The directors in turn will elect the officers of the national association from among their own number with the exception of the Secretary and Treasurer.

The Board of Directors is authorized to establish such departments as Sales, Transportation, Organization, Legal, Finance, Statistical, Publicity and Pooling.

It is also authorized to organize subsidiary corporations for carrying out its functions or to hold ownership in them. These include branch sales offices at important grain markets to handle the grain for each natural grain district; terminal elevator companies; a finance corporation whose capital stock shall be subscribed by the members as far as possible; facilities for marketing the exportable surplus of grain; service departments furnishing information upon local, national or world-wide conditions affecting the grain trade as well as upon legal, transportation and other problems.

The working capital for operation is to be obtained from the membership fees of growers and later on by deducting certain amounts from the sales of grain handled for which certificates not bearing interest will be given by the national association to the elevator company, which in turn will issue certificates to its members. These will have no definite maturity.

After the adoption of the plan, the Com-

C. H. GUSTAFSON
Chairman, Com-
mittee of 17

Directors of the United States Grain Growers, Inc.

tee of Seventeen divided the United States into twelve grain growing districts allowing to each district one man on the temporary board of twenty-one directors for each 60,000,000 of grain sold.

Twelve resolutions were adopted by the delegates as follows:

That Congress enact legislation permitting farmers to bargain on an equity with purchasers of their products.

That the tariff be revised, to reflect the difference in the cost of producing farm products at home and abroad.

That short selling be prohibited.

That any substitution of a sales tax for the present excess profits tax be opposed.

That the railroads be asked to grant lower freight rates.

That Congress assist in the development of the Great Lakes—St. Lawrence waterway project.

That larger credit facilities be extended to agriculture thru the Federal land banks.

That the Federal Reserve Bank Act be revised to provide more fully for the legitimate needs of agriculture.

That Secretary Wallace be commended for his stand on the question of co-operative marketing.

That the contribution to co-operative marketing problems by the late Dr. Charles McCarthy of Wisconsin be highly commended.

That the profit made by the U. S. Grain Corporation in handling wheat be set aside as a permanent revolving fund to furnish an additional credit for moving crops.

That the directors selected to put the new marketing plan into operation work co-operatively with existing farmers' organizations.—Glenn G. Hayes.

The Pennsylvania Bureau of Markets

One of the Service Bureaus of the State Department of Agriculture

(Continued from Last Week.)

By J. C. GILBERT, Acting Director

Co-operative Associations

THE most significant economic movement in America today is the co-operative movement. Nothing succeeds like team work. Common interests bind men together and the petty differences which have kept them apart sink into insignificance.

Pennsylvania has 164 farmers' co-operative business associations. Some of these were organized under the law of 1887 but since the enactment of the co-operative law of 1919 practically all associations are availing themselves of its privileges.

Co-operation has seemed so simple that it has met with disaster at many points along the line and for the very reason that it appears so simple. No business will run itself no matter what its foundation principles are. More co-operative associations have failed because of lack of proper management than anything else. Very often over-zealous folks organize because of a supposed wrong having been done them by a dealer or group of dealers and without much knowledge of the real facts in the case.

The purpose of the Bureau of Markets in this line of work is not to force co-operation upon the farmers nor even to urge them to write but to help them to choose the right methods in organizing. There are repeated instances where our co-operation specialist has argued against co-operation because he saw no valid reason why an organization should be formed.

Transportation and Storage

The help given is that of reviewing the articles of incorporation and request for charter, assisting in formulating a constitution and by-laws and then in seeing that proper business methods are installed including an adequate accounting system. Many organizations because of lack of knowledge of their affairs have found themselves to have been insolvent for a considerable period before the inevitable crash came. The law of 1919 provides for yearly reports to the department of all co-operative associations organized

as such. These reports are reviewed by the bureau and it is possible to render aid before an association's affairs become hopelessly involved.

By working in close co-operation with the transportation companies in the state the bureau is in position to assist growers and shippers in their transportation matters such as car supply, arrangement of schedules where special service is necessary, icing services and other matters of dealings with railroad and express companies. One relation that the bureau has in this connection is that of advising with shippers and transportation people on methods of packing for shipment, loading cars and the use of proper shipping packages.

The bureau by surveying a producing area before shipping begins renders great assistance to both the producers and the railroads in estimating the number of cars needed to ship the crop.

The bureau stands ready to adjust differences between shipper or receiver and transportation companies.

The development of motor truck routes to move farm products is of importance to the agriculture of the state. Altho the bureau has done little more than inquire about the general use of trucks it will make surveys and assist communities with their truck transportation problems when requested to do so.

Grades and Standards

The whole future of the handling of farm products depends upon the establishment of proper grades. Unless these are established the development of co-operative selling organizations will be very much restricted.

The work of the bureau on this subject is one of the most important of its duties.

No farm product in Pennsylvania lends itself better to work on grades than apples. The State Horticultural Association in 1920 asked the bureau to work out apple grades. The work of the United States Bureau of Markets was taken as a basis and avoiding the mistakes of other states along this line a list of tentative grades was

worked out and submitted to the growers of the state for trial. Their experiences and suggestions covering a period of two years will guide the bureau in its work and within another year a workable set of grades can be safely promulgated.

The Apple Packing Law of 1917 is administered by the Department of Agriculture and has been assigned to the Bureau of Markets for enforcement. This requires a considerable amount of inspection work. During the apple shipping season of 1920-21 the Bureau kept five inspectors on the road all the time visiting the dealers who handle apples. Very few cases of deliberate attempts to defraud were discovered. Practically all irregularities were due to ignorance of the provisions of the law. Letters explaining the cases were sent to the packers of the fruit and we have instances on record of better returns in actual sales resulting from the work of these inspectors.

No grades have been promulgated for any Pennsylvania Farm Products. In the near future, however, hearings will be held on grades for some of the principal farm products, notably potatoes and grain.

It is obvious that in order to have grades that are at all uniform with those in surrounding states they must not be arbitrarily established by any state but by co-operation with the U. S. Bureau of Markets and other state bureaus. Since the United States Bureau has jurisdiction only over products shipped in interstate commerce it devolves upon the states to promulgate and administer the grades within their borders. If there is to be any comparison these grades within the states must be at least similar in the different states. This can be brought about only by co-operation with the United States Bureau of Markets to make the grades established National Grades. An example of this is the U. S. Potato Grades which are gradually becoming adopted in all sections as standard and will be promulgated in Pennsylvania this season after hearings have been held.

The U. S. Grain Standards made mandatory by Congress must be promulgated in this state and as soon as a grain man is secured to take (Continued on Page 9).

Entered as second-class matter at the postoffice at Philadelphia, Pa., under the act of March 3, 1879.

Delegate to Rome

WILLIAM H. STEVENSON, Vice Director of the Experiment Station of the Iowa State Agricultural College, has been appointed permanent delegate of the United States to the International Institute of Agriculture at Rome, according to an announcement just made by the United States Department of Agriculture. The appointment became effective May 1, and was made to fill the vacancy caused by the resignation of Dean Thomas F. Hunt, President of the State Agricultural College of California, who served as the United States member of the permanent committee of the Institute while he was on sabbatical leave from the University.

The Committee of 17

WE PUBLISH this week on page two an account of the adoption of the report made by the Committee of 17. This committee was appointed several months ago and worked diligently, studying the present wheat marketing methods and comparing ultimate prices with those received by farmers. While our territory is not included among the regions or districts covered by the organization, we believe our people will be interested in knowing something of the working plans of so radical and gigantic scheme of marketing as is proposed. As might be expected, middlemen and grain traders ridicule and criticize the plan adopted and prophesy failure. Since it is the biggest co-operative marketing proposition any class of farmers have ever undertaken it is worth watching with sympathetic interest. The committee has done well not to include any features that might be misconstrued by the public as being monopolistic, or of being used to restrain trade.

Salaries

WHEN people talk about salaries of \$25,000 to \$75,000 a year in the railroad business being excessive, they do not stop to think that successful men in all lines of business make more. There is hardly an opera star, or a moving picture star, who does not make more. The public goes to the movies night after night and indirectly pays Charley Chaplin many times as much for getting his face smeared with pie as it pays any man in America for managing a railroad. We are not here arguing for the payment of excessive salaries in any line, but since all business is

Pennsylvania Farmer

May 14, 1921

more or less competitive, and we universally accept that principle as the most practical at present, it is real economy to pay salaries such as will attract and keep men and women who can best do the work required. If we do not, it is natural that they will seek more remunerative places. The present plight of the educational system with regard to teachers is a concrete and costly example.

Crop Conditions

ALL REPORTS indicate a satisfactory condition of crops in nearly all sections of the country. Wheat and grass are making splendid growth and promise big yields. In a few sections lack of rain is something of a menace at present. This is especially true in the Southwest. About the usual acreages of corn and potatoes are being planted. Early potatoes in some Southern districts have not come up well. Cool, wet weather in the Northwest menaces the early potato crop. There is no indication any place of a record-breaking fruit crop. In all places except the most northerly sections the stone fruits will be largely a failure, due to the freezes in March and April. Early apples were also injured in the milder sections where the previous warm weather had forced the blossoms. Because of these conditions, and the fact that freight rates are so high, the wise Eastern fruit grower will bend every energy towards bringing what fruit he has to the highest state of perfection and be ready to take the best possible care of it at maturity.

True and to The Point

THE FOLLOWING is quoted from an editorial in the business section of the Public Ledger:

Are retailers bearing their share of the readjustment of business? Herbert Hoover says they are not. Others in position to speak with authority agree with him.

In a general discussion among business men yesterday all present agreed that with labor liquidated prices must be reduced. The opinion of all present seemed to be expressed by one man who said:

"Raw materials are down to the bone, so to speak. Look at cotton, wool, leather, copper. Look at all the products of the farm. The farmer and the producer of raw material has had to take his medicine. Some of the middlemen have not taken theirs and do not seem inclined to take it, but they must."

"The cost of living must be reduced more than it has been or labor will feel it has been treated unfairly. In many lines of retailing prices are not down except in a small degree. It may be owing to the excessive costs of retailing. We've got too many retail establishments. One-half the number would serve the public better than do the many now in business. Prices of foodstuffs still vary greatly in different localities and sometimes in shops in close proximity. If purchasers exercised more judgment in the distribution of their patronage many concerns now in the retail field would have to lock their doors or put up their shutters."

"There is no warrant for some of the prices charged in restaurants—plain, ordinary restaurants, patronized by men who have to count their diners. The charges are the same in many instances as they were last year, yet coffee has come down from 43 cents a pound to 22 cents, butter has dropped from 80 cents a pound to 43 and eggs and meats in proportion."

"How do they get away with it? And how do the better-class restaurants get away with the prices they charge? It would startle a farmer if he went into some of those places and saw what they got for the products of the farm for which the agriculturist gets little."

Conditions and Prospects

UNTIL very recently people talked one thing and thought another. They acted upon the same principle as the boy who whistles to keep up his courage while at the same time he is shaking in his boots. By common consent, business men in general have talked hopefully and newspapers have spoken optimistically even when things looked the darkest and business was at a standstill. It is well that this was so, else we would have probably had a real panic.

But it can now be truthfully said that business is "picking up." The secret fear that filled men's hearts the past few months is disappearing and they are now whistling, not to keep up their courage but because there is plenty of assurance that we are past the worst and that from this on there will be improvement even though it be slow.

There is general agreement that the lowest point has been reached and that now business is moving on the up-grade. The fact that this feeling exists will be a big factor in expediting the movement.

Governor Harding of the Federal Reserve Board, recently said before a body of business men: "We have passed thru our worst troubles and the problems ahead of us are all solvable. There is now no danger of any general financial trouble in this country." The feelings of optimism and confidence that pervaded the meeting of these hard-headed business men is most encouraging because they are the men who keep a close finger upon the business pulse of the world. The motto of the gathering as expressed by a huge electric sign was, "Greater Prosperity thru Greater Foreign Trade."

We have been trying to point out this fact to farmers during the past few months. It is most short-sighted to adopt a permanent policy which will prevent the re-establishment of a normal foreign trade simply to enable us to realize on one season's crops produced under abnormal conditions. There have been too many fool things said and too many quack remedies proposed to convince the thinking man that all the plans proposed were conceived by men who looked beyond the ends of their noses. Our only serious national troubles are those arising from unsettled international problems. When these are settled and our place in the world's trade resumed, our minor difficulties can be solved readily.

Our Washington Letter

Hearings on the Smoot Federal Farm Loan act amendments will be held before the Senate Committee on Banking and Currency some time this month. The first of these amendments, Senate Bill 431, provides for the liquidation of joint stock land banks. Section 16 of the act creating the joint stock land banks is repealed, with the exception that a joint stock land bank incorporated before July 1, 1919, may continue to operate under the act, with certain restrictions until July 1, 1924, when all such banks must go into liquidation.

A second amendment, Senate Bill 432, provides that the Federal Farm Loan Board shall levy assessments upon the Federal Land banks and joint stock land banks sufficient to pay its estimated expenses and the salaries of its members.

A third amendment, Senate Bill 433, removes the tax exemption features from joint stock land bank bonds.

The avowed object of these bills is to put out of business the joint stock land banks. It is believed by friends of the farm loan system that the real purpose of the proposed legislation is to destroy the farm loan act. They apprehend that joint stock land bank feature being the weakest link in the system, it has been selected as the most vulnerable point of attacking the act. It is at least well known that at least some of the professed enemies of the joint stock land banks are none too friendly toward the Federal farm loan associations.

There is a strong sentiment against tax exemptions of every kind. A movement designed to secure an amendment of the Constitution prohibiting the issuing of tax free bonds, either by the states municipalities or Federal government, is receiving powerful support from many sources, and the advocates of the movement have the use of some excellent arguments. Secretary of the Treasury Mellon estimates that there are now ten billions of tax-exempt securities issued by states and municipalities, constituting an "economic evil of the first magnitude." Wealthy people are investing in these bonds to escape taxation, and the government is seriously feeling the loss of the revenue thus entailed. It is a point worthy of note, however, that the evils of the tax exemption of government, state and municipal authorities were not "discovered" until the farm loan bonds were exempted from taxation.

If the purpose of the farm loan act is to provide money at low rates of interest for agricultural development and production, then that money must be raised in a special market. And up to this time the only way that has been devised for creating a special market in which money can be secured at low rates is that of issuing tax free securities. Hence, the tax free farm loan bonds. From this standpoint, it is argued that the farmers and their organizations have considerable interest in making an effort to save the tax exemption on farm loan bonds, at least until municipal bonds and all other government securities are denied this tax exemption privilege. There is no telling what this Congressional tinkering may do to the farm loan act.

The endorsement of the principles contained in the McFadden-Kenyon rural credit and multiple insurance bill, by the executive committee of the American Farm Bureau Federation, has brought this proposed measure to the front as a constructive farm credit proposition.

The House committee on Interstate and Foreign Commerce has voted not to report out any daylight saving legislation.—E. E. Reynolds.

May 14, 1921.

HARRISBURG LETTER

The Legislative Grist.—It will require all of the three weeks remaining of the constitutional period allowed the Governor to dispose of bills after the general assembly adjourns to thoroughly sift the results of the 1921 session. So many bills were shot thru in the closing week after the House's revolutionary action of changing speakers that the whole force of the attorney general's office has been at work studying the legislation and preparing to advise the Governor. The plan is to devote the next 10 or 12 days to general legislation and the rest to appropriations because by that time it can be estimated what the revenues will approximate. It should be remembered that only the most general statements were made during the session as to the amount of money that could be appropriated and since the session the clerks have been at work for days trying to find out what was voted. The whole situation is one seldom known on Capitol Hill and will require the greatest care by the Governor.

Cleaning House.—Auditor General Samuel S. Lewis, who assumed office Tuesday, gave the Capitol something to think about when he ordered an audit of the ledgers of his department because he said he could not tell the exact situation of the finances. The new auditor general announced that the statements did not satisfy him and introduced methods followed when a post office is transferred. On top of this he proceeded to drop from the payroll seventeen persons, three of whom were found drawing pay in other departments and abolished five "special" places, which he had promised the Legislative League he would do. The net saving will amount to thousands of dollars a year.

The Revenue Bills.—First of the revenue bills to become a law was that doubling the collateral inheritance taxes. This takes effect as of May 4 and just what it will yield is rather problematical. The anti-raricite and gasoline taxes are bound to result in litigation and there may not be as much money to appropriate as estimated by the legislators when they made their guesses in the wind up.

Going After Dog Owners.—Steps for energetic enforcement of the dog license law, which it is expected the Governor will sign, are being taken by Secretary Fred Rasmussen and agents are now at work in several counties sizing up the situation. The first arrests have been made in the east, but in the sheep raising counties things will be started soon.

Change in Game Laws.—Governor Sprout's approval of the Catlin bill, making a number of changes in the game code, makes them effective at once and there is an important new provision in regard to damage by bears or other animals. Such animals or birds as are caught damaging crops may be killed, but the person doing it must report the act and also be prepared to present proof that damage was being done. There is also a definition as to what can be done in the way of pursuing animals causing damage. Steps will be taken at once to get the new provisions before the public, but the distribution of the acts will depend on the printers' strike.

The Prohibition Code.—While the new prohibition code does not please people on either side state authorities declare it will work out and do much toward bringing to an end the situation prevailing of late. And it is also predicted liquor will be the great issue in the next campaign with chances of some strenuous times over legislation in 1923.—Hamilton.

NEW YORK LETTER

Farmers Grow Seed.—Farmers of Cayuga County are organizing to grow certified seed of Cornell No. 11 corn on a large scale. A group of 40 Cornell agricultural students will this week inspect farms of Cayuga County where beef cattle, Jerseys, sheep and swine of high quality are grown.

Cheese Down.—In northern counties cheese has reached the low minimum price for nearly 20 years, or 14 cents a pound, with almost no demand.

Maple Syrup Slump.—Buyers are

offering but 75c a gallon for syrup and 7c a pound for maple sugar to producers in northern counties where there is no organization to market the sweets. Farmers declare it an effort to break organizations, and are holding back. It cost \$1.75 per gallon to produce syrup by the average producer this year.

State Leads in Cows Under Supervision.—For the first time New York leads in the number of cattle under supervision in eradicating tuberculosis. The nearest competitor is Minnesota with 22,216 animals less. The county veterinarian plan has increased the amount of testing and office bank, with others to follow, is co-operating in advancing 75 per cent of indemnity claims to dairymen so that at least partial restocking of dairies can be made at once. The total of once tested free herds in the state was 1,110 at the end of March, and there were 82 Federal accredited herds. Tompkins county alone in April tested 5,560 animals and found but 55 reactors.

Rural School Investigation.—Ten counties have been investigated as to rural school conditions by a corps of noted education experts. Six distinct lines of inquiry are carried on, and all the facts are wanted. The first report will not be ready for some time yet it is found that in the state there are 15 schools being maintained at a cost of over \$12,000 to educate but one pupil each; 52 schools with but 2 pupils each, at a cost of about \$42,000 a year; and 1085 schools with the number of pupils ranging from 1 to 5 each.

Annual Season Opens.—For the first time business looks well for the new crop season. Rates are 20 per cent lower than rail freight rates and terminals are full of freight. Thirteen barge fleets are preparing to open the season.

NEW JERSEY NEWS

New Baby Station.—With the opening of a Baby Keep-Well Station in New Brunswick, the State Bureau of Child Hygiene now has 75 health centers for mothers and babies under its direct supervision. The new station is located in a school building in the Middlesex County city, and will be open every Wednesday from 2 to 4 P. M. For expectant mothers, pre-school children and babies. Another baby station was located in New Brunswick some time ago, and it became so successful that it was decided by the bureau, which is allied with the State Department of Health, to open the second one. These stations throughout New Jersey supplement the visits of child hygiene nurses in the homes, and the combination has been most pleasing in lowering the death rate among babies and in preventing sickness. Mothers are instructed in the right methods of care and feeding before rather than after illness becomes apparent in their babies. Thru this systematic health supervision, defects are promptly detected and corrected before they have had a chance to seriously hamper the child's development.

Women in Farm Service.—A woman's branch of the Morris County Farm Service Exchange is in process of organization at Morristown, the county seat. It is planned to carry on, probably in the same building with the exchange, a business dealing with the things needed in the farm homes. Initial steps were taken in the matter by Miss Cora Hoffman during her term as demonstrator in Morris County and the plans have been carried on by Miss Marion Butters, the present demonstrator.

MARYLAND LETTER

The fruit crop outlook in the western section of the state has been summarized by Lancelot Jacques, Sr., the fruit expert of Smithfield, in a few gloomy words: "There will not be a peach in the Cumberland Valley between Winchester and Harrisburg." The prediction made by Mr. Jacques is based on a recent investigation made of the orchards which shows that the peach crop, compared with even ordinary years, will be so small as to be almost negligible. The same is not true of apples, however, as the investigation just completed shows a fair percentage of apples escaped the two killing blasts of last month.

**TRIPLE WALL
CRAINE
SILO**

The best protection for silage and investment

The Craine is the silo built with triple walls. Outside the inner wall of upright fitted staves is a wall of Silafelt water-and-frost-proofing. Binding both is the spiral smooth-finish Crainelox covering—no hoops, no lugs, no weak spots, but protection in every inch of space. Rain, juice, ordinary frost, air—nothing penetrates the Craine. A permanent building that pays you richly each year.

You can rebuild your old broken down stave silo into a new, permanent, handsome Craine and save half the cost of a new silo. Do it. Write today for full particulars. Get our Agency proposition.

Craine Silo Co., Inc.
Box 140 Norwich, N. Y.

**GLOBE
SILOS**

SEND for the Globe Catalog now and learn why the Globe Silo so quickly earned an enviable reputation.

One reason is its extension roof which enables owners to use every foot of silo they paid for. A few feet of an extra, scientifically built roof made a full silo possible, after silage settled.

Write today for catalog, prices and special discounts on early orders.

Good agents can have open territory.

NEW MILK POOLING SCHEDULE

At last the Dairymen's League has won thru in its campaign to secure the requisite number of signatures to pooling contracts and the new pooling schedule went into effect Sunday, May 1. There has been much conjecture even on the part of supporters of the plan as to the details to be adopted. After intensive study of the many milk marketing problems the League officers announce that milk will be divided into four classes. They have aimed to do away with complaints of dealers that they are forced to buy surplus milk of the League at top prices set by the League.

The price in all classes but the first it is said will be determined by market conditions; in the first class the cost of production and market conditions will be considered. May prices are yet to be determined.

Class one will consist of milk sold in fluid form and milk made into cream with the skim milk sold in fluid form. Production costs will receive more consideration in this class it is understood.

Class two includes milk made into cream and skim milk used in any manner desired by the buyer except that the skim milk cannot be sold in fluid form. It also includes milk to be made into plain condensed milk and in the manufacture of ice cream and soft cheeses.

Class three includes milk used in sterilized, evaporated whole milk, manufactured into sweetened whole condensed milk, made into milk powder, or made into cheese of the Swiss, Limburger and others of similar type.

Class four includes all milk made into American butter or cheese.

With these instructions it is easy to see how prices will range on the various classes if there were no pool to level the prices. The producers must be patient for a time and do all possible to bring about harmony with each other, with dealers and with consumers. This is a big venture, with many ramifications and much is involved. But we are convinced the great majority of producers will agree that this is a firmer basis than milk has ever been sold on in this big eastern territory.

On April 22 the directors voted to put pooling into effect as all but 700 signatures were on hand, and they were coming in at the rate of 150 a day, with eight days remaining before May 1.

Adjusters are being appointed rapidly. They are local dairymen who are officially designated to see to local affairs, pay out checks, hear complaints, etc. The money to meet the monthly checks will be deposited by the League in local banks. It is hoped that dealers will be obliged to pay more promptly than some have and that the former may be able to get his money promptly. In the past many dealers have done business in the farmer's money, holding it a month or two or even more in arrears all the time.—M. F.

JESREY BREEDERS ORGANIZE

A meeting of the Jersey breeders of Susquehanna County, was held in Montrose, Pa., recently. A motion

picture film of Jerseys entitled "Hearts and Jerseys," was presented at the Ideal Theatre, after which the Jersey men adjourned to the farm bureau rooms where the first important step taken for the county breeders was made by organizing under the title of Susquehanna County Jersey Breeders' Association.

All the members seemed to favor the accredited herd plan. Although there are several members on the accredited plan, there is only one of the herds that is now accredited. This herd is owned by Selden Birchard, of Birchardville, who is the possessor of Jap's Cosy 335099 with a record of 6,651.9 lbs. milk, 404.81 lbs. fat at three years, eight months of age, who furnished the fine cover cut in the Jersey Bulletin of Nov. 24, 1920.

The following officers were appointed for the organization: President, Claude Carter; vice president, George Dayton; secretary and treasurer, Selden Birchard. The seven directors including the first named men are E. V. Birchard, W. L. Bailey, Clayton Hall and Frank Smith. The fees for this association has been fixed at \$2 per year.

The association has already made plans to make an auto tour of inspection among the Jersey breeders of the county during the coming summer, and has accepted the invitation of the secretary, Selden Birchard, to partake of a basket lunch at his pleasant farm home in Birchardville. This new organization is due to the zealous efforts of Mr. Fague, the county farm bureau agent, and one prominent dairyman.—E. M. L. B.

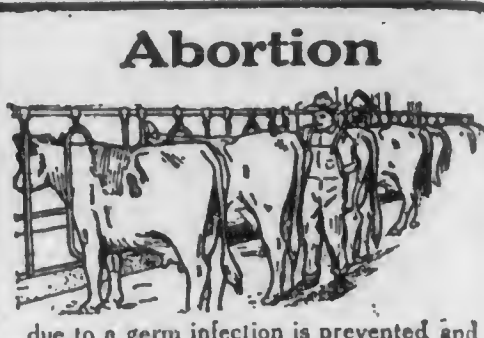

THE HERD SIRE

In selecting a herd bull it pays to buy an animal with the best pedigree that can be obtained for the money. But do not buy on pedigree alone. Vigor and breed type are of great importance. Some bulls will have prepotency which is the ability to transmit certain desirable qualities to their calves. Other bulls seem deficient in this respect. A bull might have the names of several famous sires in its pedigree and yet be a poor animal to use for reproducing cattle.

Not all of the good points of a bull can be told in one or two years. The breeder must wait until the offspring have reached the age of production. Some breeders have found out that the bull which was butchered several years before was really a wonder at producing calves and should not have gone to the block. When a bull has been tested and found valuable it pays to keep him as long as results are good.

If the old bull becomes ugly he can still be held for breeding purposes if given a yard built of cement posts and strong iron bars. Some breeders do not dehorn young bulls but keep them with horns until signs of an unruly nature appear. Then the horns are taken off and the experience serves to quiet the disposition of the animal and make him more easily managed.

A bull needs exercise and it is bad management to keep him in a half dark box stall where he cannot enjoy the sunshine or see much of the other cattle. A small outside pen will

THE LAND TITLE BUREAU, PHILADELPHIA, PA.

Poultry, truck, stock and grain farms, also, FIDGS & NOCK, Salisbury, Maryland.

prove a good exercise yard. The owner can clean the pen when the bull is inside and clean the enclosed stall when the bull is in the yard. A strong easily operated door can separate them while the work is being done. This will make the management of the bull easier and he will receive better care. There will be less danger of accidents.

A strong cable can be used to fasten the bull when taking outside exercise. It never pays to give the animal too much freedom as the gentle bulls often show sudden signs of meanness. It looks alright in the funny paper to see some wild-eyed gentleman being chased by a bull. In real life it is different as those with experience will testify. The farmer who has seen a neighbor after an encounter with a bull is very apt to use great precaution in handling bulls for the remainder of his life.—R. G. K.

THE GOOD THING ABOUT IT

When crises come in the milk business, and they have made their appearance pretty frequently of late, it is difficult to see any bright side to them. Naturally we are troubled over these difficult situations and wonder how we shall be able to shape our plans for the future. Uncertainty robs the man who is inclined to look on the dark side of a great deal of the enjoyment he might otherwise get out of his business. But there is one comfort, at least, and it is one which may lead to a great many others.

The young president of our county Dairymen's League is in considerable demand as a speaker on current movements in the milk business, and as he goes up and down the country, everywhere this is a part of his plea: "Get rid of your poor cows, men. That will do more than any other one thing to relieve the situation. You know which are the cows in your herds that do not pay their way. Sell those cows off. If there is any surplus, which I do not believe, this will be one way of reducing it and it will save you work and lessen the cost of producing milk."

And our farmers are gradually coming to see the wisdom of this advice. The statistics published at Washington tell us that there are more than 6,000,000 farms in this country. Not all of these are devoted to dairying. Suppose one-half of them support cows. On all these three million farms there is no doubt one cow that is not quite what she should be to make her profitable. Let that one cow be sold, not to another dairyman but sent to the meat market and it would cut off a large percentage of milk and put an end to the oft-repeated assertion on the part of milk distributors that the reason why they cannot pay a living price for milk is because there is so much milk they cannot handle it profitably. And, best of all, the cows that are left would be better and bring in a better return, which would be a bright light in a dark day.—E. L. V.

OHIO'S GUERNSEY FIELD MAN

James E. Harper, of Otsego Co., N. Y., has been employed as field man by the Ohio Guernsey Breeders' Association. He will devote his entire efforts to breed promotion work in the state, with headquarters temporarily at Chagrin Falls. The Association was fortunate to find available a man of his qualifications.

Are You in Doubt About
Some Paint Question

**?
This Booklet
Will Help You
IT'S FREE**

As paint manufacturers, we realized long ago that we would be serving and helping our farmer friends if we could impart to them some of our knowledge covering paint and painting.

Different paint jobs usually call for different paint methods of application and many other things that go to make the job wholly satisfactory. Ofttimes, money and time could be saved if the average man and woman could have a ready reference that they could depend upon to safely guide them. In "PAINT POINTERS," we have tried to cover every angle of the painting question. It is full of practical, honest, common sense explanations and suggestions of every conceivable character. Even if you are not thinking of painting, it will pay you to have a copy of this booklet on hand. We would like our many farmer friends to write for a copy. We will be pleased to send it free without obligation whatsoever.

By following its suggestions, you will find that by using a good paint—

NICE **Paint**

—that most lasting results will be obtained.

Remember that for over 45 years we have been manufacturing paint containing only the purest of leads, zincs, oils and other paint pigments. Your dealer will be glad to sell you any NICE product or write us direct.

The value of the manure produced is saved because the cattle are fed in a covered yard. The farm manure is supplemented by a liberal, yet intelligent use of high grade fertilizer. This man knows how to grow plants in the field. These plants for seed production are selected and staked just before harvest.

"The chief factor in the production of this man's phenomenal crops of tomatoes is the fertility of his

HORTICULTURE

Tomato Growing Problems in Maryland

By E. E. REYNOLDS

A BUREAU of raw products research is maintained in Washington by the National Canners' Association. C. G. Woodbury, who has charge of this research work recently made some investigations of the tomato industry in Maryland for the purpose of finding out how the canner may assist the grower to secure more satisfactory returns from the crop.

Mr. Woodbury found that certain Maryland tomato growers are producing some of the largest yields per acre ever recorded for crops grown on a commercial scale. He also found that Maryland average yields are less than they should be. During recent years the average has been about 3½ tons per acre. In 1919 it was only 2.6 tons per acre. Contrasted with this situation are the average yields of recent years in Colorado of 8½ tons, in California of seven tons and in Utah of nine tons to the acre.

What are the reasons for these differences? Mr. Woodbury answers this question by saying that the principal influences which have operated in determining the rise and fall of different parts of the United States in the production of special crops have been markets made available for transportation, a producing population following improved transportation, and fertility of the soil.

As for Maryland, he says that from a study of the influences which have operated in the agricultural development of our country, and of the migration of particular types of crop production from one section to another, the deduction cannot be escaped that upon fertility of the soil, its conservation and its improvement, depends the future of the Maryland canning industry. Tomato yields per acre are better in some sections than in others not wholly, but primarily, because of a better average soil fertility.

"The soils of Maryland have been depleted of their original fertility thru a longer period of cropping than most of the soils of America have been subjected to. This original fertility must be restored thru better farming methods. If the average Maryland yield of tomatoes is to be substantially increased, no program of permanent improvement based upon treatment of symptoms will be successful if it ignores the basic need for improved soil fertility.

"Now let us get down to cases," says Mr. Woodbury. "This is a Maryland question. Let us find a Maryland answer. Over in Harford county there is a farmer, who, last year grew 4½ acres of tomatoes. On this acreage he raised 19.16 tons of tomatoes per acre. He received for his crop \$1699.90 gross income. He realized a net profit of \$218.82 per acre on tomatoes grown for and sold to the cannery, after all charges for fertilizer, manure, horse and man labor, interest, etc., had been deducted. Such a record was worth investigating, and a trip was made to find out how these results had been secured. Why had this grower produced over five times the average yield? The reasons were exactly what might have been anticipated. The grower is first of all a good farmer; the fertility of his soil is being built up by an abundant use of stable manure produced on the farm. This man was formerly in the dairy business with a herd of 24 cows. He sold his dairy herd last year and is now feeding 25 steers. The value of the manure produced is saved because the cattle are fed in a covered yard. The farm manure is supplemented by a liberal, yet intelligent use of high grade fertilizer. This man knows how to grow plants in the field. These plants for seed production are selected and staked just before harvest.

"The chief factor in the production of this man's phenomenal crops of tomatoes is the fertility of his

soil. The soil on this farm is probably a few million years old, at any rate it is just as old as the rest of Harford county, yet by intelligent handling its fertility has been built up during the 19 years the present owner has lived on the farm, until it now produces nearly 20 tons of tomatoes per acre; or from 90 to 100 bushels of corn, or from 175 to 300 bushels of potatoes.

"When this man bought the farm back in 1900 his neighbors said he couldn't raise a crop on such land. In 1919 one of these neighbors raised 200 bushels of tomatoes on eight acres, while this man raised 375 bushels on one acre. There are only 85 acres in this farm, and the owner said that every acre is covered at least once in two years with stable manure at the rate of from 8 to 14 loads per acre. A manure spreader is used, and hauling is done whenever the ground is not too soft. The farm supports three families, the father and two married sons. 'We work pretty well together,' the father said, 'and the farm gives us all a good living, too.'"

Replying to a question asked by Mr. Woodbury as to how the average Maryland tomato grower can increase his yields, Prof. L. C. Corbett of the U. S. Dept. of Agriculture, said he believed that "if the canners were to foster a 'maintain fertility propaganda' which has as its object the use of green manuring crops, supplemented by the proper use of fertilizers, much could be accomplished in the direction of increasing yields."

Prof. Corbett advised the working out of a contract plan which on a 5-year basis as an average, will give the grower as good or better returns than he gets from free or non-contract acreage. "Two other ways in which in my judgment," he says, "canners can be of great assistance to the tomato business, are by discouraging the poor grower in continuing in the game, and by refusing to buy anything except good quality product. The poor farmer, by that I mean one who obtains small yields year after year, almost invariably produces a low grade product. His product is not worth as much to the canner as that of the good grower and by growing a small yield he makes no money from his enterprise."

Continuing his search for an answer to this Maryland question, Mr. Woodbury visited Talbot County on the Eastern Shore. "There," he says, "I went out to see one of the leaders of the farmers' organization movement. He received me cordially, and invited me in. While we sat on his veranda looking across the quiet waters of the inlet, which is at once highway and private fish, oyster and duck preserve, we talked over the history of tomato growing in Maryland. 'You have observed this industry in this region since its beginning; has it proven an asset or a liability to Maryland agriculture?' 'I can answer that best,' he replied, 'by a bit of personal history. Years ago a certain section hereabouts was so poor and poverty stricken that the common saying was that a crow would have to carry his own corn if he tried to fly across it. The folks from that district used to come to our town with string harness, wearing one gallus, and barter their stuff on the street. They were poor and carried all the signs of poverty. I was away from my home county 25 years. When I came back it happened to be over in this district I am telling you about. There had been a wonderful change. Houses were new, buildings were painted, and signs of poverty had disappeared. I found that the change was due to tomato growing and the cannery, which had come in and got established. There is no doubt that the tomato business has been a big asset to our farmers.'"

PENNA. BUREAU OF MARKETS

(Continued from Page 3).

charge of the work Pennsylvania will begin to have the benefits of the nationally standardized grain grades.

In order to protect the buyer of original packages of farm products and to systematize and simplify the handling of fruits and vegetables in the wholesale markets of the state this bureau has begun to standardize shipping packages. The U. S. standard barrels, the U. S. standard Climax grape baskets and berry baskets together with the six basket crate and the 32-quart berry crate have been made standard for Pennsylvania. As soon as U. S. standards have been established for round bottom bushel baskets, hampers and splint market baskets these containers, so far as applicable to Pennsylvania conditions will be adopted as standards for this state.

An amendment to Section 6 of the weights and measures law (Act 445 approved July 24, 1913) is now in the Legislature exempting fruits and vegetables packed in original Pennsylvania standard containers from the weight per bushel provisions of the law. This will remove any possible restrictions to the use of standard containers as shipping and sale packages when they are the original packages, and are filled in accordance with good commercial practices.

When grades for farm products are promulgated their enforcement will call for an inspection service. This season in the potato shipping sections a service of certification for grade will be rendered when requested. This is to be in anticipation of an early announcement of the U. S. Potato Grades as standard in the state.

An amendment to the bureau law now in the Legislature will make possible the establishment of a service of certifying to growers, shippers, receivers or railroads the quantity and condition of shipments of farm products within the state. This sort of service has been rendered only by the U. S. Bureau of Markets in Philadelphia and Pittsburgh or interstate shipments.

With so broad a definition of farm product to work on the activities of the bureau have been constructed with the idea paramount of rendering service rather than that of administering regulations.

Every request for service is met with a definite reply by the bureau.—J. C. Gilbert.

CONTROL OF ROSE CHAFER

The rose chaffer is doing much damage to garden crops, corn, beans and similar crops, according to reports being received daily by the Bureau of Plant Industry, Pennsylvania Department of Agriculture. The only remedy is a sweetened poisoned spray.

In one gallon of water put one ounce of powdered arsenate of lead and two or three tablespoonfuls of molasses. When mixing in quantities use two pounds of powdered arsenate of lead in 50 gallons of water and one gallon of cheap molasses. The sweetening must be added to make it attractive.

Old Settler—No, the people of this town are not what they used to be.
New Settler—No, they used to be children.—Foolscup.

Today is a good day to stop grumbling.

Only \$295 Rock Bottom Prices are Here

EVERY home in North America can now afford electricity. The demand for lower prices has been met. Never before in the history of farm light and power have such values been offered. Think of it! A standardized electric light and power plant big enough for light and small power needs for only \$295.

This price is only possible at this time because of intensive effort directed to engineering and production plus a determination on the part of Auto-Lite to meet the farmer

more than fifty-fifty on price reduction NOW. Rock-bottom prices are here.

Willys Light Junior is a smaller plant. In every other respect it measures up to Willys Light in quality. It is air-cooled, has the wonderful Auto-Lite engine generator and standard voltage. Willys Light Junior puts electric light and power within the reach of every one.

600 Watts—32 Volts—80 A. H. Battery, \$295; 160 A. H. Battery, \$365; 240 A. H. Battery, \$435. All prices F. O. B. factory.

Power and Light with
the Quiet Knight

Now \$525

THIS extraordinary reduction in the price of Willys Light is but further proof of the Auto-Lite ability to produce quality products on a quantity basis.

This famous plant is equipped with the Willys-Knight sleeve-valve engine that improves with use, an exclusive superiority. In addition Willys Light has fifty distinct advantages.

Its wonderful record of success in making home life brighter and farm work lighter, together with its remarkable new low price, warrants you in buying now.

There is a dealer near you ready to serve you.

1,250 Watts—32 Volts—160 A. H. Battery, \$525; 240 A. H. Battery, \$595. All prices F. O. B. factories.

The Beechwood Ventilated Cross-Piece gives a hotter fire!

One valuable economy feature of Beechwood Ranges is their Ventilated Cross-Piece. When your fire gets fairly hot it draws air through this device and burns out the oxygen. You get a much hotter fire, with no more coal.

Cooking-success is so much more certain with a Beechwood. You're free from the mishaps of a "tricky" range. Beechwood Drafts give you a slow or a quick fire, a "baking" or a "boiling" fire just as you want.

Beechwood Enameled Ranges end the muss and bother of blacking. By wiping with a cloth you keep them spotless. The enamel will not crack, craze, chip or discolor. Three colors, blue, brown and gray.

Send for illustrated booklet giving details.

FARQUHAR

The Farquhar principle of separation over insures clean fast threshing. We have manufactured Threshers for nearly 60 years, and our present modern line has been developed by continuous field experience.

Rake Separator shown here is a most practical and economical machine for the farmer who does his own threshing. Made in two sizes with capacities from 350 to 600 bushels of wheat a day. Suitable for Gas Engines 7 H. P. and larger.

Our Vibrator with Self Feeder, Wind Stack, etc., is suitable for large crops and merchant threshing. Improvements giving increased separating and cleaning facilities added this year.

We also make a special Thresher for Peas and Beans, and a Peanut Picker. Farquhar Threshers are best operated by Farquhar Steam and Gas Portable and Traction Engines. Illustrated Thresher and Power Catalogue sent free on request.

We also manufacture Sawmills, Potato Diggers, Grain Drills, Hydraulic Presses, etc. Write us concerning your requirements.

THRESHES CLEAN

Please Mention Pennsylvania Farmer When Writing to Advertisers

BEST EGGS FOR WATER GLASS

The spring eggs are recommended as the best for preserving in water-glass and that is the season when the farmer is most apt to have a surplus. Every consumer that buys eggs for water-glass preserving is running his own little egg storage plant. A large number of consumers saving eggs in this manner will mean a greater demand for eggs during the present over-supply.

Many farmers can obtain more money for the spring eggs not used for hatching if they are sold in ten and fifteen dozen lots to the kind of customers that appreciate quality eggs.

Infertile eggs are the best and they can be obtained in the spring by fencing the breeders on a separate range and producing infertile eggs from the pullets. Thus reduces the danger of the germs starting to develop if the weather suddenly turns very warm or the eggs remain too long under the laying hens.

The nests must be clean so the eggs will be clean. Washed eggs lose the film which nature places on the shell to retard deterioration. Plenty of oyster shells will usually prevent eggs being laid which have weak shells. Such eggs may crack in the water-glass solution from the pressure of the eggs upon them. Customers who buy fresh eggs in large quantities for preserving are apt to come back every spring for another order. It is surprising how well they keep into the winter with this efficient preservative. It should greatly increase the demand for fresh spring eggs when they are plentiful on the farms.—R. G. K.

CARE OF COLONY HOUSES

The colony house that is never moved loses much of its value. The advantage of the system is in the chance to place the growing poultry on clean ground each year. Two moves a year may be advisable if the ground becomes unclean around the house and there is another location available. We believe that houses should be small enough so they can be moved by one horse. A large house is badly wrenched by frequent moving. The fact that it is large and heavy will be an excuse for leaving it in one place. Six by eight feet is large enough for the farm colony houses used for growing poultry.

The floor of the house soon becomes unclean. As it is a dry floor the accumulation of dirt may not be apparent. But it will be very dusty if the birds do any scratching inside the house and this dust may cause colds. So it pays to clean and spray the houses every few weeks and supply them with clean straw litter. Garden loam thrown in a colony house will absorb the dirt but it will also change to dust at once. This makes the house very unclean and we would never place dust or ashes on the colony house floors because of the dust.

One of the coal tar disinfectants makes a fine spray for the brooder house floor and walls. It will destroy germs and keep down mites and lice. These pests cause a great injury to

growing chickens and with feed at present prices none of it can be wasted in helping to fatten and multiply pests.

Colony houses must be locked each night as a protection from thieves. The birds must be released early in the morning to give them the use of the range during the cool morning hours.—R. G. K.

DUCKLINGS DIE

To Little Girl, "M. F." New Jersey—There is a little louse sometimes found on a duckling's head which can hardly be seen, but in a short time it bores into the brain and causes instant death. Grease the top of their heads with a little lard.—M. M. M., Lycoming Co., Pa.

CARE FOR BROODY HENS

It is a great mistake to neglect setting hens during the "breaking up" period. My experience has been that the hen that has the best care at that time is the hen that begins laying earliest. I shut the hen up as soon as possible after she becomes broody. For this purpose I use a slat coop six feet long, four feet wide and three feet high, with no bottom, so that it can be moved about on the grass as a fresh group of setters are ready for it. This coop accommodates five hens nicely, as they must not be crowded.

Perches are given them to rest on and clean water is kept constantly before them. They are fed regularly and have the best of care.

When treated in this way a hen will often begin laying in three or four days after she has been given her freedom, whereas she can't possibly gain strength enough to lay inside of two or three weeks if she has been confined to a small dark space without either food or drink for several days. I know that I am well repaid for all the extra care I give "old broody" besides I can go to bed with a clear conscience.—E. W. O.

CATCHING POULTRY

A net on a slender pole seems the best method of catching birds that are feeding with the flock. We have also used the crook but find that the birds struggle fiercely when suddenly caught by the leg and it may become lame because of the wrenching. The net is quickly slipped over the body of the bird and while there is much struggling, no part of the bird's body receives an undue strain.

The nets can be made by securely fastening a broom handle to a small barrel hoop. A piece of old fish net or even cloth makes a satisfactory covering. The chicken crooks are made by bending a strong wire in the shape of a crook and fastening to an old broom stick. The end of the wire should be made blunt with a file and turned outward so it will not scratch the scales from a hen's leg when snagged by the crook.

The heavier breeds can be tamed so that they are caught easily. But Leghorns are more flighty and much care and patience is required to handle them.—R. G. K.

The Voice of the People

This department is reserved for use of our readers to discuss problems and matters of general farm interest. Write your views and comments briefly on any question of social, economic or educational importance and thus share them with others. Such articles should not exceed 200 or 300 words. Publication of such articles does not signify editorial endorsement or agreement.

PRICE PREDICTIONS AND PRESENT PRICES

The Governor of Kansas last year advised the farmers of his state to hold their wheat for \$3, which at that time, with new wheat selling up to \$2.80, and the cost of twine and threshing higher than ever, would seem to warrant that price. Last December, the manager of the largest flour mill in this section told a number of farmers at a public meeting that wheat would reach \$2 in February, when the best price that month was only \$1.75, and later he told me it would reach \$2 in March, even after a decline of 25 cents. Later, he said it would go to \$2 in May, giving as a reason the short wheat crop in 1920 as compared with other years.

But with the winter wheat prospects so favorable and with so many men out of work, wheat with other grains fell and it is only \$1.25 at this time.

Sometime in March, a great potato grower in New York state said in an article in a reliable farm paper that with the small stock of potatoes on hand at this time of year, compared with the amount consumed that potatoes would advance.

Since he wrote that article, I have seen potatoes drop from 50 cents to 25 cents per bushel with no buyers at that price, and farmers think they will have to feed potatoes to stock to get rid of them.

I mention these facts to show how figures compiled by officials as to shortages of grain and potatoes are often misleading, and that the opinion and advice of so-called experts are not always safe to follow in selling or holding farm products. I was offered \$2.50 for my wheat in August before it was threshed and could not sell because I could not deliver it immediately as I was unable to get a machine except for three-quarters of a day to thresh some of my seed wheat, and oats for feed in the middle of September, the day before I wanted to seed wheat.

It was not until December that I could get a machine to thresh out the crop and then wheat was selling at \$1.65, and I sold 100 bushels from the machine which I could not store in the granary.

Since then I have sold 100 bushels of wheat at \$1.70, the same amounts at \$1.60, \$1.50 and \$1.25 and have some left. A few farmers sold their crop at \$1.70 in February to a local miller, but there is more wheat and corn held on farms this last week in April than I ever knew in the 27 years I have had wheat to sell.

My practice has been to sell about half of my wheat from the machine in August and hold the other to sell early the following year, and this year only shows that my custom would have been a good one to have followed again, could I have threshed in time. Of the wheat threshed in September, I sold 50 bushels for \$2.45 which I did not need for seed.

To grow good crops of grain is a pleasure, but to know when to sell to get the best prices is a different proposition.—J. N. Glover, Union County, Pa.

WORTHWHILE THINGS

In an editorial not so very far back we read "many worth-while things are not procurable by money or politics." Nothing ever was truer but money is so scarce and so very essential here on the farms that, in our wild scramble for a little of it we forget most of the truly worth-while things, or if we do not completely forget them we are so absorbed in other interests that we pay no attention to them.

When I recall the "good old times before the war" they seem like a very pleasant but very remote dream. Will America ever again know the comparative freedom from care and worry and responsibility that we used to enjoy in those days? The prospect of better times in the near future certainly looks very doubtful and even if we should eventually attain a degree of financial prosperity the shadow of these calamitous times would still remain. I am neither a pessimist or a calamity howler but surely we have little time or opportunity for the worth-while things of life. After all, are not the modern conveniences more or less comparative anyhow? I took my little daughter to a teacher's institute with me and during the week we visited a rich aunt and a well-to-do cousin. At both places they had electric lights, bath rooms, and many things we do not have at home and when I told the child "we are going home tonight" she began to cry. I was astonished because she thinks so much of the people at home and never has been away from them much, but she had become surprisingly attached to the unaccustomed comforts—they were not luxuries, every farmer ought to have them all but, unfortunately, few of us do. Later the girl and I went where there were fewer conveniences than we have and she was so desperately homesick that her dread of going back to the place was almost pitiful.

People talk about the "simple life" but in some ways I don't like too much simplicity. I don't mind eating on a white oilcloth or even on the ground under a tree but I do like a nicely baked cake or pie and an oven that will bake them decently. I don't mind sitting in a kitchen chair but I don't like wind enough in the house to blow me out of it. I don't care in the least for especially fashionable clothes, but I do like enough for comfort, of a quality that will hang together.

Until farming comes into its own; at least, to some extent, and farmers are able to buy the necessities of life we can't hope to have many of the truly "worth-while" things, but we do have enough books, papers, magazines, etc., so that we are not so entirely ignorant and heathenish as most city people picture us. Perhaps when city schools are abandoned and all are centralized in the country our dream of these worth-while things may come true.—E. M. A.

Good habits are not made on birthdays nor Christian character at the New Year. The worship of character is every day life.—M. D. Babcock.

A pipe's a pal packed with P. A.!

Seven days out of every week you'll get real smoke joy and real smoke contentment—if you'll get close up to a jimmie pipe! Buy one and know that for yourself! Packed with cool, delightful, fragrant Prince Albert, a pipe's the greatest treat, the happiest and most appetizing smoke-slant you ever had handed out!

You can chum it with a pipe—and you will—once you know that Prince Albert is free from bite and parch! (Cut out by our exclusive patented process!) Why—every puff of P. A. makes you want two more; every puff hits the bullseye harder and truer than the last! You can't resist such delight at any stage of the game.

Prince Albert is sold in tippy red bags, tidy red tins, handsome pound and half pound tin humidors and in the pound crystal glass humidor with sponge moistener top.

Settle the Harvesting Question Once for All

THERE are unusual advantages in settling the harvesting problem once for all this year.

There are two things to accomplish if you make a profit in 1921. You must farm economically and you must farm well—that is, get the biggest possible crops from your land at lowest cost.

An E-B Osborne Harvester bought now will help. You can be sure of your harvesting being done right, without loss or waste, not only this year but for many years to come.

Into the E-B Osborne Binder has gone the benefit of 60 years experience. Thousands and thousands are in active use. Their light running, perfect tying and long lasting qualities are known throughout the world. See one on your E-B dealer's floor or write for catalog.

What One Gallon of Kerosene in a "Z" Engine Will Do for You

Have your local "Z" dealer tell you about these many big advantages:

- 1—Economically uses kerosene as well as gasoline.
- 2—High tension magneto eliminates batteries and battery troubles—gives hot spark, quick starting.
- 3—Throttling governor assures steady speed and close speed regulation.
- 4—Suction fuel feed—no pump—simple and positive.
- 5—Convenient speed controller gives change of speed while engine is running.
- 6—Renewable die-cast bearings.
- 7—Positive lubrication.
- 8—Automatic in operation, requiring but little attendance—easily started.
- 9—Fairbanks-Morse quality throughout.

TALKS WITH THE BOYS

LETTERS FROM THE BOYS

Dear Editor—I have just finished reading the Boys' Page and hope it will always be our page.

In the April 16th issue, William J. Fryer asked for information about making houses for the raising of pigeons. For quite a few years there were no pigeons around our barn until last spring, a pair was there and hatched their young up on a log in the barn. One morning when the squabs were about 2½ or 3 weeks old, I found the female lying on her back on the barn floor below the window, which they entered to go to their nest and she was dead. I think she forgot herself and flew against the window pane instead of going out the opening at the window and this caused her death. This ended the pigeon business, until this spring when a pair came back again. I have sold one squab that they raised and there is a pair of young squabs out just now.

We have a slate roof on our barn which is not comfortable for pigeons because in the summer it's too hot and in winter it is too cold for them to rest on.

The house I prefer for pigeons is the old way to nail a piece of board between two logs. When we built our barn the carpenters made holes or houses for them. The pair of pigeons I have, used the house I nailed up for them. It is just a box 16 inches long, 14 inches wide and about seven inches high. In the middle of one side is an opening 4 inches wide and 7 inches high.

Here is the one I prefer and it is the easiest one to make. Take a board one foot wide and one long enough to reach from log to log. In some places I have noticed that they nail a board about five yards long up against the logs. This, of course, gives as many houses as there are room for on the board.

This afternoon I was trying to fly a kite. I could get it up real high in the air, but it came down as quickly as it went up. Can anybody give me information to make a kite that will fly?—S. R. Snyder, Lanc. Co., Pa.

Dear Editor—I am 11 years old and live with my parents on a farm of 150 acres. We have 14 steers, 7 horses, 9 Holstein cows and 6 heifers and about 350 chickens. I tend the chickens and help with work. I harrow, mow grass and a lot of other things. I am raising a calf and call him "Billy." We are going to farm about 17 acres of tobacco again this year. I help to work at it until school starts. The school where my sisters and I go is about a mile away. We go to Sunday School every Sunday.

We have two autos, a truck and a touring car. Last year we had over a thousand bushels of potatoes but they did not bring a very fair price. We planted about five acres in potatoes last week. There are no boys' clubs around here, but if there were, I would like to join. I like to read and have a small library started. I have some of Alger's and some of Zane Gray's books.—Jay Harold Eshleman, Lancaster, Pa.

Dear Editor—I live on a farm of 77 acres and am in the sixth grade in school. Mrs. Warner was our

teacher before school closed on April 1.—Kenneth Blaisure, Susquehanna Co., Pa.

Dear Editor—I am fifteen years old and am in the senior class in high school. I received several cards for perfect attendance.

We own two farms, but do not farm them ourselves. I have two sisters in Akron, O., and one brother at home. We have a player piano and a phonograph and we all enjoy the music very much.

My father is a great hunter. This winter he killed ten foxes, ten skunks, six raccoons, and every deer season, he usually kills a big buck.—Carl R. Stoner, Center Co., Pa.

Dear Editor—I am thirteen years old and live on a farm of 70 acres. I am in the eighth grade in school now, and expect to go to high school next year.

We have eleven cows, four horses, ten pigs and a great many chickens. Father gives me money for taking care of the pigs.

We have a gasoline engine which we use for sawing wood and for pumping water to the barn.—Harry Cassel, Dauphin Co., Pa.

Dear Editor—I am nine years old and am in the fifth grade in school. Our farm consists of 100 acres and is situated along a river bank. We have 8 cows, one which I milk, two horses, 50 chickens and two hogs. I do chores, harrow and help to fix the fence.—George Miller, Wyoming Co., Pa.

Dear Editor—I am very much interested in the Boys' Page and wish all boys would be the same and help us out with the boys' letters.

I think a good plan for the boys to take an interest in it, is to start up a club in your home place. I have joined a club called the Willingboro School Garden Club.

I have two teachers, their names are Miss App and Miss Ivins. I like them both very much and like to go to school.—Wm. G. Hunter, Burlington Co., N. J.

Following are the names of some of our boy friends whose letters to us we have thus far been unable to publish. We have enjoyed reading these letters and are sorry that on account of lack of space we have not been able to share them with the readers of the Boys' Page. We hope that we may have more room later. Meanwhile, who is going to write us the best letter about kites so that S. R. Snyder, Lancaster Co., Pa., can build one which will fly as it should? J. W. Havens, Monmouth Co., N. J. Ward Kittle, Bradford Co., Pa. Harry Snyder, care of W. D. Beck (no address).

Lee Wench, Chemung Co., N. Y. Jeremiah Shaeffer, Carroll Co., Md. Clifford Horton, Bradford Co., Pa. G. Emory Gottwals, Caroline Co., Maryland.

Hugh W. Seavers, Dauphin Co., Pa. Francis Remy, Orange Co., N. Y. Chester W. Bennett, Bradford Co., Penna.

Maynard Pipler, Bradford Co., Pa. Paul Musser, Lancaster Co., Pa. Norman C. Miller, Beaver Co., Pa. Walter Stine, Juniata Co., Pa. Raymond Sweet, Bradford Co., Pa. Kenneth Storch, Bradford Co., Pa.

SPRYWHEEL

The \$150 Tractor

F. G. B. Boston, Mass., Crating Extra

Multiplies Man Power by Five from Seedtime to Harvest

Will Your Garden Profits be shaken up or down?

Every dollar you save in the cost of raising crops is a dollar added to your year's income. Every extra bushel you get from using your own time and labor and that of your hired help to better advantage is additional clear profit. Shake your crop cost down, and a shake down in prices will not mean a shake down in profits—whether you operate a half-acre kitchen garden or a hundred-acre truck farm or nursery.

How Sprywheel shakes down crop costs and increases crop profits

Timely and thorough cultivation is the first essential to successful farming and gardening. Farm experiment stations have proved that frequent cultivation right through the growing season is extremely profitable—even when this work is done with hand and wheel hoes. This is work that Sprywheel does at one-fifth the cost. Sprywheel practically eliminates hand hoeing. It isn't a substitute for horses and big tractors. We don't recommend it for everything from breaking new ground to grinding grain, sawing wood and cultivating young lettuce and onions. We can't imagine any one machine that could possibly do all these jobs equally well.

But we do recommend Sprywheel for any work a wheel hoe or a hand hoe can be used for. Hundreds of farmers and market gardeners have proved to their complete satisfaction that one man with a Sprywheel can do more and better work than any five men with hand tools. It "Multiplies man power by five from seedtime to harvest" and keeps crop costs down.

A money maker for the market gardener

A market gardener often cuts down his acreage and spaces the rows wide apart so that most of the cultivating can be done by horse power. Using the Sprywheel he can avoid both these wasteful expedients on high priced, heavily fertilized land. He can plant rows close together and cultivate

every row as often as necessary—simply multiply his yield and his profits. Sprywheel keeps down the weeds, loosens and mixes the soil thoroughly, conserves soil moisture and stimulates rapid growth right up to maturity—long after the plants have grown tall and spread into the rows so that horses and multiple row cultivators can no longer be safely or profitably used.

"You can sure recommend it to your best friends"

Here's a mighty interesting document. We sold Mr. Barnes a Sprywheel last year by mail and never heard from him till we received the letter reprinted below which he wrote to Mr. Brock. It is his report on the Sprywheel without service. Now you get your Sprywheel with the best of dealer service.

Harrison, Ohio, March 8, 1921.

Jerry Brock
Newtown, Ohio.

Dear Sir:

In regard to your letter asking how I like my Sprywheel will say I raised 600 bushels of onions in 1919; labor cost me \$225.00. In 1920 with the Sprywheel I raised 640 bushels on the same acreage; labor cost me \$25.00. Although I put my rows 14 inches apart for the Sprywheel, instead of 12 inches in the old way, you will see my crop was heavier and labor cut \$200.00 on the onions alone. I would not take one thousand dollars for my Sprywheel if I could not get another. You can sure recommend it to your best friends.

Yours truly,

HUGH BARNES.

P. S. In addition to the above I tended my corn, potatoes, etc. In fact, I didn't have a horse on my place after the plowing in the spring.

Makes home gardening and lawn mowing pleasant work

Besides tools for weeding, mulching, hoeing and hilling, the Sprywheel Lawn Mower Attachment converts Sprywheel into a power lawn mower in less than five minutes. Just loosen

two bolts and drop off the tool assembly. Bolt on the lawn mower attachment and you have a remarkably sturdy, simple and efficient power lawn mower. Equipped with a Sprywheel the home gardener can work a larger garden and keep extensive lawns in presentable condition without hard drudgery—merely an occasional hour of pleasant exercise.

Sprywheel work and cost of operation

Sprywheel pulls sets of rakes, cultivator teeth, right and left hilling chovels, a row sweep or a small plow for running seeding furrows at from 1 1/2 to 4 miles an hour. It enables one man to cultivate 13 miles of single row in a day, considerably more with a two or three row attachment. One gallon of gasoline runs a Sprywheel all day.

Sprywheel's improved fuel economizer

One of the many engineering improvements which Sprywheel embodies is the Sprywheel Slow Speed Plug. It applies a new principle of carburetion—gives greater power at slower speed with a real saving in gasoline consumption. With the slow speed plug you get maximum horse power at 1 1/2 to 2 1/2 miles per hour.

Remove the plug and you get the same horse-power at 3 1/2 to 4 miles an hour—two speeds and no gears. It's a great invention.

Leading implement dealers demonstrate and sell Sprywheel

Sprywheel is sold by authorized Sprywheel agents who are granted exclusive territory. Write to-day for a Sprywheel catalog and the name of the nearest Sprywheel dealer. There is still a little open territory. It will stay open till we find a live dealer. If you are the man we should tie up with, write or wire.

Value of Grinding Grain for Stock

Experiments Show that Animals Make Better Use of Grain When it is Ground

By R. H. MECKLENBORG

MANY experiments have demonstrated that when corn and oats are fed alone, and corn and oats in combination, that 22.8 per cent of the corn passes thru the animal undigested, and 12.1 per cent of the oats; and where oats and corn are fed together, 26.5 per cent is lost. More than 22 bushels of every 100 bushels of corn fed to the animal are not utilized, and twelve bushels of every 100 bushels of oats are lost, and 26 bushels of corn and oats combined. These figures make the loss involved very prominent and should convince the feeder that this loss would represent a very nice profit had he ground the grains.

These tests were made in animals with good teeth and in a healthy condition. If the animal's mouth is tender, or diseased, and the teeth in bad condition, the loss would be still greater. Often, when the animal is taken from grass and given whole corn, the mouth becomes very tender, a condition which prompts the animal to swallow the grains whole. Again, gums become diseased and teeth rotten, a condition which further prevents mastication.

It has been demonstrated that a greater percentage of ground grains is utilized if the grinding is done fine. When the grains are small and cracked, the particles are more liable to be swallowed without the proper mastication; but if finely ground, grinding by the teeth is unnecessary for the food is then in condition to be transformed into a nutrient state by the action of the digestive juices in the stomach and intestines.

The percentage of kaffir corn and milo-maize which pass the animal undigested is even greater than in Indian corn. These grains are small and hard, rendering them difficult of mastication, hence the animal is very apt to swallow a third, and sometimes one-half, in whole state. As a result in feeding kaffir corn and milo-maize it has been found very economical to grind the grains together with a portion of the stalk.

In feeding the dairy cow it has been demonstrated that ground oats and corn combined together with roughages made a gain of approximately 3 pounds more of milk per day with a corresponding increase in butterfat, than where the same amount of whole grain was fed with the same amount of roughages.

With respect to the feeding of steers, it has been found that finely ground corn meal together with other concentrates and roughages made a gain of nearly one-half pound more per day than those fed on the same amount of whole grains, together with an equal amount of concentrates and roughages. Again, in feeding calves it is more economical to grind the grains very fine than to feed whole grain at any time. In fact, from every standpoint, both in securing a better mixture and more complete digestion, it is to the feeder's advantage to grind his grain.

Extensive experiments in feeding alfalfa hay have demonstrated that 75 pounds of finely ground alfalfa will make a gain equal to a 100 pounds of alfalfa not ground. Probably a part of this is due to the fact that there is less loss in feeding the material when ground than in bulk.

Lane, of the New Jersey Station, compared broken ear corn with an equal weight of corn-and-cob meal with the results shown in the table. The table shows the return from the corn-and-cob meal exceed those from ear corn by 9.4 per cent for milk flow and 4.5 per cent in the yield of fat. The returns as accomplished in favor of grinding corn are not materially different from those derived with fattening steers and swine.

Average ration.		Average Daily Yield Per Cow	
		Milk lbs.	Fat lbs.
Lot 1—Ear corn, 6 lbs.; Corn Stover, 10 lbs.; Wheat, bran, 6 lbs.; Hay, 9.4 lbs.	20.2		0.89
Lot 2—Corn-and-cob meal, 6 lbs.; Corn Stover, 10 lbs.; Wheat Bran, 6 lbs.; Hay, 9.4 lbs.	22.1		0.93

Woll of the Wisconsin Station compared ground oats with wheat bran in a feeding trial with four cows lasting 47 days with the results as shown in the following table.

Ground Oats Compared with Wheat Bran		
Average ration.	Milk lbs.	Fat lbs.
Lot 1—Ground oats, 10 lbs.; clover hay, 6 lbs.; corn meal, 2 lbs.; corn stover, without limit.	23.3	1.03
Lot 2—Wheat bran, 10 lbs.; clover hay, 6 lbs.; corn meal, 2 lbs.; corn stover, without limit.	20.8	0.93

This table shows a return of about 11 per cent more milk and fat from ground oats than from wheat bran. The high feeding value of oats for the dairy cow is well illustrated in this trial.

The following percentages are offered by the Michigan Station to show the average amount of grain left whole when fed to cows:

Corn	Percent	22.8
Oats	Percent	12.1
Corn and oats	Percent	26.5

These figures indicate how profitable it is to grind grain for cows.

At the Wisconsin Station, Henry fed whole and ground oats with corn meal to 115 lb. pigs

A Modern Feed Grinder

for 60 days, with the following results:

Whole Oats Compared With Ground Oats		Aver. Feed for	
		Aver. Daily 100 lbs.	Ration Gain
Feed.		lbs.	lbs.
Whole Oats—Lot 1, 2 1/2 oats,			
1/2 corn meal	2.8	0.68	564
Whole Oats—Lot 2, 1 1/2 oats,			
3/4 corn meal	4.0	0.82	492
Ground Oats—Lot 1, 2 1/2 oats,			
1/2 corn meal	4.4	1.03	429
Ground Oats—Lot 2, 1 1/2 oats,			
3/4 corn meal	5.1	1.27	402

It is observed that the pigs receiving the whole oats ate more feed and produced poorer results than those fed ground oats. The best returns were derived with a ration of one-third ground oats and two-thirds ground corn. With both trials the feed requirements for 100 lbs. of gain were very low where ground oats were used, proving the high value of ground oats when combined with corn.

In the case of horses, it is always advisable, especially if a horse's teeth are poor, or they are over-worked, to grind the oats. Again, ground corn will be found a most desirable grain for the horse. It is a good plan to mix the two feeds; that is, ground oats and ground corn, and not change abruptly from one to the other. With new corn there exists a probability to produce indigestion and often-times colic. It will be found much safer to feed ground ear corn than shelled corn, for the reason that the corn on the cob remains in a better state of preservation and the horse is more apt to thoroughly masticate the grains. Corn being a carbohydrate tends to add fat, especially if the animal is idle.

Barley is also a splendid feed for horses and when mixed with ground wheat gives very good results.

It should be evident to the feeder that it is an unnecessary expense to haul grain to a mill

to be ground when it can be just as satisfactorily ground at home, thereby saving the mill charges, the time and expense of hauling, combined with the advantage of grinding as much or as little feed as necessary and feeding it fresh. A feed mill will pay for itself in a very short time.

There are so many conditions which effect successful grinding of grain that it is necessary for the feeder to exercise considerable good judgment in the purchasing of a feed mill.

Principal among these conditions is the capability of the feed mill to withstand the speed that is a very essential factor in grinding grain. It should be ground. The average feed mill operates at a speed of 500 to 550, whereas, practically all experience shows that a speed approximating 850 RPM will grind grain to better satisfaction. It is true enough that speed as a general rule is not a desirable condition, but the feed mill should be of such construction as will prevent the main shaft and bearing from becoming heated.

The outboard or third bearing is another feature that will play a very important part in the life of the mill. This method of construction will be appreciated where tractors or large stationary engines are used and will prevent bending and other troubles.

A good many feeders are using too short belt. Feed mills consume considerable power and every possible move should be made to assist the engine in transmitting as nearly as possible full rated power. A belt is the transmitter of power, and when a too short one is used the effect is a tight belt, permitting of only about 10 per cent of the pulley surface being lapped, is readily seen that the feeder is in that case using only about 40 to 50 per cent of the rated horsepower of his engine. Whereas, if a larger belt is used, say 50 to 75 feet, the belt will naturally sag and cover a large pulley surface and bring to the mill a greater part of the actual rated horsepower of the engine.

With reference to the pulley, insist upon the mill being equipped with a pulley to produce proper speed. It might not be amiss to repeat here the rule for determining the proper size pulley. Multiply the speed of the engine, or tractor, by the size of the pulley on the engine or tractor and divide this figure by the correct speed of the mill. This result will give the correct size of the pulley.

THE FIRST CULTIVATION

On the effectiveness of the first cultivation the corn crop will depend largely the ease of value of all the subsequent cultivations. If we make the first cultivation thorough, kill the weeds and leave a loose layer of soil on top of the ground we will be well started in growing corn. After the corn has been planted two or three days, or just after it emerges well from the ground, a light harrowing with a spiked harrow, with the teeth set well back, acts as a cultivation, though such a cultivation is not deep or thorough as that which should be done the first time with the riding cultivator.

One of the hardest things to accomplish in cultivation is to keep the weeds down. If we do not get them on the first cultivation they will be much harder to get on the next, and by the time we go over the corn the third time they are big to be cut out by the cultivator shovels so they must be hoed out or pulled, both of which are slow, tedious operations.

Cultivate deep enough to move all the topsoil for at least two inches deep. We can go deeper than that, twice that deep if we can, for there is little or no danger of injuring the young corn roots which are just beginning to feel their way out. A pair of long fenders set next to the rows will admit of very close cultivation so that little weeds right close to the hills will be got rid of. Some farmers whose ground is harder keep rid of weeds go right in with their cultivators as soon as they can see the corn rows in the field. Use the right kind of shovels and keep them sharp. It is difficult to secure proper penetration if they are dull.—J. L. J.

Soils and Fertilizers

Conducted by Dr. J. G. Lipman

Our readers are invited to send us their problems on soils and fertilizers and they will be answered by Dr. Lipman in this column.

IMPROVING A ROUGH FIELD

We have a pasture field on a side hill facing southeast. It is very rocky and untillable. It was badly grown up with brush which I had cut and this was followed by a luxuriant growth of blackberry briars. There is also a large patch of ferns. Can you suggest anything better than spraying for getting rid of these and the briars? If not what spray would you advise? I don't care to burn it over for it is next to the woods and might get beyond control. There is also considerable moss in spots. The field is possibly two acres, but it is very necessary as the tillable acreage is small and not much pasture land. I wrote my dealer about basic slag but he informs me he cannot sell sufficient quantities to permit his handling it, but offers phosphoric acid instead. The presence of moss, I understand, indicates a superabundance of acid already and I am wondering if pulverized lime would not be better. Will you kindly advise me? Anything that is used must be as a top dressing. Could I sow permanent pasture grass seed in the fall or should it be done in the spring? What about nitrate of soda or it that too expensive to be profitable?—Mrs. H. P. C., Pennsylvania.

Among the spray materials that have been used more or less successfully for destroying weeds and other objectionable vegetation mention may be made of fuel oil, arsenite of soda, common salt, sulphate of iron (copperas) and sulphate of copper (blue vitriol). Each has its uses under special conditions, but for your purpose none of these would prove satisfactory. It is obviously not your aim to make the land more or less permanently barren, nor to run the risk of burning your woods, nor to expose your livestock to the danger of poisoning. By cutting the briars and blackberry vines occasionally and by applying suitable kinds and amounts of fertilizers you would encourage the development of nutritious grasses and in time convert the field into a good pasture. The present moderate cost of commercial fertilizer should permit you to improve your land without making too large an investment. A mixture of acid phosphate and steamed bone meal, reinforced with some nitrate of soda, should produce good results. This mixture may be made up of 200 pounds acid phosphate, 300 pounds bone meal and 100 pounds nitrate of soda, or a total of 600 pounds per acre. Under this treatment the pasture will show gradual but steady improvement, and the amount of fertilizer applied could ultimately be reduced to 300-400 pounds per acre. If it is your wish to hasten the entire elimination of the blackberry vines and ferns, the use of burned and slaked lime would be advisable rather than of raw, ground limestone. It would be necessary in that case to apply about 1500 pounds of slaked or hydrated lime per acre. Because of the tendency of the lime to depress the availability of the phosphoric acid in bone meal the fertilizer application should in that case be modified to consist of 400 pounds acid phosphate, 100 pounds bone meal, and 100 pounds of nitrate of soda per acre. After the initial application of lime, the mixture of acid phosphate, bone meal and nitrate of soda, when used annually, should suffice for keeping the land in a reasonably sweet condition. If the land is not too stony and rough for a spike tooth or acme harrow permanent pasture grass seed could be sown with some oats in the spring, or with some winter wheat between August 15th and September first.

Do not refuse the employment which the hour brings you for one more ambitious.—Emerson.

THE CURING OF SICK SOILS

After growing on the same soil for one or more years crops often fail to produce satisfactory yields. It is said in such cases that the soil is sick of that particular crop. Soils are thus designated as being "clover sick," "flax sick," "tobacco sick," etc. In most cases the failure of the crops to produce large yields is due to attacks by fungi or bacteria responsible for specific plant diseases. When any given crop is grown continuously on the same land, the disease organisms will become more common in that locality and may often persist in the soils for weeks, months and years. It should be remembered, of course, that diseases of plants do not always account for so-called soil sickness. Not infrequently crops are seriously injured by the presence on their roots of plant lice. Ell worms are another common cause of injury to plants. They are particularly troublesome where the winters are mild and the soil is not frozen to any considerable depth or for any considerable length of time. These ell worms, or nematodes as they are frequently called, cause very extensive damage to citrus groves in Florida and to many other field and orchard crops. Practically the subject of soil sickness has been studied from many angles. One of the agricultural leaders of Germany stated with a great deal of force about the middle of last century that, if the German farmers could only learn how to grow clover, many of their ills and difficulties would be done away with. Apparently, the failures of clover created serious difficulties for the

tigation. Fruit growers and vegetable growers, as well as general farmers, will benefit from this type of work.

Recognizing the fact that the disease organisms attacking plants may be carried on the seed, cuttings or young plants, intelligent growers try to use in so far as it may be possible clean seed or healthy plants. Well known methods of seed treatment, such as soaking in formaldehyde or corrosive sublimate or the treatment with hot water for a certain length of time, are intended to rid the seed of disease organisms that may adhere to the seed coats. Similarly, in the case of tomato, cabbage, sweet potato and other plants transferred from greenhouse beds or cold frames into the open field, certain diseases may be carried on the young plants. By suitably treating the soil and seed beds much can be done toward protecting the crop against infection in the early stages of growth.

Very often seed or plant treatment is not sufficient to protect the crop against plant diseases. The disease organisms may survive in the soil and, under such conditions, nothing save soil sterilization or some other form of soil treatment that would destroy the disease organisms can give satisfactory protection to the crop. A few years ago, when methods of soil sterilization were not as well understood as they are today, crop rotations seemed to be the most promising means for reducing losses caused by plant diseases. It was known that potatoes would be relatively free from scab when grown only once in five or six years, or that one good catch of clover was reasonably certain in every six or seven years. In the case of some crops longer intervals seemed to be desirable as, for instance, in the growing of sainfoin on the chalk soils of England or France. The belief seems to be correct among the farmers of Wiltshire in England that sainfoin should not be grown more often than once in fifteen or twenty years on the same land.

Instead of waiting for the gradual starving out of disease organisms or injurious insects by means of crop rotations, methods are now available for ridding the land of these enemies quite promptly and effectively. The use of steam or of hot water for the partial sterilization of greenhouse soils is not new. The use of chemicals for the same purpose is, however, more recent. Among the chemicals that have been successfully employed for this purpose mention may be made of formaldehyde, carbon bisulfide and toluene. Recent experiments in France seem to indicate that sulfide of lime used alone or in combination with certain coal tar products may be a cheap as well as an effective means for restoring sick soils. Among the coal tar products liquid carbolic acid and related compounds have, in an experimental way, given satisfactory results. It is probable also that sulfur will prove a suitable remedy for many fungous pests.

The entire subject of soil sterilization by means of chemicals is new, but the results already obtained are full of promise. The chemicals that would prove serviceable for this purpose should preferably remain in the soil for a short time only. Materials like formaldehyde or carbon bisulfide readily escape from the soil as gases. Materials like sulfur, used for controlling the potato scab, do not escape from the soil, but the effect produced by them can be neutralized by the use of lime. From what has been said above, it is, therefore, evident that so-called sick soils may be restored to their full productivity by the use of either heat or chemicals. At present this is practicable only on a small scale, as in the case of garden or greenhouse soils; or on a field scale, as in the case of the treatment for potato scab. Recent investigations have given us reasonable assurance that the methods of treatment will be improved and the cost of the chemicals themselves reduced to a point where soil sickness will be dealt with chemically on a field scale.—J. G. Lipman.

The Beginning of "The King of Crops"

European farmer seventy-five or one hundred years ago. The same experience has come to the farmers in the United States. Indeed, clover sickness or clover failure has been responsible for much of the depletion in the soil fertility of the older sections of the United States.

In dealing with the subject of soil sickness, or more properly speaking, crop sickness, two methods naturally suggest themselves as offering some measure of relief. It is well known that plants vary in their ability to resist disease. Some varieties are more resistant than others. Thus we have types of flax that are fairly resistant to flax wilt or cow peas resistant to the disease known as cowpea wilt; of potatoes resistant to attacks by the potato scab fungus, or varieties of clover relatively resistant to one of the several fungous diseases which interfere with the normal growth of the clover plants. The resistance to any given disease may be still further increased by selection and breeding. Hence, the plant pathologists and plant breeders are much interested in the subject of disease resistance and the methods for increasing such resistance. The work already accomplished in this field is very encouraging. One need only mention, in passing, the success that has attended the efforts of Professor Bain of the University of Tennessee in developing resistant types of clover or the efforts of Dr. Bolley in Dakota in developing resistant types of flax. The coming decade or two will see much helpful development in this field of inves-

OUR JOB is to serve our readers. Whenever you are puzzled, write to us and we will help you if we can.
—The Editors

Those of you are mistaken who may think that there can be an enduring and effective association of the nations for the maintenance of peace so long as those nations are armed to the teeth.
—Maj. Gen. Tasker H. Bliss

Work For Churches

THE WEEKLY Good Word printed at the head of this column is in line with a letter which Major General Tasker H. Bliss wrote to a clergyman in which he said that the "bloodshed of the next war would be upon the heads of church people, because it is possible for the members of religious bodies in this country to force Congress and the administration to call an international council for the purpose of general disarmament. At the present time arrangements are being made by the Allied Church Council to hold a big meeting in Chicago for this purpose. The women's organizations of the nation are planning to present a united demand for universal disarmament. All farmers' organizations are on record in opposition. The whole question is being studied as never before, because, with the immense national debts of the world upon them, people see the folly of the extravagant expenditure which is being planned by the militarists of all nations. No more certain method of engendering the necessary spirit to produce another war can be devised than for the strong nations to enter a competitive armament-building race.

Fleecing The Public

PEOPLE who are dependent upon anthracite coal for their fuel are becoming alarmed over present conditions and the prospects for next winter. The mines are almost idle and 200,000 miners are out of work. In spite of these conditions the mine owners are maintaining higher-than-war-time prices. Instead of lowering prices so as to induce buying as have almost all other producers, the owners of hard coal propose to play the hold-up game still longer with the idea that the approach to cold weather will scare the public so that they will stand and deliver. It is just such high-handed action on the part of monopolies that reluctantly drives the public into demanding government ownership or government control of business. Fuel is one of the essentials of life and if the owners of coal refuse to operate and sell at a price that permits the public to live, the public has a remedy in their government which it will use when it is driven to desperation. Already there is talk in Congress of taking a hand in the production and sale of anthracite. The mine owners would do well not to invite such extreme action, for they would undoubtedly find that their stubbornness was short-sighted. If men really want "less government in business" let them deal fairly with the public.

Sticking to It

"STOCK feeding is not a game for the gambler. The only one who can hope to make money out of it is the person who sticks to it, year after year." Many times that thought was expressed by various speakers at the recent meeting of the Pennsylvania cattle feeders at the Pennsylvania State College. Figures were given to show that while there were years of depression in which cattle were fed at a loss, on the whole the business had been profitable. The men who had been feeding for several years "came out in the end with money ahead but those who "plunged" in years which they thought were going to be prosperous usually lost money.

The lesson which the experienced cattle feeders learned is one which applies very well to almost any line of endeavor and particularly to agricultural work. No great business ever had smooth sailing all the time. The men who are successful now are the ones who hung on during the lean years, not the ones who gave up the first time the tide turned against them.

Build a Silo

PENNSYLVANIA has over 202,000 farms. The latest available figures show there are 43,657 silos in the state, or only one for every five farms. A map prepared in this office showing the distribution shows that the vast majority are located in the counties of the Northeast, the Southeast and the Northwest. As might be expected these are the sections in which dairying is conducted most extensively. It is also worth noting that the sections in which silos abound are the most prosperous agriculturally. Bradford County leads the list with 3,203 silos; 55 per cent of the farms are equipped with them. Tioga County has 2,833 on 65 per cent of the farms. The percentages in different counties vary down to 3 per cent in Snyder, 4 per cent in Green, 5 per cent in Fulton, etc. The point we wish to emphasize is that there are many good agricultural counties in the state which are not sufficiently equipped with silos for most profitable stock raising. In some places the value of ensilage for ruminant animals other than milk cows is not fully realized. The cattle feeding experiments at State College show that silage is absolutely essential to most economical feeding. The experiments at Purdue University showed that silage-fed cattle produced beef at a saving of \$4 per hundredweight over those not fed silage.

A general farm on which stock is kept is not fully equipped if it does not have one or more silos. The progress of time makes it increasingly necessary for farmers to adopt such measures and equipment as will enable them to turn out their products at the least possible cost. This includes everything that will save labor and conserve crops. Among these things the silo stands pre-eminent.

The Dependable Farmer

WHEN the war broke out and it was seen that this country would be involved, the wisecracks at once began to tremble in the fear that the farmers would not be able to uphold their end of the job. They were firm in the belief that farmers as a class were woefully inefficient; they had always heard it said that such was the case. Farmers buckled down to it and proved again the truth of the old saying that all men are liars. The war ended and found farmers in possession of bumper crops of every kind—crops which had been produced at extreme cost. What happened to the prices was similar to what occurs when you stick a pin into a toy balloon. Farmers were left flat with war-time production costs to pay. Again, dire results were prophesied. Farmers could not, or would not, go on and starvation faced the nation. Again, the false prophets had to eat their words. Patiently and with grim determination farmers hitched up their belts a notch and went to work to produce another crop. They simply reduced their expenditures to meet their incomes and are fulfilling the Divine promise to the race that "Seedtime and harvest shall not fail." Reports indicate about the usual acreage and a normal condition and, whether in full justice or not, bread will continue to be furnished.

All this should convince the critics and doubting Thomases that agriculture is not only the

most essential, but is also the most efficient, the most dependable and the most adaptable industry in the world. Not only is the farmer maintaining normal production at a time when others are afraid and idle, but he has choked back his anger at unfair treatment and begins the payment of his debts. His money and credit is the balance wheel which is carrying the motion of the business machinery past the dead-center, thus preventing a complete stagnation. When these facts once filter into the minds of Congressmen and are acknowledged by the consuming public there should be no difficulty in having such legislation passed as will make the life of the farmer easier and his business more stable.

Our Washington Letter

The emergency tariff bill passed the Senate practically as it was reported from the Finance Committee, by a vote of 63 to 23. Several Southern Senators supported the measure. Amendment after amendment asking for protection on about everything from eggs to airplanes, was proposed and promptly voted down. An especially powerful effort was made to have hides and sheep pelts included in a tariff schedule and farming implements and fertilizers left on the free list, but without avail. Senator Penrose, who had charge of the bill, told the backers of the various amendments "these matters may be corrected at the day of judgment but cannot be corrected in the Senate at this time."

Whether this emergency tariff will benefit the farmers is problematical. It continues in force only six months. During that time it may tend to strengthen the price of wool and dairy products. Other farm products, such as potatoes and grain, will not be on the market in large quantities until the six months expire.

With a desire to increase the farmer influence on the Federal Reserve Board, Senator Arthur Capper, of Kansas has proposed a bill to enlarge the membership of that body to nine by adding as members the secretaries of agriculture and commerce. House and Senate conferees on the immigration bill, which limits the number of aliens who can enter this country during the next year to three per cent of the foreigners from any particular country already registered here, have agreed to the measure with practically the same restrictions and requirements as the Dillingham bill which was vetoed by former President Wilson.

Brigadier General Charles E. Sawyer, physician to President Harding, in Washington, declared that the establishment of the greatest public health organization that graces the earth, was the aim of the administration in instituting a department of public welfare.

The Tinchin anti-grain gambling bill has been under discussion in Congress for several days, with many substantial arguments presented for its enactment. This bill imposes a tax of 20 cents a bushel on each option for a contract of purchase or sale, such as "privileges," "bids," "offers," "puts and calls," "indemnities" or "ups and downs." It also levies a tax of 20 cents a bushel on each contract of sale for future delivery, except where seller is owner or grower of actual grain covered or either party owner or renter of land on which the same is to be grown, or an association of such owners or growers.

Speaking for his bill Congressman Tinchin said that during the war the trading in futures in grain was prohibited by law, and the market, while there were changes in the price, was what might be called a stable one. The very day that the grain exchanges began to operate what they called the future market and began to gamble in grain that day the fluctuations were manifest, and from that time on until today there probably never in the history of our country was a time when there was the difference between the price of the farmers' product and the price of the consumers' product. There never was a time when there was more vicious fluctuations in the market.

Mr. Tinchin did not claim that his bill would absolutely stop grain speculation, but he did contend that it would stop pure, unadulterated gambling in grain, which in every instance is against the producer and against the consumer, and to the profit of the gambler between.

Indications are plentiful that Congress will not be easily convinced that freight rates ought not to come down for the good of the country. A movement in Congress toward a reduction of freight rates is gathering considerable force. Senator Arthur Capper of Kansas is laying before the Senate a large amount of material showing the necessity for lower rates. The Texas state director of markets is quoted as saying that up to the present time 3000 carloads of perishable vegetables have been lost in Texas because it did not pay to ship them. From the Oklahoma state board of agriculture comes the information that "virtually all our perishable products will rot in the field." Michigan iron mines are threatened with closing down because of the high rates on ore. Six months ago, Senator Capper says, there was a deficiency of half a million freight cars in this country. At the close of April this year there was half a million surplus cars. He contends that all of these unfavorable conditions react upon general business.

HARRISBURG LETTER

More Money Than Ever.—Unless all indications fall the revenue of the State of Pennsylvania for the two-year period commencing June 1 will run higher than ever before and it is now estimated the Governor will be safe in approving appropriations for the record breaking figure of \$118,000,000 to \$120,000,000. Two years ago the Governor approved for something like \$105,000,000 and it is an interesting commentary upon the fact that in this period of readjustment the government of the greatest industrial state is adding a dozen millions to its biennial expenditures and to the taxation sources in half a dozen ways. Not only has there been no diminishing of the financial assistance voted to hospitals and homes not under State control but thus far there has been an effort to increase the number of governmental employees rather than to reduce. The Governor has announced a ten to fifteen per cent reduction over what the Legislature voted, but as the aggregate is the enormous sum of \$136,750,000 that is not so hard to do, especially as the Senate added a dozen millions to what the House had voted. The fact remains that the appropriations will be greater than ever and the income likewise, which will probably develop a policy for the next legislative election.

New Dog License Law.—The new dog license act takes effect on January 15 next so that this year the act of 1917 will be enforced. Already steps are being taken to bring many dogs against people who have not licensed their dogs. The new act will raise more money than people think. Vigorous enforcement will probably result in half a million dollars and less than \$200,000 will go for reimbursement of owners of cattle or poultry and the cost of supplies. The dog owners will also pay ten cents to each county treasurer so that quite a handsome sum will go to the state for various purposes which will have nothing whatsoever to do with dogs or sheep. Incidentally about \$300,000 which used to go to counties will not reach them any longer.

No Cows on Olee.—Under provisions of a new law it will be illegal to print pictures of cows or use names of breeds of dairy cattle on packages of oleomargarine. Hereafter such products must not have any indication that they are other than what they are.

Many Fires.—While there were over 1250 forest fires this spring it is very much to the credit of the state's new fire fighting system that only a few of them got over 1,000 acres in extent. The new system saved the state many thousands of dollars.

Stiffer Cattle Feed Law.—The Governor has approved the Haines bill establishing new definitions for cattle feeds and forbidding use of such materials as hulls, by products of oat meal mills, etc., which have been found in packages lately. The most important result of these actions is that the state can sue and not have to wait every time upon a court trial.

Farmers Can Protect.—Under the terms of the new game code amendments farmers may kill if they see destroying trees, poultry, bee hives, stock or crops not only deer but elk, bear, rabbits, raccoons and black-birds and may follow up such game, but must be in a position to prove material damage and report any kills under such circumstances within forty-eight hours and if one fears bears are bent on damage they may be killed within half a mile of any residence.

NEW YORK LETTER

Farm Paper Sold.—The American Agriculturist has been sold by the Orange Judd Company to E. D. Dewitt, former business manager of the New York Herald. The paper was founded in 1842, and later absorbed the Genesee Farmer which was established in 1831. It was acquired by Orange Judd in 1856.

Two Education Bills Signed.—Governor Miller has signed the Lusk "anti-sedition" bill requiring all public school teachers to subscribe to a loyalty test and another of similar nature making sure that all pri-

vate schools are loyal to our government.

County Fairs.—Eighty town and county fairs of the state paid out premiums last year amounting to \$351,223, and will receive \$250,000 this year towards their support. Twenty-two get the limit of \$4000 aid each, and the rest get in proportion to their premiums.

Health Fair.—For a month two demonstration cars furnished by the New York Central Railroad and equipped by the Cornell department of Home Economics, assisted by the Child Health Organization is touring the New York Central Railroad lines in this state. Thousands of school children are seeing the Health Fair and learning that milk and vegetables are essential to health.

Pastures Threatened.—In Oswego County a European weed, known as leary spurge has become serious as a pest in pastures, meadows and crops. The county farm bureau is putting on ten experiments in eradication of the weed. The plant has been known there some years. It is a perennial and poisonous. Federal agents are inquiring if it has been seen elsewhere. It is 2 feet tall, with a strong, milky central stalk branching at the top with leaves, one to two inches long.

Preparing for National Meeting.—New York Holstein breeders are busy preparing for the big meeting and sale in Syracuse the week of May 31. Tompkins county breeders are fitting five of the forty head this state is allowed to exhibit. Tompkins County boys and girls this week select their calves for junior project work. One of the entrants, Franklin Scudder, won first premium, a calf at the State Fair, which later reacted in a tuberculin test. To replace it he was given two purebred calves, male and female, unrelated, and he is to compete again this year. The State Bankers' Association is giving the juniors great assistance in livestock breeding.

NEW JERSEY NEWS

Big Wheat Crop.—It has been estimated by the United States Department of Agriculture working in cooperation with the New Jersey Department of Agriculture, that this state will yield thru its farms about 2,027,000 bushels of wheat this year, if present weather conditions continue. This amount is an increase of 507,000 over that of 1920, last year's total being 1,520,000 bushels. The average production for the last ten years in New Jersey was 1,557,000 bushels.

State Police Head.—It is expected that Governor Edwards will soon designate the date for the special session of the State Senate for confirmation of an appointment to the position of superintendent of the proposed New Jersey State Constabulary, which will be devoted largely to ferreting out criminals and running them down in the rural sections of the state. There is a general impression that the session will be held some time next month. The constabulary will be in operation on and after July 1, when the legislative appropriation for its work will become effective.

Senator Will Speak.—State Senator William N. Runyon, of Union, will be the principal speaker at the annual field day of the Morris County Board of Agriculture. This event, attended by hundreds of farmers from many sections of New Jersey, will be conducted this year on June 7. The main events of the day are to be held at Brooklawn Farm at Littleton. Preceding the annual meeting of the members of the board and the field day social and other affairs, there will be a tour of several of the large dairy and other farms in Morris County.

Farm Work Advanced.—Spring plowing and sowing in New Jersey has been advanced to a further extent this year than at this period in previous years, according to a crop report issued by the State Department of Agriculture, which added that, of the plowing 75 per cent or more has been completed, while more than 64 per cent of the spring sowing and planting has been taken care of.

Foods in Storage.—Reports show there was an increase in the number of cases of broiler, eggs, pounds of broken eggs, pounds of milk and milk products, edible fats, etc., in cold storage for the month of March.

Champion

Dependable Spark Plugs

THE users of Champion Spark Plugs have really made the reputation of "Champions" for dependability.

They realize that "Champions" are continually giving the highest spark plug value, —the greatest service, —for the least amount of money.

Champion indestructible "3450" insulators, and patented copper asbestos gasket construction, guarantee absolute spark plug dependability.

Over 32,000,000 were sold this past year.

Green Mountain SILOS

STABILITY COUNTS

Your Green Mountain Silo, with the popular hip roof, will never need an apology. It is built to stand up permanently—just as any other farm building is expected to do. Every screw and joint is made to fit tight—both for permanence and silage protection. Every silo is treated in creosote preservative. Hoops are of extra heavy steel with rolled (not cut) threads. They cost us more but they stand unusual strains. Doors fit like a snail—always tight. Wooden ladder runs; no iron to frost the fingers. Green Mountain Anchorage system holds silo absolutely firm and upright. A beautiful silo—with nut-brown side walls and bright red cedar roof. Write today for detailed circulars. Special inducements for early orders.

PLEASE say: "I saw your adv. in Pennsylvania Farmer."

Dairymen's League Milk Prices

DUE to the innovation of preparations for pooling all sales of milk in New York the May milk price was not announced as early as usual. Many details had to be worked out before dairymen could know what to expect.

The price has been set on three of the four classes into which the League divides all milk. But even so dairymen will not know until the end of the month what their actual receipts will be as the pool levels all prices so each shares alike in the end, with a few necessary differentials of course.

Under the price quotations the usual differentials will prevail—the basic foundation being 3% per cent milk as before.

Something of a precedent has been set in many ways this month. The price at this beginning of the surplus season has advanced on fluid milk from \$2.10 to \$2.30 per cwt. of three per cent milk—due to the pool. Without the pool the early spring and the unequalled market conditions would doubtless have borne the price of fluid milk down to \$1.60 to \$1.80.

the entire level of milk made by these conditions will have its effect on the general price of May milk. Those dairymen who have no other outlet for milk except butter and cheese ought to regard the pool as a fairy godmother and so long as their brothers who produce fluid milk share their returns with them they ought to feel pretty well treated, and ready to be patient with any delays or possible errors in administration while this enormous industry is adjusting itself under wholly new conditions.

Most of the big fluid milk dealers have signed up for May milk at \$2.30 and manufacturers too at the price they are to pay. Supporters of the new plan believe a more steady market will be assured in future as the plan is established.

Better distribution methods and advertising to increase consumption of milk are some of the things expected as the plan grows in detail. Milk is largely under consumed at present from a health standpoint. A few cents from each member of the co-operative organization used regu-

These are some of the Milking Shorthorn Breeders of Bradford County, Pa. There are not many of them but by working together they have made their presence felt. A very successful annual sale is one of the events staged by this live-wire organization

Now dealers are not forced to take all the milk at the top price or fluid milk prices, and so soon they are seeing the advantage in this and are even co-operating to make the pool a success, after the long and bitter fight against it. There is apparently nothing in the advance in wholesale price to increase retail prices, due to removal of the surplus.

The price on Class 2 milk for May is \$2.10. This includes milk made into several products, as plain condensed milk, ice cream and soft cheeses.

Class 3 milk brings \$1.80. This is all milk made into sweetened condensed and powdered milk and into such cheese as Swiss, Limburger, etc.

Class 4 milk prices will not be known until later, and will be such as the market actually returns for milk made into American cheese and into butter.

The outlook on this is not good. In northern counties the price of cheese dropped to 14 cents this week, the lowest in many years. The state stands second in cheese production. Freight rates and the unusual competition of imported butter makes that outlook bad, and so the drag on

larly to advertise milk as a food would do much to correct this, especially as all health organizations are anxious to co-operate in this work. The development of regional manufacturing units will be expensive and necessarily slow but will greatly aid to the efficiency of the new plan.

As one clear thinker puts it in speaking of the pooling system, and of big industries: "There are three main factors involved in the success or failure, principles, methods and men. On only two of these can it really fail. If the principles are wrong failure is a foregone conclusion. If the men in charge are incompetent it can fail. Methods can be changed, and often are." He believes that the principles of pooling are already proven to be right; that problems and vexations in connection with working out the new scheme will arise to tax the patience of members. But the thing to do is to keep the eyes on the development of plants to take care of the surplus products and to remember if methods prove wrong that they can and will be changed. The producers must be tolerant and not demand an overturn of the whole system the minute some-

The clever door-faster is also the famous safety ladder

UNADILLA SILOS

The door frame of the Unadilla Silo gives a continuous opening through which you shove the silage instead of picking it overhead. This saves work. The door fasteners form a convenient, permanent ladder of wide, low "safety" rungs directly under the opening. This gives safety and convenience. Doors open automatically by raising these fasteners.

The hoops are all easily adjustable from the ladder. This gives long life to the silo and perfect protection for the silage.

Two Unadillas are purchased in the East for every one silo of any other kind. Get a Unadilla, more money, make your work easy and safe. Write for our catalog giving full particulars. Also for early-order discount and agency offers.

OFFICIAL TESTING IN PENNA.

During March of this year there were 739 cows of all breeds on official yearly test on 113 farms in Pennsylvania. There were 176 seven-day official tests recorded in the Advanced Registry office during the month, according to a summary prepared by Paul S. Williams, in charge of advanced registry testing in the state. There were on yearly test during the month 237 Ayrshire cows, 198 Guernseys, 146 Jerseys, 151 Holsteins and 7 Shorthorns. Forty-eight farms reported seven-day official records for Holstein cows during March. There were 44 Holstein cows that made between 20 and 25 pounds of butter in seven days and 15 cows that made from 25 to 30 pounds. Twenty-eight official test supervisors were in charge of the work throughout the state during the month.

There was recently organized in Chester County an association of breeders doing advanced registry testing. The object of the organization is to reduce the cost of doing testing and it is believed that by forming organizations of this kind the cost to the breeders can be very materially cut down. Other men who are interested in associations of this kind should communicate with Paul S. Williams, Department of Dairy Husbandry, State College, Pa.

REDUCED FARES TO HOLSTEIN SALE

Reduced fares to the biggest Holstein sale of the year have been granted by the railroads in certain territories. Breeders coming to the second National Co-operative Sale of the Holstein Friesian Association of America, to be held from May 31st to June 4th, in Syracuse, N. Y., in connection with the annual meeting of the association, will effect a 25 per cent saving.

States included in the reduced fare area are Michigan, Indiana, Ohio, Pennsylvania, West Virginia, Virginia, Maryland, Delaware, New Jersey, New York, and the portion of Illinois bounded on the west by a line drawn from Chicago to St. Louis. Breeders coming from beyond these states can secure reduced fares while within the area.

When buying tickets to Syracuse, breeders within the states listed should ask for reduced fare certificates. These will be stamped at the sale and count for one-half the cost of the return ticket. Certificates will not be granted on fares into Syracuse costing less than 67 cents.

Members from beyond the reduced fare section can secure a certificate when entering the territory and the reduction for that part of the trip. Officials of stations not having certificates will furnish information as to where they can be secured. It will necessitate a change in both cases, but will mean a saving.

CAMPAIGNS INCREASE MILK USE

Following a milk-utilization campaign in Spokane, Wash., a survey was made which disclosed the fact that as a result of the campaign 6,000 people had increased their consumption of milk. During the campaign it was found that 2800 school children in Spokane drank no milk, but that during the campaign 2100 started to drink it daily.

Why the De Laval Milker Increases production

The De Laval Milker is based on two fundamental principles that govern the milking of a cow for greatest production:

(1) 85% of a cow's milk is made during milking time.

(2) Unless milking is pleasing to a cow, the greatest amount of milk will not be made.

The organs of a cow which make milk are so sensitive, and the milk is made in such a short time, that the way milking is done greatly influences the production.

The De Laval Milker operates in a manner most pleasing to a cow and therefore the organs which make milk are stimulated to greatest production. Its action is gentle, uniform, cannot be changed, and anyone can operate it. The fact that it usually increases production over hand milking, is the best evidence that it pleases the cow.

The extra milk your cows will give and the saving in time will soon pay for a De Laval Milker. It is a better way of milking. Write for complete information.

TIDEWATER PLANT COMPANY, Franklin, Va.

HORTICULTURE

A Successful Orchard

By J. P. STEWART

WE recently had the refreshing experience of visiting an orchard in which the owners were not kicking either about their experience of last season or their prospects for the present season. They have about one hundred sixty acres in tree fruits of various kinds, only about half of which are in bearing, and a considerable part of the bearing portion is only getting started.

The ownership of the orchard is a family affair, consisting of a father, son and son-in-law. It is, however, incorporated, as a company, has a fairly definite division of duties assigned to each of the owners, and pays each a regular salary. In spite of the relatively large development expense which naturally was attached to their operations last year, at the close of the season they found themselves in possession of a net profit of more than \$15,000 after paying all operating costs, liberal salaries, taxes, etc.

This is of course not a big profit for the acreage involved and especially not if it had all been in bearing, but under all the circumstances, we suspect that there are many growers in the country with even larger acreages, who would have been very willing to compromise on the figure named as their share of the net returns for the season of 1920.

As to prospects for 1921, this orchard is fortunate this year in being located well to the northward—close to the Great Lakes in fact—so it has been retarded in blossoming sufficiently to have practically escaped damage from the unprecedented freezes of the present spring. Peaches and sweet cherries, in particular, are about the only fruits that have been hit much, and present indications point to at least a half a crop of the former. Incidentally, the owners are not going to plant any more peaches, according to present intentions, as they are finding them less profitable than apples and some of the plums—particularly the French damson, which seems to do especially well on their place and market.

Why They Have Succeeded

The chief reasons for their success last year, when many others were having rather rough sledding, were apparently in the quality of their product and the market connections they had built up. When the general market was offering less than \$6 a barrel for Jonathans at principal centers less a good stiff freight charge, these men were able to haul their large-sized Jonathans to a good, flourishing railroad center for distribution on the trains, at three dollars a bushel with package returned. Their net returns on this fruit, therefore, were about as much per bushel as most growers were getting per barrel on the same variety, and were even more than the gross returns per barrel from many other varieties.

Incidentally, the Jonathan apple has been doing most famously on this fruit farm. Four acres of 17-year-old Jonathans last year gave a net profit of more than one thou-

sand dollars per acre, when the general conditions were about as bad as anyone cares to see. This, however, was largely accomplished, as already stated, by special marketing arrangements, which returned to the producer a much larger share of the consumer's dollar than has been the case generally.

These men have also been rather liberal in the use of fertilization in their orchards, having used large quantities of nitrate of soda for several years, which has undoubtedly been a large factor in maintaining their steady and constantly increasing yields. They have also followed the mulch system with alfalfa and other legumes to a large extent, in their apples especially, but they do not hesitate to go in with the plow or disc whenever considered desirable or necessary.

HANDLING THE STRAWBERRY CROP

It is one operation to produce a crop of strawberries, then it is another one to harvest it after it reaches maturity. We have tried several methods of handling the berries after being picked in the standard quart boxes. One of which was to let the pickers, after filling the boxes place them, as much as possible, in the shade along the row until perhaps six or eight boxes were filled, then have them gathered up and taken to the packing shed. This not only resulted in a loss of several boxes during the season, both from being careless handling the boxes, causing the berries to be spilled and having boxes upset or stepped on but required considerable time for the picker to be away from the field.

Then we tried letting the pickers stay right in the field and having an extra helper to go from row to row gathering the boxes that each picker filled and at the same time keeping strict account of the number of boxes each one deserved to receive credit for. But for various reasons, such as the expense of the extra helper, the time lost in conversation to each picker as the berries were gathered, etc., this did not, we considered, exactly turn out the way we hoped it might.

The method that we like best is to furnish each picker with a small tray. This tray is very easily made, during the winter perhaps. It can be made quickly and reasonably. We find there is little saved in using second hand lumber of ununiform sizes and description. In preference to such, we use shingle lathe, and mason lathe. The lathes are cut in two pieces 20 and 12 inches long. Two pieces 20 inches long form the sides while two more pieces 12 inches long furnish the ends. This gives an inside measurement of 18x12 inches. Permitting six boxes to be placed in the tray at one time. For the bottom we use mason lathe, which requires two, out of each we can get two pieces 20 inches long, which leaves a piece 8 inches long unused. This we cut in half and use for legs, placing one on each corner. These are put on flush with the top

INCREASE Your Yield

Give your crops a top or side dressing of our

NITRATE of SODA

Growing crops absorb it quickly, and it becomes immediately available.

Best used as a side or top dresser—400 lbs. to the acre for cabbages.

We can also supply other Fertilizer materials and Insecticides—and quality Mixtures—proportioned so as to give uniform growth from seedling to maturity—even under most adverse weather conditions.

Full Line of High Grade Seeds at Lowest Prices

of the shingle lathe, which has a width of two inches, insuring us of a substantial place to nail it to. This, of course, leaves a leg extending two inches below the bottom. We make a handle out of a barrel hoop, using one half of a hoop for each trap fastening it at the ends or sides. One can easily see that the cost of the labor and material in constructing one of these trays is at the minimum, and yet returning by their value the maximum amount of efficiency.

As the pickers fill the boxes which by means of the trays can quickly and safely be moved from place to place, they take them to the packing shed and place them on a table. A tray filled with empty boxes is given them and number picked recorded, allowing them to return to the patch immediately.

POULTRY

Management of Chicks After Weaning

When the chicks have reached the age of weaning they have passed thru practically all the dangers of chickhood, and the poultryman can safely count his future flock if only he will continue to give the young birds a reasonable amount of care and attention until they are ready for market or the laying houses. But neglect may undo all the good work of the past weeks. In nearly every neighborhood it is possible to observe instances where large flocks of chicks are hatched in the spring but only a comparatively small number of which ever reach marketable age, simply because the chicks are given no attention after they are weaned and they are, therefore, lost, a few at a time all summer long, until the broods are sadly depleted by fall. Any one agency may claim only a few chicks in a flock, but the combined ones from all causes will frequently be great.

A common cause of loss is to permit various broods, after they have been weaned by the hens or removed from the brooder houses, to desert their coops and roost on fences or in low trees about the poultry yard. It is then impossible to control the young birds during spells of rainy weather, exposure to which is sure to carry off some of the weaker chicks. It is equally bad, however, in those localities where night prowling animals, such as opossums, skunks, minks and weasels, are known to exist, to allow the chicks to continue to use their old coops without their being fastened in each night. The chicks are then easily attacked by the marauding animals, an entire brood sometimes being destroyed in a single night. In such cases the chicks would really be safer from the attacks of the night marauders if they were perched in a tree or on top of a fence.

Chicks outgrow their original coops, of course, and even though a brood of half-grown birds could crowd into its old home, the coop could not safely be closed up tight on a hot night. The only practical way of solving the problem of giving the weaned chicks ample room and at the same time complete protection at night from carnivorous animals is to install them in roomy colony houses. It is unfortunate that colony houses are not more generally employed on the farms of the country. Their use would be the means of saving the lives of many young birds on every farm, the value of which would pay for the construction of the colony houses in just a few years. It is little trouble to

transfer chicks, as soon as they are weaned, to colony houses. By keeping the young birds confined for a day or two, and feeding them regularly in front of their new home after they have been given liberty, they will quickly learn to go in each night. It then requires only a few minutes for the caretaker to fasten all of the colony houses securely, and he thereby always has the chicks under complete control and protection from most dangers at night.

Rats, when hungry, will sometimes seize chicks in the daytime. Where rats or any of the other marauding animals are known to exist, no time should be lost in capturing them, or failing at that, in destroying all possible harbors near the poultry quarters. It is generally possible to rout rats and other small predatory animals by digging after them, for when they know they are being pursued they usually seek new quarters. Hawks and crows are great destroyers of young stock, but seldom attack half-matured birds. They are, as a rule, easily scared away.

The summer range for chicks must provide the young birds with ample protection from the hot sun. Shade is really essential to the health of the growing chicks during the hot months. It keeps them comfortable and growing continuously. It prevents deaths by sunstrokes. If it is not possible for the chicks to range in a grove or orchard, it is necessary to construct wooden or canvas shelters of some kind under which the chicks can seek refuge when the heat becomes oppressive. Some poultry raisers whose yards are devoid of trees plant a patch of corn or sunflowers for the especial purpose of furnishing shade for the chicks and old fowls in hot weather.

When chicks range widely, as they do on most farms, they should also be provided with some protection, in addition to that afforded by the coops or colony houses, from the sudden heavy storms that occur thruout the summer. When storms make their appearance the chicks rarely go into their houses because they are dark, or because the young birds do not reach them in time; as a usual thing they do not make for shelter until the storm is on. Thus many are drowned, especially if they are a pound or less in size. Many such losses can be prevented by constructing large flat shelters of old lumber covered with tar paper to make them waterproof. Set each shelter about a foot off the ground on posts or heavy stakes. Nail it fast to its supports so there will be no danger of the wind moving it. Such shelters should be placed in far corners of the range so the chicks can make for them when a storm comes up, if they haven't time to reach their houses.—W. F. P.

SOME WORK TO RAISE CHICKENS

All things considered, from beginning to ending, hatching and catching and feeding and tending, chasing and killing and scalding and pickin' There's a great deal of work about raising a chicken. Watching the hen while she's doing the hatching. Watching her, too, while she's eating and scratching. Guarding 'gainst hawks and 'possums and rats. Driving off crows and dogs and cats. Ready all day to give something a lickin'.

There's a great deal of work about raising a chicken.
—Lola Sullivan.

HOMAKER

"HOME-MAKER" PIPELESS FURNACE

Balmy Warmth in Every Room—and No Dust or Dirt

YOU need no longer be satisfied with comfortable heat in only a few rooms in your home. HOMAKER, the better pipeless furnace, is guaranteed to give every room in the house, upstairs and down, the balmy warmth of a summer morning. No matter whether the temperature outdoors calls for much heat or little, HOMAKER provides perfect heating control. It maintains an even healthful temperature with an ease of attention and a saving in fuel that are truly remarkable.

And all this with never a speck of dust in the furnace room or in the house above, for HOMAKER has conquered the health-menacing nuisance of dust and dirt. It is absolutely dustless—a triumph of the furnace builder's art.

This is Why HOMAKER is the BETTER Pipeless Furnace

You shake and dump HOMAKER from an easy upright position with all its doors closed tight. No trace of ash dust can escape. Edgedump grate gets rid of ashes and saves live coals. Outer casing and register both oversize; heat-radiating castings are centered; abrupt air passage angles eliminated. This combination effects a freer circulation of the warm air. HOMAKER need never be forced. Quadruple casing, inner one with a heavy insulation of air-cell asbestos between the two sheets of steel. All the heat conserved for upstairs; none wasted in the cellar. Cast smoke collar runs clear through the casing. No gas can leak out. Full width ash door. No hard-to-clean corners in ash pit.

Write today for free book "The Story of HOMAKER". It explains in detail HOMAKER'S many vitally important improvements.

Of Interest to Farm Women and Girls

When Strawberries Ripen

RIPE sweet strawberries certainly do make sugar and cream taste good. And ordinarily they are good for most people. Being only mildly acid when prime, and containing much the same kind of acid as apples, pears, etc., they are usually very healthful. We pity the unfortunate who cannot eat them without getting a disagreeable prickly rash. Just what causes this in some individuals is not definitely known, except that it is due to some defect in the individual's metabolism (assimilation of food). We have known cases where strawberries ceased to produce this rash and discomfort when the general health was improved by better nutrition obtained by better balance of meals and better living conditions, such as plenty of fresh air at night and other times, proper elimination of body waste each day, etc. It is worth taking some trouble to put oneself into

A Tempting Dish of Strawberries and a Plate of Hot Gems

proper physical condition to enjoy the luscious strawberries while they are in season.

Serving the Fresh Berries

A few years ago I spent the strawberry season in Upper Ontario, in a section where everybody, even in the hotels, had the habit of serving the berries crushed and sugared. Everywhere we had them brought to us that way—it did seem such a shame so to mutilate such great fine berries as they grew up there. Fortunately at the farmhouse where I stayed for a time I persuaded them to let me have mine whole, and let me put the sugar over them just as I was about to eat them. I was quite a privileged guest after I proved to the old farmer who ran the strawberry bed that I was really a farm girl, and did actually know how to treat the strawberry plants. I was the only one of the guests whom he would allow to pick the berries, and he came to appreciate my help very much in the height of the season. His was the only strawberry patch for miles up and down the lake, and the people from the hotels used to canoe or sail or motorboat to Gleniffer Braes Farm (of the strawberry patch) for the fresh berries. The patch was back in a clearing in the "bush," with a high rail fence around it to keep the deer from getting at the berries and other "garden gass." I have picked a good many bushels of strawberries in my life, but never in such quaint surroundings nor with such a feeling of privileged importance. Picking strawberries on your own farm is a much more intense job, and quite a bit hotter than up there in the Muskoka wilds in those days.

this 1 1/2 tablespoons butter (or lard) and mix up with 1/2 cup cream, and roll out 1/4-inch thick. Cut into individual rounds like the shortcake illustrated here with a 4-inch diameter cutter, or you can bake it in a flat sheet, then cut square for individual servings. Butter one layer, then lay on top of it another layer of the dough, and bake in a quick oven until slightly brown. Have ready your strawberries slightly sugared, and some of them crushed

Individual Shortcake Surmounted With Whipped Cream Topped With a Big Strawberry

to make a red juice, put them between the layers of biscuit, pile some sweetened whipped cream on top, as illustrated, and dot with a few nice berries. Serve with sweetened crushed berries. Doesn't that make your mouth water?

Jellied Strawberries

Sugar a quart of even-sized berries, but do not crush them. When some juice has run out, drain it off and set away to cool. Dissolve one package of gelatin in a little cold water, and pour 1 pint of boiling water over it. When cool, but not firm, set, beat the stiff white of an egg into it, and add the strawberry juice. Pour this mixture over the sugared berries, and put into a mold and set in a cold place to stiffen. Cut

up in chunks, and serve cold with cream.

Strawberry Charlotte

Line some deep glass sauce dishes with thin slices of sponge cake, fill the inside with sugared whole berries, cover with sweetened whipped cream or with the sweetened stiffly beaten whites of eggs. Put a big strawberry on top of each dish. If possible set where the charlotte will chill before serving.

Good Strawberry Pie

Bake the shell separate to a nice brown. Put the berries into the shell. To 1/2 cup flour add 1/2 cup sugar, and sift over the berries. The flour will take up much of the juice that usually troubles us in baking strawberry pies. Then when the berries have cooked and thickened sufficiently, spread on an egg white meringue, and set back in the oven to brown. Or instead of the meringue, you may prefer to spread whipped cream over the pie.

Nice Way to Can Strawberries

Wash and hull the berries. Pack them quite closely into cans just taken from scalding hot water. Fill the cans with a hot rather thick sugar syrup, put on the rubbers and screw on tightly the can covers (also just taken out of the scalding water), set the cans in your wash boiler, slowly pour in hot water (slowly so as not to break the cans) until the cans are covered an inch or more, put on the boiler cover, and leave the boiler setting on the kitchen floor until the water cools enough to put your hands in and lift out the cans. Do not attempt to screw the covers down any tighter, because thus you will break the seal that the can cover has made by imbedding itself in the soft hot rubber, and then cooling therein. Thus canned strawberries do not shrink nor muss up as when cooked otherwise. They also retain their fresh flavor better.

This is also a good way for canning cherries to retain the fresh fruit flavor. But I like best first to pour some boiling water on the cherries in the can, and let them stand a few minutes, then pour it off before pouring in the syrup and sealing the cans. Thus treated, the hot water takes out the strong taste and makes a much finer flavor for the canned cherries, we think.—Harriet Mason.

PREPARING DANDELION GREENS

In preparing dandelions for the table it is well to pull the clumps apart to be sure that all the dirt is removed. Dandelions that are in blossom may be used with the blossoms and buds but it is well to remove all of the blossoms that are beginning to get old. Wash in plenty of water always removing the greens from the water thus leaving the dirt in the bottom of the pan. After they have been washed until the water is perfectly clear I put them in a kettle of boiling water to which I have added a teaspoonful of soda. I cook them from one-half hour to an hour according to the age of the plants. No matter how old they are, even in midsummer they will be good if cooked in this way. Turn off the first water and add water in which a slice of pork has been cooked, and cook slowly until tender and well done. A large mess will need more than one teaspoonful of soda.—Clarice Raymond.

DRESSES FOR LADIES

3498.—An Attractive Gown.—The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 3 1/2 yards of 40-inch material for the dress and 2 1/2 yards of 27-inch material for the guimpe and wash materials are attractive for this design. Braid or bands of embroidery would be pleasing for decoration. One could have a pretty dress in this style of serge and satin. The width of the skirt at the foot is about 2 yards. Pattern, 10 cents.

3559.—Dress for Slender Figures.—It is cut in 3 sizes: 16, 18 and 20 years. An 18-year size will require 4 1/2 yards of 44-inch material. The width of the skirt at the lower edge is 2 yards. Duvetyn, satin, taffeta, linen, voile, ratine and etamine would be attractive for this model. The skirt is joined to an underbody. The sleeve may be finished in wrist or elbow length.—Pattern, 10 cents.

PRETTY DRESSES FOR GIRLS

3506.—Guimpe Style Dress for Girl.—The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. An 8-year size will require 1 1/2 yards of 36-inch material for the guimpe, and 2 1/2 yards for the dress. The guimpe may be of silk, crepe, lawn, batiste or voile; the dress of gingham, chambray, percale, poplin, pongee, rayon, serge or plaid suiting. Pattern, 10 cents.

3535.—A Smart Frock for the Junior.—The pattern is cut in three sizes: 12, 14 and 16 years. A 14-year size will require 6 1/2 yards of 27-inch material. Serge, chambray, taffeta, tricotine, foulard, pongee, shantung, crepe de chine, also gingham and other wash fabrics are attractive for this style. Pattern, 10 cents.

Strong soaps and cleaning powders containing alkali injure linoleum and should never be used on it. Do not eat rhubarb leaves as they contain varying amounts of poison. E. M. A.

READERS' OPINIONS

Liberty Bonds and Taxes

I saw an able article in your editorial in the issue of April 23d, in which you speak of the great amount of taxes to be raised in the United States in the future. We all know who will have the entire burden to carry, if there is a sales tax levied. Now it looks to me that if we would have laws made to prevent the paying of all the interest on all issues of Liberty bonds by Congress passing a resolution making them par dollar for dollar or face value and negotiable it would save millions of dollars interest. When I went to school in the little old red school house, I heard them talk of one dollar saved being worth two earned, and I believe the same old principle will apply to us today. When the Liberty Bonds came due as of the several dates of issue they could be retired in amounts so as not to interfere with the circulation of our regular money and not hurt our interests in the least when the country becomes settled and everything is going right.

Of course there will be great opposition from the big banking interests as they want the Liberty Bonds kept at the present value of from \$86.50 to \$97.50 until the people now holding them are compelled to dispose of them for the real necessities of life, being out of work on account of the present depression.

We paid good hard earned money face value for the liberty bonds when we got them and why should we be compelled to sacrifice so many dollars now just when we need them so bad and then have our government come after us to pay interest on same in the way of increased taxes. I think we should write our Representatives and Senators on this question.—J. A. Breth, Clearfield County, Pa.

The Hunting Menace

In our section it is hard to tell which constitutes the greater menace to the farmer, hunters of wild game or of fruit, nuts, etc., but we would consider ourselves fortunate indeed if the latter class would confine their depredations to wild vegetation. Our city vandals think nothing of taking absolutely any fruit they can find. They pick any kind of berries that are accessible from the road, they tear off all tree fruits and destroy the tree in their greediness to fill their big cars as quickly as possible, they have no regard whatever for the ownership of nuts, vegetables, flowers, or anything they find growing anywhere.

If my little daughter wants nuts from our own woods it is never safe to let her go after them alone for a minute—I must leave my work on Saturdays and go with her and, even then, our men hardly consider it safe for us to go during the hunting season and nuts are not ripe at any other time. My own and my neighbor's children greatly enjoy playing in those woods in the summer but every Sunday during the hunting season they are so full of hunters that no one may safely venture into them. We hear their shots before breakfast and they continue all day long.

Yes, organized farmers could do anything to enforce reasonable legislation if they would try. Let us protect ourselves against the armed horde which steals our crops and destroys the security of our homes.—E. M. A.

Now is the Time to install a "Dockash" Steel Range

They are made of Steel (not cast iron) and are built to give lasting service.

Investigate both the practical and economical heating principles of the

"Dockash" Steel Range which is made to cook better than an ordinary range. Being made in both right and left hand

styles with and without reservoir arrangement of your kitchen.

WHEELS—30 x 3½ wheels with Goodyear non-skid tires. ROPEING HOOKS for securing load. HITCH—ball and socket instantaneous. FINISH—black automobile finish with blue paneling. ATTACHMENT for standard makes of cars.

You Can Afford a Farm in Fertile Ontario or Quebec

The wave of high land prices may well turn your attention to the opportunities to be found in these two older Provinces of Canada. Here, close to immense cities—great industrial centers—with all the conveniences to be found in any land anywhere, are farms which may be bought at very reasonable prices. Owners are retiring, independent—in many cases rich. High prices for all farm products, good markets, all the conveniences of old, well-settled districts, beckon you to investigate.

A Wonderland of Opportunity for the Pioneer.

If your means will not permit you to buy an established farm, Ontario and Quebec offer great fertile regions where the pioneer can live out a home for himself and family—where prosperity and independence are to be won by those who will put forth the effort. Every branch of agriculture may be followed in these Provinces; dairying and stock raising are particularly successful.

For illustrated literature, maps, etc., write Department of Immigration, Ottawa, Canada, or

HAY

TALKS WITH THE BOYS

To the Boys:

We have two photographs to live on the page this week. One is a picture of Woodrow Zimmerman, of Millville, New Jersey, who is a reader of the Boys' Page and who is interested in poultry and gardening and the other was sent by Charles Kim, of Indiana Co., Pa. Charles tells about the picture in his letter which is printed below. The boys who write us and ask questions should be sure to give their postoffice address so we can answer them by mail.

THE EDITOR.

LETTERS FROM THE BOYS

Dear Editor—I am a boy 13 years of age and live on a farm of 123 acres. I have three brothers and one sister younger than I am. We have 3 horses, 6 cows, a registered Holstein bull and a Holstein heifer we are raising. We have 6 hogs and 5 little pigs. We have 40 little peeps and 30 old hens. We also have a 6 horse power kerosene engine that we use to grind feed and fill the silo. We just put up a silo last fall and

which is about two-thirds of a mile from my home. We live in the middle of Long Island on a farm of about forty acres. I like to go trapping and fishing but I didn't do much trapping this season because the price of furs was much lower than last season. I caught one skunk a rabbit and a squirrel. I hope this letter will make your page a great success.

Please send me your particulars for collecting subscriptions for the Pennsylvania Farmer.—Peter P. Zakas, Long Island, N. Y.

Dear Editor—I am fourteen years of age and live on a rented farm of 91 acres. I go to Saco to school and am in the seventh grade. I have one brother older than I am. We have thirteen cows, three yearlings, three calves and four horses. I have a pet dog which I call "Sheppie." We also have a horse called "Johnnie" which I ride. We have a gasoline engine and a car. I like to go fishing and there is a pond joined to our farm. Every morning I clean the barn.—Frank Annick, Bradford, Pa.

Dear Editor—I'm on, so let's go! I am eight years of age and live in the country on a small truck farm of six acres. As pets I have chickens, ducks and a dog. I did have a horse, but traded him to daddy for the dog. I call him "Scraper." When we had snow last winter I used to take my sled to school, but as there wasn't much snow, I didn't make much use of a perfectly good sled.

Did you ever go to a country school and did they shoot paper wads when you were a boy? We

Charles Kim's Father and Brothers and Pet Pigs

we think silage is the best feed for cattle. Our barn was struck by lightning last July 30th and we lost all our hay, wheat and rye. We built a new barn, 43x21 but it isn't large enough, so we have started to build a larger one and it takes a lot of hard work.

I do all kinds of work except running the binder and mower and milking cows but my brother can milk and I tend the horses. We have 3 cats and a lamb we are raising on the bottle. These are the pets. We take the Pennsylvania Farmer and think we couldn't get along without it. I like the boys' letters. Inclosed find a picture of my Dad and two youngest brothers, taken two years ago.—Charles J. Kim, Indiana County, Pa.

Woodrow Zimmerman, Age 10

do sometimes, yet only when teacher isn't looking.—Geo. Horrell, Blairsville, Pa.

Below are the names of some more of our friends from whom we have received letters.

Ellsworth Noble, Bradford Co., Pa.
Clair Druck, York Co., Pa.
Joseph Pickering, Mercer County, N. J.
Lloyd Esham, Wicomico Co., Md.
Roy Martin, Lancaster, Pa.
R. Everett Moore, Salem County, New Jersey.
Harold Coles Moore, Salem County, New Jersey.
John A. Rarick, Schuylkill County, Pa.
Melvin Baylor, Lycoming Co., Pa.
Stanley Stewart, Sullivan County, New York.
John J. Golden, Wayne Co., Pa.
Frank B. Barr, Bucks Co., Pa.
Merle Randall, Tioga Co., Pa.
Arthur Marsh, Erie Co., Pa.

Dear Editor—I have never written a letter to be published in the Pennsylvania Farmer, but now I have a chance to write one.

I am 14 years old and am in the Seventh and Eighth grade at school

The Valley of the Giants

By PETER B. KYNE

Chapter III

Synopsis—John Cardigan, a middle-aged man—a giant in frame and mind—was a pioneer settler along the Pacific coast in Humboldt County, California, in 1850. His business was cutting the giant trees into lumber. His young wife died and was buried among the redwoods in "The Valley of the Giants," as he called the spot which he loved and presented as a shrine to his memory. Bryce, Cardigan's only son, was an intimate friend of his father—who planned that he should inherit the great lumber business which he had built up.

WHEN Bryce Cardigan was about fourteen years old there occurred an important event in his life. In a commendable effort to increase his income he had laid out a small vegetable garden in the rear of his father's house, and here on a Saturday morning, while down on his knees weeding carrots, he chanced to look up and discovered a young lady gazing at him thru the picket fence. She was a few years his junior, and a stranger in Sequoia. Ensnared the following conversation: "Hello, little boy."

"Hello yourself! I ain't a little boy."

She ignored the correction. "What are you doing?"

"Weedin' carrots. Can't you see?"

"What for?"

Bryce, highly incensed at having been designated a little boy by this superior damsel, saw his opportunity to silence her. "Cat's fur for kitten breeches," he retorted—without any evidence of originality, we must confess. Whereat she stung him to the heart with a sweet smile and promptly sang for him this ancient ballad of childhood:

"What are little boys made of?
What are little boys made of?
Snakes and snails,
And puppy dog's tails,
And that's what little boys are made of."

Bryce knew the second verse and shriveled inwardly in anticipation of being informed that little girls are made of sugar and spice and everything nice. Realizing that he had begun something which might not terminate with credit to himself, he hung his head and for the space of several minutes gave all his attention to his crop. And presently the visitor spoke again.

"I like your hair, little boy. It's a pretty red."

That settled the issue between them. To be hailed as little boy was bad enough, but to be reminded of his crowning misfortune was adding insult to injury. He rose and cautiously approached the fence with the intention of pinching the impudent stranger, suddenly and surreptitiously, and sending her away weeping. As his hand crept between the palings on his wicked mission, the little miss looked at him in friendly fashion and queried:

"What's your name?"

Bryce's hand hesitated. "Bryce Cardigan," he answered gruffly.

"I'm Shirley Sumner," she ventured. "Let's be friends."

"When did you come to live in Sequoia?" he demanded.

"I don't live here. I'm just visiting here with my aunt and uncle. We're staying at the hotel, and there's nobody to play with. My aunt's name is Pennington. So's my aunt's. He's out here buying timber, and we live in Michigan. Do you know the capital of Michigan?"

"Of course I do," he answered. "The capital of Michigan is Chicago."

"Chicago?" she asked.

"That's right. It's Chicago."

"I live there—so I guess I ought to know. So there!"

Bryce was vanquished, and an acute sense of his imperfections in matters geographical inclined him to end the argument. "Well, maybe you're right," he admitted grudgingly. "Anyhow, what difference does it make?"

She did not answer. Evidently she was desirous of avoiding an argument if possible. Her gaze wandered past Bryce to where his Indian pony stood with her head out the window of her box-stall contemplating her master.

"Oh, what a dear little horse!" Shirley Sumner exclaimed. "Whose is he?"

"That's a he. It's a she. And she belongs to me."

"Do you ride her?"

"Not very often now. I'm getting too heavy for her. So Dad's bought me a horse that weighs nine hundred pounds. Midget only weighs five hundred." He considered her a moment while she gazed in awe upon this man with two horses. "Can you ride a pony?" he asked, for no reason that he was aware of.

She sighed, shaking her head resignedly. "We haven't any room to keep a pony at our house in Detroit," she explained, and added hopefully: "But I'd love to ride on Midget. I suppose I could learn to ride if somebody taught me how."

He looked at her again. At that period of his existence he was inclined to regard girls as a necessary evil. For some immutable reason they existed, and perforce must be borne with, and it was his hope that he would get thru life and see as little as possible of the exasperating sex. Nevertheless, as Bryce surveyed this winsome miss thru the palings, he was sensible of a sneaking desire to find favor in her eyes—also equally sensible of the fact that the path to that desirable end lay between himself and Midget. He swelled with the importance of one who knows he controls a delicate situation.

"Well, I suppose if you want a ride I'll have to give it to you," he grumbled, "alho I'm mighty busy this morning."

"Oh, I think you're so nice," she declared.

A thrill shot thru him that was akin to pain; with difficulty did he restrain an impulse to dash wildly into the stable and saddle Midget in furious haste. Instead he walked to the barn slowly and with extreme dignity. When he reappeared, he was leading Midget, a little silver-point runt of a Klamath Indian pony, and Moses, a sturdy pinto cayuse from the cattle ranges over in Trinity County. "I'll have to ride with you," he announced. "Can't let a tenderfoot like you go out alone on Midget."

All adutter with delightful anticipation, the young lady climbed up on the gate and scrambled into the saddle my aunt's. He's out here buying timber, and we live in Michigan. Do you know the capital of Michigan?"

"Of course I do," he answered. "The capital of Michigan is Chicago."

"Chicago?" she asked.

"That's right. It's Chicago."

"I live there—so I guess I ought to know. So there!"

Bryce was vanquished, and an acute sense of his imperfections in matters geographical inclined him to end the argument. "Well, maybe you're right," he admitted grudgingly. "Anyhow, what difference does it make?"

She did not answer. Evidently she was desirous of avoiding an argument if possible. Her gaze wandered past Bryce to where his Indian pony stood with her head out the window of her box-stall contemplating her master.

"Oh, what a dear little horse!" Shirley Sumner exclaimed. "Whose is he?"

"That's a he. It's a she. And she belongs to me."

"Do you ride her?"

"Not very often now. I'm getting too heavy for her. So Dad's bought me a horse that weighs nine hundred pounds. Midget only weighs five hundred." He considered her a moment while she gazed in awe upon this man with two horses. "Can you ride a pony?" he asked, for no reason that he was aware of.

She sighed, shaking her head resignedly. "We haven't any room to keep a pony at our house in Detroit," she explained, and added hopefully: "But I'd love to ride on Midget. I suppose I could learn to ride if somebody taught me how."

He looked at her again. At that period of his existence he was inclined to regard girls as a necessary evil. 100

A Time Saver on the Farm

Last year I had a big patch of ever-bearing strawberries and naturally in the spring there were "about a million" fine runner plants. Now everyone enjoys a reasonable number of choice berry plants but no one wants a million, so I inserted a small ad in our nearest city paper expecting to sell a few to near neighbors perhaps, but the orders came pouring in thick and fast, some even coming from distant states. I wasn't prepared to do an extensive shipping business but I explained the fact to my customers, filled orders to the best of my ability and netted quite a neat little sum. I intended at the time to raise tomato and cabbage plants this year, advertise the whole bunch early, and make a business of selling plants. As it happens, however, I am teaching so I shall do nothing with any of these but hereafter, whenever I am at home and therefore interested in farming operations, I shall advertise every thing I have to sell and I am sure that it will pay well to do so.—E. M. A.

Lackawanna Co., Pa.—There will not be much fruit of any kind in our county, owing to the freezing weather March 28 and 29, and two cold snaps in April with a steady downfall of snow on the 18th. It was an unusual sight to see the trees hanging full of fruit blossoms weighted down with snow. Farm work is going steadily on, plowing, hauling manure, sowing oats and spreading lime besides other spring jobs too numerous to mention, are the tasks that keep us busy. Robins and bluebirds are filling the air with music, young chicks are peeping for feed, piggies are scampering around their pens and enjoying the warm sunny days. Potatoes are selling for 60 cents per bu.; butter 34 cents lb.; eggs, 35 cents doz. Heavy rains have made the newly worked roads a mass of mud.—E. A. K.

Northumberland Co., Pa.—The month started in wet with three days of rain that stopped all work in the ground for awhile. Much of the oats is yet to be sown, and no corn is planted, but a few potatoes are in. The leaves and decayed blossoms are coming out earlier this spring than usual. Grass and winter grain is looking exceedingly good for the open winter it had. Good progress is reported from all road contractors and no trouble getting material or help to push the work along. Shops are still cutting down their forces and running three or four days a week. Wheat is as low as \$1 per bu. at some mills. Corn, 60c; oats, 35c. New potatoes on the market for \$5 per bushel. Butter is selling at 45c pound, and eggs, 24c doz.—M. E. Murray.

A friend is one who makes us be
our best.—Merson.

There are fewer chores than when horses do the hauling. The sturdy, reliable International requires little attention. Unsurpassed International service prevents delays and assures low cost operation. This saving in time alone makes the International

The four-cylinder block-cast, valve-in-head engine has abundant power and sturdiness to meet all farm hauling demands. Every part measures up to the rigid standard of quality set by International engineers. Capacities range from 1,500 to 10,000 pounds. Body types include grain-tight boxes, stock racks, hay racks and other styles.

Let the nearest International Motor Truck dealer show you why International trucks increase farm profits.

Excess is the arch enemy of success

Prizes for Young Farmers

ON PAGE 12 of this issue will be found an announcement of the activities which are planned for the boys' and girls' club members and other young farmers of Pennsylvania at the Annual Summer Farmers' Week to be held at State College in June. Pennsylvania Farmer believes that the boys' and girls' club and vocational school work is of great benefit to the state's future farmers. In order to promote interest in this work and enable our readers to become more fully acquainted with the results obtained we are offering ten prizes for the best essays dealing with the benefits derived from these activities. Full announcement of rules and conditions will be made in a future issue.

Pennsylvania Farmers Buncoed

IT IS GALLING to all who have the best interests and larger vision of Pennsylvania agriculture at heart to read of the extensive plans which other states are making for their state fairs this year and remember that the plans for establishing a state fair in this state were sidetracked by political log rollers and provincially minded county fair managers. On no other question, with the possible exception of opposition to the daylight-saving bill, has there been such unanimity of opinion as in the demand for the establishment of a state fair. The original bill which provided for the appropriating of \$250,000 was amended so that only \$15,000 is made available for a commission to investigate the project. Thus two years are lost before any really constructive move can be made. However, farmers will do well to accept this make-shift as bona fide intent and make plans to press the matter so strongly two years hence that the Legislature will not dare give a stone when bread is demanded.

Liberal Arts and Agriculture

WHAT is the one great thing that prevents the farmers of the country from taking their proper part in the social and political activities of the United States? It is an acknowledged fact that they make up the most important single group in the whole economic scheme of things, yet they do not have a proportionate influence in the government of the country. They have had great dreams and have made great plans but in most instances these ambitious dreams and altogether worth-while plans have failed to materialize.

Dr. J. M. Thomas, President of the Pennsylv-

Pennsylvania Farmer

May 28, 1921

vania State College, speaking before the recent Spring meeting of the cattle feeders of the state, expressed the belief that the farmer's great need is a liberal education. It is important for the food producer to be familiar with all the up-to-date methods of production, but it is also important that he be familiar with other things besides mere farm efficiency. If he is going to get the greatest enjoyment out of life, reap the greatest rewards for his labor, and do the most for the benefit of his fellow men he must have a thoroughly rounded out education. He must study history to know how other men have lived and be able to profit by their mistakes. He must be familiar with the great principles of economics so as to understand the problems of marketing and distribution and be able to combat the fallacious arguments of those who would keep control of agricultural products, putting their own interests above those of both producer and consumer. He must know political science that he may be prepared to take part in the making of laws governing the industry of agriculture which not only provides the food for mankind but which also produces forty per cent of the raw materials used in the industries of the United States.

At the present time the agricultural student at the Pennsylvania State College spends a large part of his first two years there in doing work in the School of Liberal Arts—work which prepared him for a better understanding of the problems which arise when he takes up the technical side of farming. Without in any way detracting from the importance of the study of farming problems, the importance of these other subjects should be emphasized. A broad education, whether gotten in college or on the farm, or partly in both places, is essential to the realization of the greatest things in agriculture.

Farm Prices and Others

IT IS easy to understand why one ingredient of a mixture of different materials will settle more quickly than others in a pail of water: It is because of the difference in specific gravity. It is not so readily seen why the prices of farm products go plunk to the bottom when business conditions become "unsettled," while other products remain long "in suspension." Herbert Hoover, in a letter to Senator Capper, quotes the following index numbers as typical in April:

It is obvious enough that this industry is suffering bitterly from the unequal progress in the various steps in economic readjustment. This is evidenced by the following recent typical index numbers—100 being 1913:

Farm crop prices	115
Farm meat animals	123
Building materials	212
House furnishings	275
Clothing	192
Fuel and light	297
Railway rates	166
Building-trade wages (skilled)	177
Wholesale index, all commodities	162

Certainly these levels must come into step or the agricultural industry and its standards of living will be undermined.

This condition is not justified by the belief that agriculture can stand such a state of affairs without going into bankruptcy longer than others, yet men in other industries show little inclination or willingness to do their part in bringing about an equitable readjustment. The farmer is told that "natural causes" operated in the case of his prices. Is he then to understand that unnatural causes are operating in other lines?

A Whole County Plays

THOSE who may be inclined to pessimism over the decline of neighborhood sociability and community spirit would do well to attend the annual Play Festival held by Chester County at West Chester, Pa. This year it was held on May 14 and the popularity of the movement was attested by the largest crowd ever assembled in the town. The event is literally what the name indicates—a real play festival. The people came from every part of the county in thousands of automobiles and the assemblage included babes in arms and grandfathers and grandmothers and every age between. It was a gathering of the public school children and their families, and the "old folks" enjoyed it no less than the children.

In addition to the purely social and spontaneous features, the basis of the event is the contests which have been prepared for and previously arranged. Thruout the year local contests in sports and studies are held in the schools and the winners become contestants in the County Play Festival. These contests include singing, declamation, drawing, the different studies, games, athletic sports, etc. The exhibits from the high schools and vocational schools form a pleasing and instructive feature. We know of nothing better calculated to promote acquaintance, sociability and real, live community spirit than the county play festival idea.

Our Washington Letter

After extensive hearings before the Committee on Agriculture, the Tinscher grain futures trading bill, passed the House by a vote of 269 to 69. As a result of these hearings, several recommendations made by Secretary of Agriculture Wallace and representatives of the grain exchanges were incorporated in the bill. The bill restricts sales in futures, prohibits transactions known as "puts and calls," and provides for the establishment of contract markets under the supervision of the Secretary of Agriculture.

The Townsend highway bill is now under consideration by the Senate Committee on Post Offices and Post Roads, of which Senator Charles E. Townsend of Michigan is chairman. Many representatives of the automobile and automobile manufacturers' associations, highway engineers, and farm organization leaders have appeared before the committee. The opening statement was made by Dr. T. C. Atkeson, Washington representative of the National Grange.

Senator Townsend says that he considers the expenditure of \$100,000,000 for a system of national highways as a solution for transportation interstate commerce, and to a great extent, employment problems now holding the nation, to be the most valuable investment he can imagine. "My idea," he says, "is that there be a commission of five to supervise Federal highway projects, chosen for their ability not political affiliations. This body as a department, and not a subsidiary bureau, would care for the difficulties of land travel."

The chief point of opposition is centered in the provision giving to the Federal Government authority to decide as to where highways receiving Federal aid shall be located. It is argued that this is unfair to the states which are compelled to appropriate one-half the cost of construction and all the cost of maintenance of the government highways system. Another objection is based upon a pretty well defined belief that commission government is contrary to our national ideals and that this phase of government administration should be curtailed rather than expanded.

Hearings on the "Slack-filled Package" bill before the House Committee on Agriculture are bringing out some interesting disclosures showing the necessity for a law to prevent the use of containers shaped so as to deceive the purchaser as to the quantity of the food contained therein. It was shown that many packages are partly filled, in some instances containing but one-third of their apparent capacity. The testimony before the committee indicates that the practice of deception by partially filled containers and by using containers which appear to hold a greater quantity than they actually hold has increased tremendously in the past years.

Representatives of the national associations of food manufacturers and wholesalers agreed in the main with the bill. A representative of the International Apple Growers' and Shippers' Association and the Farmers' Co-operative Marketing Association, while strongly favoring the bill, offered an amendment providing that fruits and vegetables in their natural unmanufactured state, when in original packages shall not be subject to the provisions of the bill, if by reason of shrinkage or the use of necessary quantity of suitable material the package is not filled with the food it purports to contain.

A bill introduced by Senator Kenyon of Iowa increases the amount of interest which can be paid on farm loan bonds from five to six per cent. The original act limits the amount of interest to five per cent and makes it possible to charge the borrower not to exceed one per cent in excess of the interest paid on the bonds, thus making the interest rate of farm mortgages not to exceed six per cent. This total of six per cent is not to be raised under the Kenyon amendment, but the banks will have to do business on a smaller margin. If the bonds sell as high as 51 per cent the banks would have to do business on one-half of one per cent.

The Johnson bill passed by the House and Senate limits the number of immigrants to come into this country between now and June 30, 1922, to 355,000 people. In view of the proposed restrictions it is interesting to note that only 2.8 per cent of the vast number of immigrants entering this country last year were farmers.—Elmer E. Reynolds.

May 28, 1921

HARRISBURG LETTER

The End of the Legislature.—The legislative session really ends this week. Atho the general assembly adjourned on April 28 the work of the lawmakers will not be complete until the Governor finishes acting upon the bills on Saturday and then the history of one of the most remarkable legislative gatherings may be written. The constitution allows the Governor thirty days in which to dispose of bills after the gavel falls and this year the Executive has certainly needed that time. It has taken many days to get a line on the finances and the final count of the legislative bills carrying money shows that something like \$139,000,000 was passed or about \$20,000,000 short of the revenue which can be counted upon with safety. The Governor says he proposes to do some vigorous cutting and the places where he cuts will be interesting to observe. There are two profitable lines for a Governor wishing to make a record—expenses of government and charities not under control of the state.

Delays in Laws.—Owing to the strike of the printers here the issuance of the laws approved has been held up and there have been some curious situations developed, people having sent men to Harrisburg to make copies of official acts and others having typewritten or mimeographed copies certified as official. In the case of the laws affecting departments of the government the officials have been able to get copies and then inform their people at the same time they give instructions. The Department of Public Instruction has issued a notable compilation of school laws which shows what each district will be called upon to do and what it will receive.

Assessors to Help.—Arrangements are being made by the Department of Agriculture to call upon the assessors to gather first hand data regarding crops and acreages as they do cattle for the triennial assessments. It is the plan of the statistical authorities to handle the proposition thru county commissioners and to return to each county such data as its officials may desire for their own use so that the assessors' returns will not only aid in getting reliable statistical compilations, but also furnish county tables for the first time.

May Enforce Law Soon.—Unless steps are taken by owners of orchards and farms in eastern counties to help exterminate the yellows it is possible the state may launch some test cases under the newly approved fruit tree disease act. This bill was drawn to meet numerous occasions which had arisen and where trees are not removed and diseases abated the owner is liable to \$100 fine.

Ten Dog Districts.—It is probable the State Department of Agriculture will establish ten districts for enforcement of the dog license act. These districts will be groups of counties each in charge of an agent who will direct prosecutions, the handling of the licenses being entirely for county treasurers, who will receive ten cents for every dog.

Will Test Horses.—One of the results of the conference conducted by the Bureau of Animal Industry this week was decision to test horses as well as cattle when state agents go to a farm on a hunt for tuberculosis. The conference was productive of valuable demonstrations and it came out that tuberculosis needed all the attention that could be given to it in dairy cattle, horses and poultry. It is believed effective work for stamping out certain parasitic diseases of sheep and for diminishing hog cholera was launched. The figures produced by Director T. E. Munce showed conclusively that while Pennsylvania is rapidly rising in the record of certified or accredited herds free from disease the investment in cattle, horses and poultry is so enormous constant vigilance must be maintained.

Can Insure Crops.—Pennsylvania can insure crops, just as is done in other states, under the terms of the new insurance code. For some time this state has had insurance against damage by hail or storms, but now policies may be written against damage by pests, weather or any other cause.

NEW YORK LETTER

Guernsey Sale.—Guernsey breeders are planning the biggest sale for September ever held in the state. Sixty of the best tuberculin tested females and several prize bulls will be offered to increase interest in the breed.

Apple Grading Law Benefits.—In the five years that apple grading has been enforced in the state the grade of state apples has been improved and consumers have been able to secure better fruit. An intensive campaign is to be begun this year to make New York apples, which are superior in flavor, as popular as western apples. Packing houses are considering the use of boxes as better suited to the market.

Dairy Marketing Conference.—New York farmers approve the latest step of the National Farm Bureau in appointing a committee of several dairy experts to study dairy marketing problem. The big national conference of representatives of 61 co-operative dairy marketing organizations approved the Dairyman's League pooling plan as correct in principle.

Dairy Herd Test Work.—Tompkins County plans to have work done by cow testing associations as a means of improving herd production. Franklin County has just started association testing. Otsego County is attracting attention because of successful results from testing. One dairyman who tested found he had slaughtered a pure bred bull who had 5 daughters that averaged over 13,300 lbs. of milk and 525 lbs. of butterfat. Some cows were found to produce 24 times as much as others. All feeding methods were improved, one man being able to make his calves gain 24 lbs. a day.

More Libraries.—The Governor has signed a bill encouraging more town and country libraries and the extension of the service of the state circulating libraries, also to make easier the establishment of free libraries, both publicly and privately supported.

NEW JERSEY NEWS

Milk Price Drops.—The retail price of milk in Trenton and other South Jersey communities is now 11 cents per quart or 7 cents per pint. This cut resulted from a conference of milk producers and distributors and manufacturers of milk products. The price was reduced two cents per quart, the farmers taking one and three-quarters cents of the drop. Cheese prices have also decreased along with other dairy products until pre-war prices are in force.

Fish and Game Chart.—The State Fish and Game Commission has issued a chart for 1921 from its headquarters in the State House, designating in black and white squares the open and closed seasons for fishing and gunning. They are free upon application to the secretary of the board. Hunting and fishing licenses apply only in fresh waters in the state, as to fishing, while no licenses are needed to fish in the Delaware River thruout its entire length nor in tidewater, so the report says, while it adds that tidewater means the extreme reach of a normal tide.

Warning on Containers.—New Jersey farmers and shippers of fruits and vegetables, who pack produce in closed containers for the market, are warned in a letter sent out from the State Department of Weights and Measures to all growers' associations

Pennsylvania Farmer

5-561

and granges thruout the State, that they must comply with the law requiring that such containers be marked with the name and address of the packer. The marking law has for its object honesty in shipments of commodities in closed containers. The practices of underfilling and toppling were so generally employed some time ago, that the reputation of this state for fine produce and honest weights was being impaired.

Guarding Forest Fires.—The establishment of the proposed State Constabulary on July 1, when the legislative appropriation for its use becomes effective following the appointment of a superintendent by Governor Edwards and confirming by the Senate in June, will be a valuable asset in checking forest fires in New Jersey, according to the officials of the State Department of Conservation and Development in charge of forestry.

Beekeepers Are Active.—Much activity is apparent among the beekeepers of the State, but particularly those of Mercer County and other Central Jersey sections. The Mercer beekeepers have planned a schedule of meetings which will be held as follows: May 27, Vineland, Frederick Green's apary; June 18, Orange, P. H. Fowler's apary; July 12, Sunnyside, Hunterdon County, Ross B. Pickel's apary; August 30, Arcola, Bergen County, Wygant and Van Buskirk's apary. The Mercer association has performed some very creditable work, tending to a fine exhibit of bee products at the Trenton Inter-state Fair in the coming fall. Arrangements have been made for the giving of larger premiums, so long as beekeepers show their interest by putting up worth-while exhibits.

MARYLAND LETTER

In an effort to improve living conditions on Maryland farms, the Extension Service of the University of Maryland, aided by the United States Department of Agriculture, is making a survey of conditions. They are sending questionnaires to the wives of farmers and inquiring as to the various advantages, the social facilities and home conditions of the rural families. One of the greatest needs of the farmers according to the questionnaire is the necessity for more system and efficiency in the operation of rural homes.

At a meeting of the Eastern (Md.) Farmers' Association last week the committee appointed to wait on the Threshermen's Association with a view to adjusting the price of threshing wheat, reported that the threshers refused to reconsider their demand for eight cents a bushel. The farmers have agreed not to pay any more than five cents a bushel, some contending that threshermen not affiliated with the association have promised to thresh for that price. The committee reported that the threshermen refused even to consider a change in price, and insisted on eight cents.

What will be planted in place of sweet corn and tomatoes? This question is agitating the farmers of the Eastern Shore now since these two crops will be practically ignored this year, as the canners have refused to make contracts. John A. Arringdale, president of the Farmers' Federation of Talbot County, has been in conference with the canners on the prospects of putting up lima beans. If they prove profitable, there may be a new industry grow out of it as far as Talbot county is concerned.

Altho the late frosts and freezes were believed to have killed the grapes in Kent County on account of the advanced condition of the blossoms, it is now stated that there will perhaps be one of the largest crops harvested in recent years. Altho the buds had fallen and tiny grapes had started before the freeze came, new blossoms are putting forth and the vines show every evidence of producing an abundance of fruit this season.

Hail as large as shellbacks fell in Frederick County last week during a heavy rain storm, but not much damage was done. The rain precipitation for one week broke all records in a six-year period. It totaled almost five inches.

DIG YOUR POTATOES THE FARQUHAR WAY

A Farquhar Digger will get you more marketable potatoes, and besides save much labor. These machines are sufficiently strong to stand the strain of hard continuous usage. They dig clean, and leave the potatoes convenient for picking. The No. 1 Elevator shown above has paid for itself in one season for some users. Rigid tongue construction holds Digger steady on the row avoiding cutting. Either Cross Bottom or Angle Bucket Elevator to suit different soils. Larger size Elevator Diggers for deep planting and bad conditions. Engine drive, if desired. Our Success Jr. is the peer of Plow Diggers. Prices low with in reach of the smallest grower. The Gift Edge for those who desire more elaborate Walking Digger.

Large illustrated Digger Catalog free on request. Every grower owes it to himself to send for this booklet.

A. B. FARQUHAR CO., Ltd., Box 246 York, Pa.
Also Engines and Bolters, Tractors, Saws, Millstones, Old Iron, etc. Write for literature.

Aspirin

Then It's Genuine

Unless you see the name "Bayer" on tablets, you are not getting genuine Aspirin prescribed by physicians for 21 years and proved safe by millions. Always say "Bayer."

Aspirin is the trade mark of Bayer Manufacture of Monaceticacidester of Salicylicacid.

COMBAULT'S CAUSTIC BALSAM

The Perfect Liniment
For External Use on
The Human Body

It is astonishing how quickly Caustic Balsam relieves Stiffness and Lameness, Rheumatism, Neuralgia, Strains, Sprains, Lumbago, Backache, Sore Throat, Chest Cold, Stiff Joints, etc.

Serious results through Blood Poisoning are liable from scratches, cuts or wounds from rusty nails or other metal. This great remedy applied at once will prove a preventive, is a perfect antiseptic, soothes while it heals. *It has done for others it will do for you.*

PENNSYLVANIA FARMER
261 S. Third St., Philadelphia, Pa.

Of Interest to Farm Women and Girls

An Appeal to Sunday Visitors

I would appeal to anyone who contemplates making their friends a Sunday visit by automobile, whether you reside in city or country, do not go unexpectedly to any home and keep another family away from church services. Find out their church hours, previous to your visit and then manage to arrive afterward.

A plan that has been adopted by the autoists of my old home town works out admirably and most satisfactorily to all parties concerned. Perhaps eight or ten persons plan to visit some friends in a nearby town. No matter how many go—they all carry a picnic lunch with them, letting the hostess know in advance of their coming. The hostess then generally provides the tea and coffee, and perhaps ice cream or sherbet for all, or perhaps she may serve just peaches and cream, strawberries and cream, or some other nice dessert from the farm fruits.

The guests let her know before hand that they are bringing the dinner with them, also the time they expect to arrive. She then has a chance to get tables and everything in readiness for their coming. In this way there is genuine pleasure for everyone, and the hostess is not dead tired when the visit is over.

I would especially urge anyone to hesitate before making a Sunday visit anyway, unless they have received a special invitation to come that day. Remember, this day is the only day of the week that most of the rural folks get any chance to rest, and above all things, the busy farmer's wife needs that one day for church going and recreation.

Last summer one of my neighbors told me that Sundays were her hardest days of the week as that seemed to be the day all her friends and relatives chose to make her a visit, until there was absolutely never a Sunday during the whole summer, that she had that day to herself. Then, on account of the hard week's work and a full Sunday with no opportunity for rest, she was so exhausted that a greater part of the next day had to always be spent in bed.

Friends are too often inconsiderate or thoughtless in regard to these things. If one has ever lived on a farm they must know that most of the housewives are rushed to death almost during the hot season—with cooking for the family and extra helpers thru haying time and harvesting.

The present day is a hard time all over the country for housewives, both in the city and country, as it seems impossible to hire a girl or woman who will help with the housework, no matter what wages are offered. Not many years ago, help was abundant, and one could entertain much more easily than they can at the present time.

This subject has been taken up by the Home Bureau and other organizations. They are unanimous in the belief that this problem should be discussed and given good consideration with the view of finding a solution that will not curtail the old-fashioned hospitality but will help maintain the right amount of social-

bility which, for our own good, must be kept up.—E. M. L. B.

RECIPES Six-Minute Strawberries

1 cup of berries; 1½ cups of sugar. Sometimes try cup for cup. Place on stove together and cook 6 minutes. Delicious.

Salad Dressing

Two eggs beat very light; ¼ cup sugar; pinch salt; piece butter size of a walnut; 1 cup cold water; 8 tablespoons vinegar; ¼ teaspoon mustard. Boil until it thickens. If kept in a cool place it will keep for quite a while. Use same for cold salad, only substitute cream for cold water and omit mustard.—Mrs. O. B. H.

A WORTHWHILE GIFT

The home convenience truck of the Agricultural Extension Service of the Missouri College of Agriculture, gave its first demonstration in Howard County starting Thursday, May 12. The first was on John Payne's farm near Ashland Church, the second on the farm of S. H. Woods, three miles east of Armstrong and the third meeting on the farm of Edwin Lewis one mile east of Glasgow. An actual installation of a sink, drain and pump was made in the house of S. H. Woods as a birthday gift from Woods to his wife.—Missouri Farm News.

MAKING CHILDREN GROW

In addition to the right sort of food, rightly prepared and rightly fed, children need plenty of sleep under the right conditions. This means regular time for going to bed, plenty of fresh air in the room, quiet and no lamps burning to use up the oxygen in the air and to disturb the optic nerves. In the case of young children, there should be one or more rest and sleep periods during the day.

Age	Hours
First year	18 to 20
2nd to 3d year	14 to 18
4th to 5th year	13 to 16
5th to 6th year	13
6th to 8th year	12
8th to 10th year	11½
10th to 12th year	11
12th to 14th year	10½
14th to 16th year	10
16th to 18th year	9

Other Essentials

Have the child play outdoors some every day. Train the child to drink four to six glasses of water every day. Children may think they cannot drink so much water, but they can gradually learn to drink four to six glasses a day. Nearly three-fourths of the body is water, and it must be constantly supplied to keep the blood and other fluids of the body of the right liquidity, to keep the tissues soft and flexible, to furnish the right dilution for the digestion and absorption of food materials, to flush the system and eliminate waste products. And you must also see that the child has the right kind and amount of food to meet the needs of a growing body.—Pearl McDonald.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3528.—Popular Housework Frock.—The pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size will require 7 yards of 24-inch material. The width of skirt at lower edge is 2½ yards. Pattern, 10 cents.

3529.—Handy Attractive Apron.—The pattern is cut in 4 sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. Medium size will require 3½ yards of 36-inch material. Pattern, 10 cents.

3497.—"Easy to Make" Apron.—The pattern is cut in 4 sizes: small, 32-34; medium, 36-38; large, 40-42; extra large, 42-48 inches bust measure. Medium size requires 4½ yards of 36-inch material. Pattern, 10 cents.

3502.—Neat House Dress.—The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size will require 6½ yards of 36-inch material. The width of the skirt at the foot with plaits extended is about 2½ yards. Gingham in check or plaid patterns, striped seersucker or percale are suitable materials. — Pattern, 10 cents.

A great promoter of neighborliness is owning a pressure cooker co-operatively. Does your neighborhood have one?

A pint of milk a day for each adult and a quart for each child does not mean all this milk must be drunk. When used in cooking, its effect on health is the same.

Backyards express personality, and a man is judged by the tin cans and rubbish piles he keeps.

Lots of action and little noise is a sign of a well-regulated home.

The Voice of the People

PROTESTS TRUCK LICENSE FEES

An open letter to Senator Buckman with suggestions:

April 30, 1921.
Hon. Clarence B. Buckman,
Harrisburg, Pa.

Esteemed Friend:

On behalf of farmers I am sending a protest against the present system of collecting license fees from motor-truck owners. Money for highway maintenance should be collected on a mileage basis. Farmers as a rule make a very small mileage with their trucks. Their business is on the farm and not on the roads except for hauling produce to market and supplies home and you can easily figure that this mileage could not be very great compared with other business where trucks are in daily use.

The new increased fees for motor trucks will make farm motor truck ownership a doubtful proposition, except for those who do a large business. Take my own case as an illustration. I make about 2000 miles per year from a 100-acre farm and go to market three times a week in season. (The grain farmer will not make one half as much mileage). My license fees next year will be about \$10 in Pennsylvania, and the same in New Jersey, or 4 cents per mile for fees alone. Adding 22 cents for local road tax makes 6½ cents per mile for road maintenance.

How much would a motor truck corporation or owner pay for running the same sized truck a dilly trip from Philadelphia to Trenton and return, sixty miles or about 20,000 miles per year? Just .04 cents per mile. Probable not owning any real estate and therefore paying no local road tax. Is it a fair and just system that charges a farmer 6½ cents per mile traveled for road maintenance and a business truck 4 cents per mile for the same service? Or putting it another way, the farm and other truck owners whose business requires a small mileage, are building the roads for heavy mileage trucks to use almost free of charge. I am surprised that a Senator who is supposed to represent a farming district should introduce a bill which is so manifestly unfair to farm truck owners and at a time when farmers are facing a season in which profits are impossible, an account of high cost of supplies and less-than-pre-war prices for produce.

There is no more common sense in charging for road building by the license fee system than there would be for a gas company to charge for gas at so much per burner without regard to the amount of gas used.

It trucks wear out the roads they should be made to pay for doing it and the trucks standing on farms should not be made to pay for roads worn out by trucks in constant use. I do not believe in kicking against something better and here is a better method, not well thought out, but suggested as a working basis for future legislation by all states.

First—State Highway Department to issue license tags only to trucks equipped with high-grade odometers under department regulation and sealed by agents of department.

Second—Fees to be collected at rate of 1 cent for mile (more or less as needed) and on a sliding scale as to weight of truck and solid or pneumatic tires.

Third—Odometers subject to inspection by road officers at all times and absence of meters subject to heavy fine.

Fourth—Odometers to be tested at any time and place by authorized agents of Highway Department, and if found not recording, owner subject to fine. This would place upon the truck owner the whole burden of keeping meters in order or of letting them alone.

High grade and reliable odometers might have to be perfected and money might well be spent for this purpose at once.

Trusting that this matter may have your sincere consideration and that I may hear from you,
I am respectfully yours,
R. P. LOVETT,
Bucks County, Pa.

REMAKING RURAL COMMUNITIES

(Continued from Page 2).

The Center consolidated school, located some little distance from the Sargent school is probably destined to become one of the most famous consolidated schools in the United States. This building was dedicated in the spring of 1920 and the school district there embraces 153 square miles. This building is said to be the largest consolidated school building in the United States. At least it must be in length, for it is 308 feet long, and there are thirty-five rooms in the building. Center is just a small town of around 800 population, located fifteen miles north of Monte Vista on a spur line of railroad. Part of this district lies in two different counties.

In order that the school might have a good setting, thirteen acres of land were purchased at one side of the town. This will make it possible to maintain agricultural plots and develop fine grounds, which will become almost a park. Perhaps the most notable feature of this school is the splendid auditorium, probably one of the finest school auditoriums in any town of less than 50,000 population in this country. It has a seating capacity of 700 persons, and permanent theatre seats have been installed both on the main floor and in the balcony. There is a real stage, fitted out with scenery and a curtain, which alone cost \$300.

The building has a gymnasium, 36 by 70 feet, with a spectators gallery opening off the second floor of the building. There are shower baths and dressing rooms under the gallery. At one side of the gymnasium is a kitchen, where banquets may be prepared and served in the gymnasium. It is especially interesting to note that on the day of the dedication 2000 people were served at a big dinner at this school. It is needless to point out that it is perfectly equipped mechanically with electric lights, heating and ventilating systems, and telephones in each room.

The total cost of the building was about \$112,000. The first bond issue of \$82,000 carried by a vote of eight-three to five, and a second bond issue of \$45,000 for the completion and furnishing of the structure carried unanimously. There are some 400 pupils in the school, about half of whom come from the open country. The budget for one year's running expenses is about \$28,000. I recall that on the day of the dedication one man who had just purchased a farm not so far away visited the school to see how he could get inside of the consolidated district. Students in the high school here receive instruction in college preparatory, commercial work, vocational agriculture and vocational home economics, just as they desire.

Any one who is at all pessimistic with regard to consolidated schools would do well to take a trip to the San Luis valley and see just what has been accomplished. There are other consolidated schools in the valley, but these are outstanding examples. That consolidated schools can exist is proved by the fact that they do exist. The simple fact is that the children in these communities are getting good educations, just as good as they could in any city.

Editor's Note—This is the third of a series of articles on consolidated schools. The fourth, dealing with schools in Indiana, will appear in a future issue.

WEAVER PIANOS

"When you and I were young"

THE old songs have new thrills and new meanings when played on the Weaver. It lends to them its rare sweetness, purity, and power of tone—a tone that is beyond compare.

Nor are these qualities in the Weaver mere chance. They are inherent in every Weaver. They are the result of thought and painstaking care on the part of the Weaver craftsmen.

Fifty years of effort have given them a skill in pianoforte making of which they are jealously proud. And this pride goes into every Weaver. The result is a mechanical and artistic triumph.

There is a great satisfaction in owning an instrument which has the commendation and approval of some of the world's leading musicians. This the Weaver Piano has. It will have your commendation and approval, too, once you become the owner.

HORTICULTURE

Cantaloupe Seed Selection and Spraying

THE cantaloupe is one of our fruits that demands rigid seed selection in order to make a success of its culture. Last year while selling our crop on first starting out the people asked the price and altho the fruit was placed at a reasonable figure they declined to buy saying they wished they could be sure of the flavor of the fruit. Immediately on seeing the trend of the people's thoughts we decided to allow the people to sample the melons and as soon as the buyer was approached a slice of the melon was offered for inspection and eating. The fruit was sold almost as fast as it could be unloaded from the truck, and what was left in the bottom was the fruit that had been mauled by the buyers and bruised on the road. Early melons of fair size and sweet juicy flavor are what are desired by the people, and in no other way can this be gained than by having our seed selected for us or doing the work of growing the seed ourselves.

The way we began our selection was by choosing heavily netted melons from apparently healthy sprayed vines. These melons were eaten at our own table and if the flavor and general appearance of the fruit met with our favor the seed was saved. This seed when saved was divided into lots the next year. The melons eaten during the early part of the season were given the preference of the good ground, and the following year showed a heavier yield of better flavored fruit.

In a separate space apart from the melon patch, especially selected seed was planted from vines that had showed promise of good performance. The plot certainly yielded a good crop of cantaloupes. Re-selection has been carried on every year and these cantaloupes always have a ready sale on the market.

Many farmers sell cantaloupes late in the season when the fruit is flat. It is sold at a very low figure and in most instances a man loses more than he gains for when he tries to sell other produce the people will remember the flat melons bought of him and will not be inclined to try his other truck.

If you have seen the cantaloupes grown for seed and the way they are harvested many farmers would be deterred from ordering from this source. Sometimes selected seed is used and sometimes not, the care given the crop is not always the best and the personal supervision such as a trucker would give this operation is generally neglected in the work of those chosen to grow the crop for seed.

It is wise to start a seed of known strain that has proven a success with a neighboring grower. Work upon this strain until you have it as near perfect as you can get it. Hill selection is the best and the fruit eaten by the family and judgment passed in this way is one sure method of gaining flavor to the melon. Two plants allowed to the hill will produce fruit of nearly uniform size. Earliness in the season is one of the desirable characteristics and hills developing mature fruit early in the

season should be selected and given the best ground and watched. Be sure to save enough seed for two years as one year may see the growth of the vines so poor or the weather so undesirable that the fruit will not be fit for selection.

Spraying

Blight, cucumber beetle and aphids are the greatest enemies to the cantaloupe. Foggy weather and heavy dews are another hindrance which allow blight to take a firm hold upon the patch. Cantaloupes should be grown as far as possible from cucumbers, pumpkins, squashes and even the proximity of the watermelon patch is undesirable. The watermelons may be covered with beetles and if the cantaloupes are some distance away there may be only a few but if they had been close together both alike would be injured by the beetles. Ground selected should not have grown cucurbits or melons for several years. Cutworms while the plants are young are a pest and spraying is ineffectual for these. Poisoned bran scattered over the field some time before the plants come up will help rid the patch of most of these pests, but replanting weekly until a sure stand is obtained is the best measure.

When the stand is obtained a hand spray delivering a dense, fog-like spray can be used until the plants begin to trail and are in blossom. When this stage is reached the power or horse spray that can deliver a vapor spray of 125 lbs. to the square inch will be found the best. Nozzles should be run close to the ground so that the undersides of the leaves will receive a good dose for it is here that the aphids lodge and that blight may first gain its foothold. A nozzle on either side of the row for the under side of the plants and spraying to the center of the plant together with those above will keep the plants in a vigorous condition free from disease and insects if the work is attended to every week. Care should be taken in moving the vines while spraying and picking the fruit to disturb the plants and stems as little as possible.

Bordeaux mixture standard strength should be used for the blight and arsenic in the form of arsenate of lead paste or powder for poisoning the insects.—James E. Toomey.

MARYLAND STRAWBERRY CROP

Maryland's strawberry crop is having difficulty in surviving the assortment of weather that has prevailed during the last two months. First it was warm weather that caused the plants to blossom prematurely, then spells of cold and warm weather to freeze and thaw them alternately, and lately it has been excessive rains to rot them. Despite this, berries from the lower Eastern Shore have been put on the market earlier this year than any year in the last quarter century. The rain has also affected wheat, according to reports, though the crop is still in fair condition.

Grow Hogs and Poultry on Semi-Solid Buttermilk

Quick, Economical Growth Means Less Feed, Less Time, More Money

Experienced feeders know the value of pure, rich buttermilk. Semi-Solid Buttermilk is fresh cream buttermilk with water taken out. Averages 50 lbs. to a barrel and makes 1000 gallons of rich buttermilk feed. All you do is add water. Ideal to mix and use in combination with grain, mash and other feed. Also acts as a wonderful tonic and conditioner. Keeps stock healthy and full of pep. Nothing better for fattening pigs and hogs. Write TODAY for further information on Semi-Solid Buttermilk and facts about feeding for profit.

CHICKEN CHOLERA

We have a disease among our chickens which we cannot do much for. Now they seem to sit around and the droppings are as green as grass, and physiced very much. Sometimes they only live a day and some of them live for about one week. I have given them salts in their feed, also permanganate of potash and hyposulphate of soda in the drinking water. I keep them in a clean and well sprayed house. I have lost about 40 of last year's chickens. We very seldom ever lose any. Can you tell me anything that will check it?—A. W.

The symptoms of greenish droppings would indicate that the birds have chicken cholera. It is a germ disease and often difficult to eradicate. In acute cases the hens may die in a short time and in chronic cases they may live several weeks.

Remove the healthy birds to new quarters and thoroly spray the old with a coal tar disinfectant such as zenoleum or creolin. Disinfect the drinking dishes. The germs of cholera will be on the ground and it will help eradicate the trouble to give all feed in a trough which is occasionally disinfected with a 5 per cent solution of carbolic acid.

Intestinal antiseptics are useful in controlling the disease. Dr. Kaupp recommends the sulphocarbates compound in one-half grain doses twice daily. Two teaspoonfuls of the following mixture are recommended three times each day: Sulphate of iron, 1 dram; dried blood, 1 ounce; tincture of opium, 1 ounce. The medicine can be given with water or thin food.

If the cholera trouble is quite bad and the flock small it might pay to dispose of them and start with new stock after the house and yards have had time to become free from the germs. However a personal inspection might be necessary to determine that, and the poultryman who owns the conditions can best determine whether it is best to try and cure the trouble or start over with new stock.—R. G. K.

JUNE POULTRY REMINDERS

If possible place the late hatched chicks where they will not be constantly trampled by older stock. If they are all on the same range build feeding crates for the chicks. These enclosures can contain fresh water, sow milk and a hopper of dry mash. Much of the scratch grain can be scattered in the enclosure. Most of the crowding and trampling is at feeding time and if the young chicks can avoid it, they will eat more and grow more rapidly.

The best results with pullets will occur when they can be separated from the vigorous and clumsy cockerels. This gives the pullets more advantages at the hoppers and there will be less crowding in the pullet colony houses. As the early maturity of the pullets bears an important relation to fall and winter egg checks it pays to give those birds the best of growing conditions.

Sometimes geese are allowed to range with the young poultry but is seldom good management as the geese wash off their bills in the

drinking water and make the water very dirty. They also eat from the hoppers and gather up much scratch grain and frighten the growing pullets. Profits with geese depend upon raising them on cheap feed and that means plenty of grass until fattening time but not much feed beside grass.

When buying new geese it pays to clip one wing to prevent them from flying. We once had a Toulouse gander fly nearly a mile from home the first day it had freedom on the range. Leave three feathers on the end of the wing to act as a support. Otherwise the bird will have no means of holding up its wing until the feathers return but three feathers left on the end will cross over the back and prevent the wing from drooping.

On many farms it is surprising how many different breeds of purebred poultry will be found running together. I have seen fine Buff Leghorn cockerels of show type running with Anconas during hatching eggs season and also fine white Leghorn cockerels running with purebred white Wyandottes and Barred Rocks. The reason is easy to understand. The breeders become tired of one kind of poultry and occasionally try a few of another breed. They dislike selling their old breed because the birds are needed for eggs. So both breeds are retained and soon the flock is mixed. The best results in breeding poultry cannot come from such methods. The successful breeders study one breed and stick to it. They do not jump from one breed to another and end up with a mixed flock with nothing beyond its meat value.

Experienced poultrymen do not bother with sex indicators to test out their hatching eggs. These devices have proven of no value and are not generally advertised by publications working for the best interests of the poultry business. The shape of the egg has no relation to the sex of the chick it will contain. Nature seems to know what is best and has so far furnished us with no clue that will determine the sex of unborn chicks.

Get after the rats early in the summer and you cut down the chances of losing chicks and poultry feed. A poultry farm is a fine boarding house for a rat family because of the quantity of grain and mash feeds which must be on hand at all times. Substantial buildings on concrete foundations help cut down the rat population.

In general poultrymen feel that the egg business would be greatly improved by a 12-cent import duty on eggs that are in the shell and a 15-cent duty on dried or frozen eggs. The number of Chinese eggs received in this country has not been large compared with the number produced in this country. But those eggs do add to the surplus and it is the surplus which controls the egg market.

Selling hatching eggs and day-old chicks helps the skilled poultryman to divert his egg production from the usual markets during the time when eggs are cheap. By the time egg prices climb he has produced early hatched pullets to start laying and help in keeping up the farm income.—R. G. Kirby.

Be Sure She Cleans

Retained afterbirth indicates a germ infection—that all your cows are likely to catch. Don't try to remove this afterbirth by the disagreeable hand method—the membranes are easily torn and further infected causing blood poisoning—besides you never get it all and serious results follow. B-K dissolves the adhesions, brings the afterbirth naturally, killing the germs and foul odors—no straining or irritation. B-K is much more effective and safer than Lugol's Solution, carbolic acid, or cal or tar disinfectants which do not clean the uterus but coagulate the matter and make the uterus more acid and irritated and are poisons. Do not be without B-K—You have in the one bottle—your protection against abortion—retained afterbirth—call scours—always ready. Ask your dealer or write us for our booklet. Get a gallon—the standard Farm Package. If your dealer hasn't that size, have him get it for you. Phila. Farmers & Dairymen's Supply Co., 1918 Market St., Phila., Pa. General Laboratories—Sole Mfrs.

Forage Crops for Swine

By W. H. TOMHAVE

PROFITABLE and successful for swine. It furnishes a reasonable supply of feed, especially during the early spring months and during the fall. During the months of July and August blue grass is not a very desirable pasture and some other crop should be provided during that time.

The use of annual crops in a rotation is an economical means of providing the necessary forage crops. These should be planted and pastured in a rotation. If a field of rye has been seeded in the fall it will provide early spring pasture before any other crop is ready. This crop does not supply an abundance of feed, but provides a succulence at a time of the year when the pigs and brood sows will relish green feed. A combination of Canadian field peas and oats makes a desirable mixture for early summer pasture. It should be sown at the rate of one and one-half bushels of oats and one bushel of the field peas per acre. A small amount of Dwarf Essex rape may be added to the mixture to good advantage. Successive seeding of some forage crop should follow at intervals of about four weeks up to the middle or latter part of the summer. Dwarf Essex rape has proven one of the most acceptable all summer crops for swine. It can be planted at any season, grows quickly and provides an abundance of feed if grown upon good land. The seed is cheap and this helps keep down the cost of growing the crop. The rape should be seeded at the rate of about 8 to 10 pounds per acre and the pigs turned on the pasture when the crop is from 8 to 10 inches high. A good field of rape can be pastured most of the season if it is given a chance to rest when pastured down for the first time. Other crops such as soy beans or field corn may be used to supply the pasture necessary.

Grain Supplements

Brood sows if they are in fair condition of flesh, can be maintained most of the summer on good forage crop without grain in addition. If they are bred for fall farrowing, it may be necessary to supply some grain during the latter part of the gestation period. During the early spring while they are suckling pigs and if they have large litters, they should have all the grain they will consume as any grain fed will be recovered in growth in the young pigs.

Young growing pigs cannot be developed on forage crops alone. An attempt to do so will be a loss of time and money. The small pigs should be fed all the grain they will consume up to the time they weigh about fifty pounds. After that period they should be allowed from two to three pounds of grain per 100 pounds of live weight daily in addition to good pasture. Such method of feeding will result in the most economical gains, although not as rapid gains as when a full grain ration is fed.

The grain mixture allowed will depend upon the kind of feed that can be secured. A very desirable mixture is one made up of corn meal

four parts, wheat middlings three parts, and tankage one part. If the tankage cannot be secured, 1½ part of oil meal will make a desirable substitute. This mixture should be fed twice a day at the rate suggested, depending upon the condition of the pasture. If it is inconvenient to feed twice daily, it may all be fed at one time.

Forage crops are usually planted in fields where there is no natural shade. This condition makes it necessary to provide shade of some kind. It is dangerous to keep pigs in an open lot without shade of some kind. Heavy losses are often encountered because of the lack of shade during hot weather. This shade may be provided by means of a rough board roof or old sacks, canvas or burlap nailed to a rough frame to protect the hogs from the hot sun. If trees can be included in the pasture lot, no further shade is necessary.

Plenty of clean water is as essential as feed and shade. It should be provided in such amounts that the hogs can have access to it at all times. Separate watering troughs are desirable although not essential. The water can be put in the regular feeding trough after the grain has been consumed.

The advantages of growing pigs by the forage route are numerous. It means a better and more uniform lot of market hogs than can be developed in a dry lot. They will be ready for market at an earlier age which usually means an added profit. The pigs are thriftier and give a more attractive appearance to the farm. The amount of grain saved is also an item of importance. No farmer can afford to continue growing swine without the use of forage crops and expect to meet the competition from the grower who follows an up-to-date method of production.

HORSE DAY A SUCCESS

The Horse Day held at the Bennett Farm one mile south of Indiana was very successful from every standpoint. Although the weather was not very agreeable in the forenoon, it was all that could be hoped for in the afternoon.

The large double barnfloor made a suitable auditorium for the 300 farmers who were in attendance. Baled hay was used for seats. The first speaker who was introduced by the Chairman, J. W. Warner, was Rev. J. T. Davis, representative from Indiana County. Rev. Davis spoke along the line of the importance of improvement of the livestock of Indiana County.

The next speaker, Dr. Church, deputy state veterinarian, outlined the new stallion law and gave valuable statistics relative to the present status of stallions in Pennsylvania.

Dr. Dick of the University of Pennsylvania gave valuable information in his address concerning Horse Power as compared with mechanical power. He mentioned the fact that 75 per cent of the horses of Pennsylvania, New York and the East are purchased from the Middle West.

The horse judging contest was the crowning event of the day. Two splendid rings of Belgian geldings were used in the contest. The presence of men from New York State, Ohio, Pittsburgh, Johnstown and all of the neighboring counties is surely evidence that there is an increasing interest in better horses. Many expressed the desire that Horse Day be made an annual event.

THE PROPER CARE OF DAIRY UTENSILS

Much spoiled milk and butter can be traced to half-cleaned milk pails and dairy utensils. Doubtless, had we the use of a powerful microscope, many utensils, supposed to be clean, would show millions of tiny bacteria. These organisms multiply with astonishing rapidity and cause strong tastes in milk and rancid butter, if they are not killed. Washing with lukewarm water is not sufficient to kill germs. In the first place it is important to have the right kind of milk pail. Wood should never be used, as it is almost impossible to clean a wooden surface. Galvanized iron is not the best material for milk pails, as the surface is too rough to be cleaned readily. Smooth tin is best and there should be just a few angles and seams as are found absolutely necessary.

The best way to clean milk pails is by the use of warm water and washing powder, soda or some of

strides in the industry. With a total of seventy-one associations now in operation, Pennsylvania ranks second in the United States in the number and scope of work accomplished in bettering dairy production.

According to a statement issued by the Agricultural Extension Division of the Pennsylvania State College, which directs county agent work throughout the state, 1922 farmers and dairymen are members of the 71 cow testing associations. A total of 771 "boarder" cows were discarded from their herds as a result of the test that showed them to be producing less milk than the cost of their feed warranted. This figure is somewhat lower than last year due to the fact that so many associations were operated for the first time in 1919 and the percentage of poor cows was much higher. Each year as the association members benefit from the tests the number of discards will decrease as the number of good cows grows.

There were 24,215 cows tested in

Gerar Pearl 23595, a Guernsey Cow With Some Excellent Records. She Has Several High-Producing Daughters and Grand-daughters

the commercial cleansers. A good stiff brush is preferable to the dishcloth. The latter is not sanitary, even at its best, while a good brush can be cleaned without much trouble. After a thorough washing, the pails should be scalded with boiling water. This treatment will kill many of the germs. Then hang the utensils in the sun so all water will drain out. The sun kills bacteria and clean air is death to the germs which make trouble. It is a good plan to have a regular place to hang the pails for drying. Never wipe them. Let them dry by evaporation. Live steam is the best disinfectant but this is not at hand on the ordinary farm, so scalding water may be used. It pays to take good care of the utensils. This also applies to the separator and the churn, where butter is made on the farm.—C. H. Chesley.

COW TESTING BOOSTS PENNSYLVANIA AS DAIRY STATE

Headed for better and greater milk production for Pennsylvania with the hope of establishing the state as the foremost dairy center in the country, Pennsylvania farmers and dairymen, with the assistance of the cow-testing associations are making rapid strides in the industry.

Uncle Ab says that the man who helps to scatter sunshine never stays long in the shadows.

Health is one of life's greatest assets for success; good health squandered is waste of efficiency.

Consider The Cost Per Year

The first cost should not be considered in buying roofing—it's the upkeep or repairs that makes the buying of cheap or inferior roofing poor economy.

CRABE TRIPLE WALL SILOS

The strongest, handsomest silo made

Invariably chosen by architects on fine estates not only for beauty but for strength. The Crabie will withstand the severest tests of weather and weight because of its triple-wall construction. Inside are closely fitted upright staves; around these is heavy, water-proof, frost resisting Silafelt; outside is the handsome, protective spiral Crabie covering that binds the whole silo into one compact, permanent, rain-proof, frost-repelling, leak-proof structure that keeps the silage from freezing and spoiling and saves expense.

You can rebuild your old stave silo into a Crabie, at half the cost of a new silo. Write today for full particulars, terms and agency offer. CRABIE SILO CO. Box 140, Norwich, N. Y.

New Ross Silo

SIZE 10 x 30 \$235

Delivered to your Station
Material High-grade Yellow Pine treated with creosote oil (by the best and pressure method) to an average of 1 and 1½ gallons of oil to cubic foot of lumber.
Anchoring System Equipped with Champion Interlocking Anchoring System, which includes Foundation Footings, V Rods, Malleable Straps, Bull Dog Clamps, Top Connections, Ladder, Pressed Steel Rungs, Skeleton Roof Frame.
20 Year Guarantee We guarantee the New Ross Silo against decay and rot for twenty years and we guarantee it not to twist, lean, move on foundation or blow over (unless due to exceptional forces) according to instructions.
Act Quick! We bought at a tremendous sacrifice, a stock of high-grade material suitable for New Ross Silos which we are selling at less than pre-war prices. As long as they last, about 30 days, those who act quick get biggest silo bargain ever offered. Write Dept. 271 THE E. W. ROSS CO., Springfield, Ohio.

TALKS WITH THE BOYS

Young Farmers at State College

THE young farmers of Pennsylvania are to have a big share in the Annual Summer Farmers' Week of the Pennsylvania State College. This program will begin two days ahead of the general program and continue until Friday. The dates are June 20th to 24th, inclusive. The first formal meeting will be a big get together and get acquainted program Monday evening.

Free sleeping quarters will be provided for the young people in the college dormitories. The entire main building, which will accommodate several hundred has been turned over to the boys for the week, and the girls will be very comfortably quartered in one of the girls' cottages on the campus. Board at reasonable rates will be available in college boarding clubs.

Team from Newfoundland, Wayne Co., Pa., Vocational School, winner of the Holstein-Friesian Association's silver trophy, at the 1920 Young Farmer's Week. This was Pennsylvania's team at the National Dairy Show, Chicago, October, 1920. Left to right—R. E. Wakely, County Agent; Rush Simonds, Ross Osborne, Friend Uhl, J. J. Jacobs, vocational supervisor.

The program is to be a happy combination of instruction, judging practice and recreation. The members of the college teaching and extension staffs will be in charge of the instructional work. In the contests and recreational programs they will be assisted by supervisors of agriculture from the Bureau of Vocational Education. The athletic program will include baseball, tennis and a variety of organized games that are suited to the open country.

In order to facilitate the work and make it possible for those who attend to concentrate on the things in which they are most interested there will be four groups for instruction and to students taking work in vocational agriculture in vocational schools or departments, but enrollment is not limited in any way. Any boy or girl who is interested in better agriculture is cordially invited to enroll. In order to be eligible to enter the judging contests on Thursday, one must have judged in a contest previously, but this requirement can be met in connection with the judging work on the preceding days of the program.

A special invitation is extended to all vocational directors and supervisors, and local club leaders, to be present. Accommodations will be provided in the dormitories the same

as for the young farmers or if it is desired room and board will be secured in a fraternity house at reasonable rates. There will be much worth-while for all leaders in the program of Tuesday and Wednesday.

Dean Watts and everyone in the School of Agriculture consider it an honor to act as hosts to the Young Farmers of the Keystone State. They want to get acquainted with the State's future farmers. The acquaintances that will be formed with the college staff and with young farmers from other counties comprise a large part of the real value of the trip.

Prospects now are bright for the biggest and best Young Farmer's Week the College has ever had. On Monday, June 20th, all roads will lead to Penn State.

LETTERS FROM THE BOYS

Dear Editor—I have read the Boys' Page very often and think it very good. You sure have a lot of letters from the boys. I live on a farm of 52 acres. We have two horses, one cow, 60 chickens and a dog. We have about a 150 little chicks.

I was born in Missouri. We moved to Pennsylvania when I was eight years old. Our school closed May 6th. Our teacher's name was Miss Craig and the name of our school is Point Pleasant. There are 25 pupils who go to our school. I have two sisters and one brother. One sister is at home and the other one is in Missouri. One is in the eighth grade in school and hopes to get to high school next year. We built a fence yesterday afternoon. Our horses' names are Betty and Jeff. One is a roan and the other one is a black horse.

S. R. Snyder has a pretty good idea about a pigeon house. I think I will try his way as we have about 20 pigeons about our place.

Can anybody tell me how to keep the crows away? I am getting a new stock of chickens; we did have Plymouth Rocks but now we have the white Leghorns. I have a little pet hen and she is looking in at me now. I have not missed a day of school for two years. Our school is about a mile from my home.—Robert L. McCartney, Beaver Co., Pa.

Profit, Not Prophet

A colored gentleman named Joshua Johnson was arrested for making whisky. When his case was called the judge jokingly asked him if he was any relation to the Joshua that made the sun stand still.

"No, sah," replied Joshua. "I see no 'lation to dat guy, but I see the real and 'riginal Joshua that made de moonshine."

Waste not—want not.

The Valley of the Giants

By PETER B. KYNE

Chapter IV

Synopsis—John Cardigan, a middle-aged man—a plant in frame and mind—was a pioneer settler along the Pacific coast in Humboldt County, California, in 1850. His business was cutting the giant trees into lumber. His young wife died and was buried among the redwoods in "The Valley of the Giants," as he called the spot which he loved and reserved as a shrine to her memory. Bryce, Cardigan's only son, was an intimate friend of his father—who planned that he should inherit the great lumber business which he had built up. Bryce had a brief love affair with Shirley Sumner, a visitor to the neighborhood, but she was soon forgotten. Cardigan tried to buy a tract of timber adjoining his and refused to be bluffed into raising his offer for it. He determined to move his mill to the San Hedrin watershed and start logging operations there.

BRYCE pondered. "But isn't it cheaper to give him his price on Squaw Creek timber than to go logging in the San Hedrin and have to build twenty miles of logging railroad to get your logs to the mill?"

"It would be, son, if I had to build the railroad. Fortunately, I do not. I'll just shoot the logs down the hillside to the San Hedrin River and drive them down the stream to a log-boom on tidewater."

"But there isn't enough water in the San Hedrin to float a redwood log, Dad. I've fished there, and I know."

"Quite true—in the summer and fall. But when the winter freshets come on and the snow begins to melt in the spring up in the Yola Bolas, where the San Hedrin has its source, we'll have plenty of water for driving the river. Once we get the logs down to tidewater, we'll raft them and tow them up to the mill. So you see, Bryce, we won't be bothered with the expense of maintaining a logging railroad, as at present."

Bryce looked at his father admiringly. "I guess Dan Keyes is right, Dad," he said. "Dan says you're crazy—like a fox. Now I know why you've been picking up claims in the San Hedrin watershed."

"No, you don't, Bryce. I've never told you, but I'll tell you now the real reason. Humboldt County has no rail connection with the outside world, so we are forced to ship our lumber by water. But some day a railroad will be built in from the south—from San Francisco; and when it comes, the only route for it to travel is thru our timber in the San Hedrin Valley. I've accumulated that ten thousand acres for you, my son, for the railroad will never be built in my day. It may come in yours, but I have grown weary waiting for it, and now that my hand is forced, I'm going to start logging there. It doesn't matter, son. You will still be logging there fifty years from now. And when the railroad people come to you for a right of way, my boy, give it to them. Don't charge them a cent. It has always been my policy to encourage the development of this county, and I want you to be a forward-looking, public-spirited citizen. That's why I'm sending you East to college. You've been born and raised in this town, and you must see more of the world. You mustn't be narrow or provincial, because I'm saving up for you, my son, a great many responsibilities, and I want to educate you to meet them bravely and sensibly."

He paused, regarding the boy gravely and tenderly. "Bryce, lad," he said presently, "do you ever wonder why I work so hard and barely manage to spare the time to go camping with you in vacation time?"

"Why don't you take it easy, Dad?"

You do work awfully hard, and I have wondered about it."

"I have to work hard, my son, because I started something a long time ago, when work was fun. And now I can't let go. I employ too many people who are dependent on me for their bread and butter. When they plan a marriage or the building of a home or the purchase of a cottage organ, they have to figure me in on the proposition. I didn't have a name for the part I played in these people's lives until the other night when I was helping you with your algebra. I'm the unknown quantity."

"Oh, no," Bryce protested. "You're the known quantity."

Cardigan smiled. "Well, maybe I am," he admitted. "I've always tried to be. And if I have succeeded, then you're the unknown quantity, Bryce, because some day you'll have to take my place; they will have to depend upon you when I am gone. Listen to me, son. You're only a boy, and you can't understand everything I tell you now, but I want you to remember what I tell you, and some

The Old Songs

These ragtime songs they are singing now
May be the proper thing,
But they don't appeal to me like the songs
Which our child folk used to sing.

I never hear the ragtime song,
No matter where I roam.
That makes my heartstrings quiver
Like "My Old Kentucky Home."

"Lorena" was another song
That all our heartstrings wrung,
Around at social gatherings,
When all us folks were young.

We'd "Wait for the Wagon,"
And we'd tell of "Nellie Gray,"
And "Old Susannah" got her turn,
And likewise "Old Dog Tray."

And "Massa's in the Cold Ground";
We'd sing that by the hour

Then, feeling sad, we'd finish with
"A Little Faded Flower."

These are the songs that round our hearts
The spell of music flung,
These are the songs the people sang
When us old folk were young.

We knew some operatic songs
As well as these, be'gee;
"The Heart Bowed Down," like-wise its mate,
"Then You'll Remember Me."

And when we tired of opera,
The simpler things we'd try,
And make the rafters fairly ring with
"Comin' Thru the Rye!"

Oh, you can have your ragtime songs;
Give me the songs they sung
Around at social gatherings
When us old folk were young.

—J. J. T.

day understanding will come to you. You mustn't fail the people who work for you—who are dependent upon your strength and brains and enterprises to furnish them with an opportunity for life, liberty, and the pursuit of happiness. When you are the boss of Cardigan's mill, you must keep the wheels turning; you must never shut down the mill or the logging-camps in dull times just to avoid a loss you can stand better than your employees."

His hand, trembling old hand closed over the boy's. "I want you to be a brave and honorable man," he concluded.

True to his word, when John Cardigan finished his logging in his old, original holdings adjacent to Sequoia and Bill Henderson's Squaw Creek timber, he quietly moved south with his Squaw Creek woods-gang and joined the crew already getting out logs in the San Hedrin watershed. Not until then did Bill Henderson realize that John Cardigan had called his bluff—whereat he cursed himself for a fool and a poor judge of human nature. He had tried a hold-up game and had failed; a dol-

lumpage and paid for it with a certified check. With his check in his hand, Henderson queried:

"Colonel, how do you purpose logging that timber?"

The Colonel smiled. "Oh, I don't intend to log it. When I log timber, it has to be more accessible. I'm just going to hold on and outgame your former prospect, John Cardigan. He needs that timber; he has to have it—and one of these days he'll pay me two dollars for it."

Bill Henderson raised an admonitory finger and shook it under the Colonel's nose. "Hear me, stranger," he warned. "When you know John Cardigan as well as I do, you'll change your tune. He doesn't bluff."

"He doesn't?" The Colonel laughed derisively. "Why, that move of his over to the San Hedrin was the most monumental bluff ever pulled off in this country."

"All right, sir. You wait and see." "I've seen already. I know."

"How do you know?"

"Well, for one thing, Henderson, I noticed Cardigan has carefully housed his rolling-stock—and he

hasn't scrapped his five miles of logging railroad and three miles of spurs."

Old Bill Henderson chewed his quid of tobacco reflectively and spat at a crack in the sidewalk. "No," he replied, "I'll admit he ain't started scrapin' it yet, but I happen to know he's sold the rollin'-stock an' rails to the Freshwater Lumber Company, so I reckon they'll be scrapin' that railroad for him before long."

The Colonel was visibly moved. "If your information is authentic," he said slowly, "I suppose I'll have to build a mill on tidewater and log the timber."

"Twon't pay you to do that at the present price of redwood lumber."

"I'm in no hurry. I can wait for better times."

"Well, when better times arrive, you'll find that John Cardigan owns the only waterfront property on this side of the bay where the water's deep enough to let a ship lie at low tide and load in safety."

"There is deep water across the bay and plenty of water-front property for sale. I'll find a mill-site there and tow my logs across."

"But you've got to dump 'em in the water on this side. Everything north of Cardigan's mill is tide-flat; he owns all the deep-water frontage for a mile south of Sequoia, and after that come more tide-flats. If you dump your logs on these tide-flats, they'll bog down in the mud, and there isn't water enough at high tide to float 'em off or let a tug go in an' snake 'em off."

"You're a discouraging sort of person," the Colonel declared irritably. "I suppose you'll tell me now that I can't log my timber without permission from Cardigan."

Old Bill spat at another crack; his faded blue eyes twinkled mischievously. "No, that's where you've got the bulge on John, Colonel. You can build a logging railroad from the southern fringe of your timber north and up a ten cent grade on the far side of the Squaw Creek watershed, then west three miles around a spur of low hills, and then south eleven miles thru the level country along the bay shore. If you want to reduce your Squaw Grade to say two per cent, figure on ten additional miles of railroad and a couple extra locomotives. You understand, of course, Colonel, that no locomotive can haul a long trainload of redwood logs up a long, crooked, two per cent grade. You have to have an extry in back to push."

"Nonsense! I'll build my road from Squaw Creek gulch south thru that valley where those whopping big trees grow. That's the natural outlet for the timber."

"But that valley ain't logged yet," explained Henderson.

"Don't worry. Cardigan will sell that valley to me—also a right of way down his old railroad grade and thru his logged-over lands to tidewater."

"Bet you a chaw o' tobacco he won't. Those big trees in that valley ain't goin' to be cut for no railroad right o' way. That valley's John Cardigan's private park; his wife's buried up there. Why, Colonel, that's the biggest grove of the biggest sequoia sempervirens in the world, an' many's the time I've heard John say he'd almost as lief cut his right hand as fell one o' his giants, as he calls 'em. I tell you, Colonel John Cardigan's mighty peculiar about them big trees. Any time he

can get a day off he goes up an' looks 'em over."

"But, my very dear sir," the Colonel protested, "if the man will not listen to reason, the courts will make him. I can condemn a right of way, you know."

"We'll," said old Bill, wagging his head sagely, "mebbe you can, an' then again mebbe you can't. It took me a long time to figger out just where I stood, but mebbe you're quicker at figgers than I am. Anyhow, Colonel, good luck to you, whichever way the cat jumps."

This illuminating conversation had one effect on Colonel Seth Pennington. It decided him to make haste slowly; so without taking the trouble to make the acquaintance of John Cardigan, he returned to Detroit, there to await the next move in this gigantic game of chess.

Chapter V

No man is infallible, and in planning his logging operations in the San Hedrin watershed, John Cardigan presently made the discovery that he had erred in judgment. That season, from May to November, his woods-crew put thirty million feet of logs into the San Hedrin River, while the mill sawed on a reserve supply of logs taken from the last of the old choppings adjacent to Squaw Creek. That year, however, the rainfall in the San Hedrin country was fifty per cent less than normal, and by the first of May of the following year Cardigan's woods-crew had succeeded in driving slightly less than half of the cut of the preceding year to the boom on tidewater at the mouth of the river.

"Unless the Lord'll gi' us a lot more water in the river," the woods-boss McTavish complained, "I dinna see how I'm to keep the mill runnin'." He was taking John Cardigan up the river bank and explaining the situation. "The heavy butt-logs hae sunk to the bottom," he continued. "We a normal head o' water, the lads'll move them, but wi' the wee drapple we have the noo—" He threw up his hamlike hands despairingly.

Three days later a cloud-burst filled the river to the brim; it came at night and swept the river clean of Cardigan's clef logs. An army of Juggernauts, they swept down on the boiling torrent to tidewater, reaching the bay shortly after the tide had commenced to ebb.

Now, a chain is only as strong as its weakest link, and a log-boom is a chaplet of small logs, linked end to end by means of short chains; hence when the vanguard of logs on lip of that flood reached the log-boom, the impetus of the charge was too great to be resisted. Straight thru the weakest link in this boom the huge saw-logs crashed and out over Humboldt Bar to the broad Pacific. With the ebb tide some of them came back, while others, caught in cross-currents, bobbed about the Bay all night and finally beached at widely scattered points. Out of the fifteen million feet of logs less than three million feet were salvaged, and this task in itself was an expensive operation.

John Cardigan received the news calmly. "Thank God we don't have a cloud-burst more than once in ten years," he remarked to his manager. "However, that is often enough, considering the high cost of this one. Those logs were worth eight dollars a thousand feet, board measure, in the millpond, and I suppose we've lost a hundred thousand dollars' worth."

He turned from the manager and walked away thru the drying yard, up the main street in Sequoia, and on into the second-growth timber at the edge of the town. Presently he emerged on the old, decaying skid-road and continued on thru his logged-over lands, across the little divide and down into the quarter-section of green timber he had told McTavish not to cut. Once in the Valley of the Giants, he followed a well-worn foot-path to the little amphitheatre, and where the sunlight filtered thru like a halo and fell on a plain little white marble monument, he paused and sat down on the now almost decayed sugar-pine windfall.

"I've come for a little comfort, sweetheart," he murmured to her who slept beneath the stone. Then he leaned back against a redwood tree, removed his hat, and closed his eyes, holding his great gray head the while a little to one side in a listening attitude. Long he sat there, a great, time-bitten devotee at the shrine of his comfort; and presently the barred look left his strong, kind face and was replaced by a little prescient smile—the sort of smile worn by one who thru bitter years has sought something very, very precious and has at length discovered it.

Chapter VI

It was on the day that John Cardigan received the telegram from Bryce saying that, following four years at Princeton and two years of travel abroad, he was returning to Sequoia to take over his redwood heritage—that he discovered that a stranger and not the flesh of his flesh and the blood of his blood was to reap the reward of his fifty years of endeavor. Small wonder, then, that he laid his leonine head upon his desk and wept, silently, as the aged and helpless weep.

For a long time he sat there lethargic with misery. Eventually he roused himself, reached for the desk telephone, and pressed a button on the office exchange-station. His manager, one Thomas Sinclair, answered.

"Thomas," he said calmly, "you know, of course, that Bryce is coming home. Tell George to take the big car and go over to Red Bluff for him."

"I'll attend to it, Mr. Cardigan. Anything else?"

"Yes, but I'll wait till Bryce gets home."

George Sea Otter, son of Bryce Cardigan's old half-breed nurse, was a person in whose nature struggled the white man's predilection for advertisement and civic pride and the red man's instinct for adornment. For three years he had been old man Cardigan's chauffeur and man-of-all-work about the latter's old-fashioned home, and in the former capacity he drove John Cardigan's single evidence of extravagance—a Napier car, which was very justly regarded by George Sea Otter as the king of automobiles, since it was the only imported car in the county. Upon receipt of orders, therefore, from Sinclair, to drive the Napier over to Red Bluff and meet his future boss and one-time play-fellow, George Sea Otter arrayed himself in a pair of new black corduroy trousers, yellow button shoes, a blue woolen shirt with a large scarlet silk handkerchief tied around the neck, a pair of beaded buckskin gloves with fringe dependent from the gauntlet, and a should worry all the time when you were riding him. We don't want our little boy to get hurt."

shield of the Napier he fastened an orange-colored pennant bearing in bright green letters the legend: "My City—Sequoia." As a safety-first precaution against man and beast enroute, he buckled a gun-scabbard to the spare tires on the running-board and slipped a rifle into the scabbard within quick and easy reach of his hand; and, arrayed thus, George descended upon Red Bluff at the helm of the king of automobiles.

When the overland train coasted into Red Bluff and slid to a grinding halt, Bryce Cardigan saw that the Highest Living Authority had descended from the train also. He had elected to designate her thus in the absence of any information anent her Christian and family names, and for the further reason that quite obviously she was a very superior person. He had a vague suspicion that she was the kind of girl in whose presence a man always feels that he must appear on parade—one of those alert, highly intelligent young women so extremely apt to reduce an ordinarily intelligent young man to a state of gibbering idiocy or stupid immobility.

Bryce had traveled in the same car with the Highest Living Authority from Chicago and had made up his mind by observation that with a little encouragement she could be induced to mount a soap-box and make a speech about Women's Rights; that when her native state should be granted equal suffrage she would run for office or manage somebody's political campaign; that she could drive an automobile and had probably been arrested for speeding; that she could go around any golf links in the country in ninety and had read Mac-

terlinck and enjoyed it.

Bryce could see that she was the little daughter of some large rich man. The sparsity of jewelry and the rich simplicity of her attire proved that, and moreover she was accompanied by a French maid to whom she spoke French in a manner which testified that before acquiring the French maid she had been in the custody of a French nurse. She possessed poise. For the rest, she had wonderful jet-black hair, violet eyes, and milk-white skin, a correct nose but a somewhat generous mouth. Bryce guessed she was twenty or twenty-one years old and that she had a temper susceptible of being aroused. On the whole, she was rather wonderful but not dazzling—at least, not to Bryce Cardigan. He told himself she merely interested him as a type—whatever he meant by that.

The fact that this remarkable young woman had also left the train at Red Bluff further interested him, for he knew Red Bluff and while giving due credit to the many lovely damsels of that ambitious little city, Bryce had a suspicion that no former Red Bluff girl would dare to invade the old home town with a French maid. He noted, as further evidence of the correctness of his assumption, that the youthful baggage-smasher at the station failed to recognize her and was evidently dazzled when, followed by the maid struggling with two suit-cases, she approached him and in pure though alien English (the Italian A predominated) inquired the name and location of the best hotel and the hour and point of departure of the automobile stage for San Hedrin. (Continued Next Week.)

A Story for Children

How Mickey Got His Pony

Is there any boy or girl who would not like to have a pony? I don't believe there is, and Mickey Farren was a little boy who wanted a pony more than anything else in the whole world.

Mickey

Mickey winked back the tears and turned away, saying "I-I guess I could manage a great big horse, I could."

That same summer, Mickey's parents had to go away, and Mickey was sent to his grandfather's place in the country. When he would write to his father he hinted that he was doing wonderful things, but he did not tell all.

When the summer was almost over, Mickey's parents came to the farm, too. The night they arrived, Mickey said, "I am going to show you something after supper." And he was so excited he could hardly eat. He and grandfather seemed to have a great secret and every once in a while exchanged winks.

After supper Mickey disappeared. All the folks gathered on the front porch for an evening chat. Pretty soon someone said "Look!"

Trotting down the lane was little Mickey on a big black horse. As he came nearer, he made the horse gallop and went sailing by the house with a yell. Mr. and Mrs. Farren were so surprised that they couldn't say one word. Mickey came up to the porch and slid from the horse's back. Running up to his father, he said with a mischievous grin.

"Father now may I have a pony? I can manage a great big horse. Don't you think I could manage a pony?"

What could father do after that? Well, Mickey got his dreamed-of pony, and father was mighty proud of his son.—L. M. K.

Veterinary

Conducted by W. C. Fair, V. S.

Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Inquiries only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, make one of the most valuable medical symposiums a farmer-stockman can obtain.

Sore Neck.—This is the third year

that my black horse has been troubled with sore neck. Have applied salve to top of neck, but it fails to help him. M. C. D., Boalsburg, Pa. Clip off mane, wash the skin with soap and water and be sure that collar fits. Dissolve 1 oz. acetate of lead, 6 drams sulfate of zinc, 1 dram tannic acid in one quart of cold water and apply to upper part of neck three times a day.

Jaundice Icterus.—I have a mare 15 years old, which has been under the doctor's care for a week. He tells me she has a diseased liver. The white part of eyes are yellow. During her illness she spit up about 3 quarts of frothy water and her bowels were constipated. Her kidney action was faulty and irregular. When standing she kept hind legs well under body and was inclined to sit on her haunches. Her bowels are now active, but her kidneys do not act free. I forgot to mention, she has heaves. What shall I do for her? C. A. S., Elmira, N. Y.

Jaundice Icterus is a serious and not a disease, and may be due to a variety of conditions, but we meet with obstructive jaundice, malignant jaundice and jaundice of the newborn foal. Give her 15 grains of calomel and one ounce of bicarbonate of soda at a dose twice a day for a few days. Are you sure she is not foundered, if so stand her four feet in wet clay three hours a day.

Vertigo.—Partial Paralysis.—Several horses in this locality have been affected peculiarly, most of the sick ones have died. The attack comes on suddenly, the animal will be going along as usual and suddenly pitches forward, falls to the ground and is unable to get up, breathes very hard and hurriedly, pants as if in pain, points nose to side, kicks some, water coffee colored mares seem to be more prone to this ailment than geldings. Most of the animals are on adjoining farms. Have not heard of any mules having this sickness. I have been a reader of the Pennsylvania Farmer for 12 years. W. W., Clearville, Pa. The food and water supply should be investigated, besides an examination of the manure would be interesting. If possible ascertain the cause, then remove it. If the bowels are constipated give single dose of cathartic medicine. Give one dram fluidextract of nuxvomica and 30 grains of potassium iodide 3 times a day. Apply mustard and water to back three times a week. I would suggest a change of feed and water.

Bleeding Wart.—Tumor.—I have a cow with swelling under tail, noticed like a bleeding wart. First noticed it the size of a door knob, situated between vulva and anus. H. L., Williamstown, N. Y. Either cut, or twist or tie off bunch, then apply the following lotion twice daily—1 oz. acetate of lead and 4 oz. tannic acid dissolved in one quart of cold water. Failure to Come in Heat.—I have a cow 5 years old that has had 3 calves, last calf in May, 1920, since then she has failed to come in heat. J. L. Muncey Valley, Pa. She should be examined by veterinarian or trained dairymaid to ascertain why she fails to come in heat. Give her six grains of ground nuxvomica and a teaspoonful of capsicum at dose in feed twice daily.

Light Milker.—I have a cow that freshened last fall, since then she has milked fairly well, but for 30 days she has grown thin and gives only one quart of milk at a milking. No bunches in udder but milk is thick. L. D. M., West Newton, Pa. She is an unprofitable dairy cow and always will be, therefore you should dry her and as soon as fleshy market her to butcher.

Second Annual Guaranty Sale

Oneida County Holstein Club

In Combination with Herkimer County

Breeders on the Francis M. Jones Farm,

CLINTON, New York

June 7 and 8—Two Big Days

A sixty-day guaranty sale of selected individuals chosen by an inspection committee appointed by the Club

THE ENTIRE A. C. HOWE HERD will be a leading feature. In this extraordinary herd are 18 direct descendants of the 42-lb. cow, Tietje Queen De Kol, including her 30-lb. 2-year-old, Glen Alex Tweede De Kol with the latter's yearling daughter and a last November son sired by Spring Farm King. Glen Alex King Tweede, a full brother to this youngster, has 8 daughters and 3 sons in the herd.

A 2-year-old daughter of Champion Echo Sylvia Poulk from the 43-lb. 4-year-old, Tietje Queen De Kol 2d, is one of the outstanding entries in this consignment. Her daughter is likewise included and so a last September son of the 43-lb. 4-yr.-old, sired by Glen Alex King Tweede.

LAST YEAR'S SALE established a high standard of quality. The coming event, it is believed, will be even better. An earnest effort is being put forth to make this a sale that shall be fairly representative of the best that Oneida and Herkimer counties can produce in good Holsteins.

ELECTRIC CARS from Utica will be met at Clinton

COUNTY NOTES

Wyoming Co., Pa.—Weather has been very fine most of the spring and season seems to be about two weeks earlier than usual. Some oats still to sow in localities where it has been very wet. April freezes damaged the fruit somewhat yet there seems to be more peaches than for some years back. Prospects are good for hay and oats. The labor situation is easier than last year, although wages are rather high in proportion to prices of farm products.

The long looked for Dairymen's League co-operative pooling plan began to function May first. It is a big undertaking and will no doubt disclose some weak places and probably need some corrections and changes but we feel sure it is a start in the right direction.

Farmers are awakening to the fact that they must do more than to simply produce more without any regard to whether or not they get cost of production. Also they are learning that they can organize and stick together when necessary and work for their own interests.—P. A. Valentine.

Washington Co., Pa.—Farmers are pretty well up with work, although the many rains of last ten days have kept many from planting corn. Oats are doing nicely and wheat is thickening up fast where there was any at all to stool. Some reports of fly damage. Pasture is good and meadows promise well but the next 30 days may change the outlook entirely. Some yellow spots in meadows, the result of cut worms and wire worms. Prices of farm products lower, but labor holds out for same old wage or more, and shorter hours. Their position is untenable and sooner or later they must give in or the non-unionists, a great majority, will in anger and disgust use a union weapon, boycott. Wool buyers get a few clips at 33 cents, but get orders to quit. Butter down to 35c, eggs stamped to 20c but are 25c now. A number of tractors sold in county this spring.—Bruce McNinch.

Carroll County, Md.—The orchard fruits are nearly all wiped out. Some few apples of late varieties are scattered here and there over the trees. The small fruits were not hurt. The prospects are for a large crop of strawberries. Currants, blackberries and raspberries appear to be normal. Wheat and oats are looking good. Most of the farmers have finished planting corn. A hard rain passed over the lower part of county washing corn fields badly. Pastures are on the whole in good condition. Potatoes, which were planted early, are a poor stand, a large number either failed to sprout or are dormant. Wheat is quoted at \$1.35 bu.; potatoes selling for 25c bu. Eggs are selling for 21c doz., while chickens, that is, old hens, are bringing 28¢ @ 30c pound; young chickens are bringing 40c lb. Calves are selling at 7¢ @ 8 cents a pound, hogs 9¢ pound while pork is selling for 25¢ pound. There is an over-supply of butter, prices ranging from 15 to 25¢ pound.—Harry I. Rinehart.

Mifflin Co., Pa.—Weather cool, a few wet spells which were bad for the corn that was planted but it is coming up. Lots more corn to plant yet. Wheat is looking well; grass not doing as well as some times. Some insect is destroying the clover in some fields. Some farmers have finished planting potatoes.—J. H. B.

Read What "Hard Drivers" Write of Essex Reliability

They say that under severest service the Essex stays solid, tight, and free of noises, with little or no repair outlay.

And note their economy experience. Some have owned six, eight, or more cars previously.

Their next car will also be an Essex. They say that.

The Essex does not grow old, because it is rigidly built. Adjustments are provided to take up wear. Thus it is always firm, quiet, smooth and easy riding.

Your dealer will gladly explain wherein Essex duplicates costly car construction.

"I cannot imagine more abusive service—than I have given my Essex in 15,000 miles of prospecting work, in virgin, rocky country. Running as well today as when I got it. Two other cars in the same kind of service are 'shot'."

G. G. SAWTELLE, Pawhuska, Okla.

"Have driven my Essex 16,400 miles. Had driven eight different makes of light cars, and none would last me a season. I drive a car hard—bad roads, all weather. Upkeep has been practically nothing. Its remarkable performance and the satisfaction it has given has led to many more Essex sales as I believe I have been instrumental in selling more Essex cars than any of your salesmen. I have never been bothered with squeaks or rattles."

A. I. BRUETT, A. I. Bruett Piano Co., Milwaukee

"Drove Essex 20,354 miles in 7 months. Gas consumption averaged 19 miles to the gallon. Twenty-four gallons of oil were used. No repairs whatever were made during this period, and the engine was not cleaned until approximately 12,000 miles had been covered."

"I have driven cars for the last 6 or 7 years. Cars, with me, have to do exceptionally heavy service, and this year will be the first I have ever used the same car for the second season, as I am doing with my Essex."

"My work as a travelling salesman, necessitates covering four Canadian provinces. Part of my way lies through the Metepedia Valley; the roads are so narrow that it is necessary before starting to remove the windshield and top and to bandage the body and mud-guards with heavy cotton in order to keep the finish from being destroyed by the branches and bushes at the sides of the roads."

"Naturally it would be hard to sell me anything but an Essex in the future—not only for endurance, but for get-away, 'pep' and all around performance."

Rural Community Vocational Schools

Brief Description of What is Being Accomplished in Some of These Schools—By R. P. Kester

COMPARATIVELY few people out of the total population of the State are acquainted with the workings and the possibilities of vocational schools. If all school boards and parents of children could see such a school in operation and become personally acquainted with the kind of work the pupils do and see the progress they make, the demand for these schools would quickly swamp the Department of Public Instruction.

The Honey Brook, Chester County, Pa., Vocational School

It was the writer's privilege a short time ago to accept an invitation from Prof. L. H. Dennis, Director of Vocational Training in Pennsylvania, to make a tour with him and others visiting some of these schools in three counties. The visits were confined to Rural Community Vocational Schools, as those established in strictly rural communities or rural communities in co-operation with small boroughs are called. Many cities and boroughs have had Vocational Schools for some time, and while they are of equal value and interest it is in the schools which serve rural people we have greatest interest.

The first school visited was the one at Honey Brook, Chester County. This fine school was made possible by the co-operation of the borough of Honey Brook and Honey Brook Township. Previous to its establishment five years ago each supported a third-class, two-year high school in two buildings within a stone's throw of each other. This unsatisfactory condition led to the joint erection of the splendid building shown herewith. The grounds contain five acres and the whole is being developed into a beautiful as well as practical institution. Seven districts send pupils to the school which is composed of the seventh and eighth grades. All the pupils are receiving vocational training in addition to their academic courses. Twenty are studying and practicing agriculture.

The building contains a model kitchen, dining room, bed room and bath room and the girls are taught all the duties connected with the care and furnishing of them. The visitors thoroly enjoyed the splendid meal prepared by the girls that day. It reflected great credit to teacher and pupils alike. No part of the work of the school is more enjoyed by the pupils than that done in the shops. The practical work done in the wood-working and iron-working shops develops characteristics in the pupils which no amount of book learning alone could do. The teachers in this school deserve great credit for the work accomplished.

The next visit made was to the West Lampeter School, Lancaster County. Here, in one of the finest farming sections of Pennsylvania is one of the finest rural schools in the state. It is but due, in passing, to mention the undeviating loyalty of the most unusual school board in this district. Even in the face of the original opposition these men persisted in the development of

such a school as they felt should be established. Their success now brings them the deserved praise of their fellowmen. But one change in the personnel of the board has occurred in 16 years and that was occasioned by a member moving out of the district.

The pictures shown herewith will give some idea of the splendid building in which the school is housed; also the work and equipment of some of the departments. The high school was established ten years ago in which an abridged course in home economics was included. Five years ago a large addition was built and the school converted into a vocational school with a four-year high school course. There are 116 pupils enrolled, some of them coming long distances. The teachers are a live, capable bunch and are full of the right kind of enthusiasm. Special mention should be made of the unusual musical training pursued; two full-fledged orchestras are maintaining systematic instruction in scientific practices; and by developing skill in such handicraft as an experienced farmer would need. The purpose of homemaking education in secondary schools is to train for homemaking thru the actual performance of activities in the home. The courses are planned so as to enable the girls of 14 years of age or over to actually manage certain phases of the work in the home. They also aim to help develop in the girls a sense of their social responsibilities in the home, the school and the community.

West Lampeter Vocational School, Lancaster County, Pennsylvania

County, thirty miles back from the main line of the Pennsylvania and at the end of a one-horse railroad is Blain Vocational School. It is of a different type from the other two described above and yet it is most interesting because it shows what can be done in sections not so favorably situated as those first mentioned. The population is sparse and scattered, yet the accomplishments achieved during the few years this school has been established promise to revolutionize that entire section. No longer is it necessary for the young people to go away from home for education and entertainment, and what is more they are learning to appreciate the opportunities at home because they are becoming efficient farmers and homemakers. The work which the boys and girls are

doing in this school will compare favorably with that done in any other.

For financial reasons it was necessary to start this school in three separate buildings. Plans are laid for a new building sometime in the future, but at present an old school building is used for the academic courses, a new one-story building was erected for agriculture and wood working, and a dwelling house was bought and converted into a home-economics building. Blacksmithing is taught in still another building, the instructor being the village blacksmith and a most interested director. Every department seemed to be doing splendid work under inspiring teachers. The splendid dinner prepared and served by the girls in the home-making department proves them capable of making happy homes for somebody in the future.

General Information

The following information about vocational schools is furnished by the Department of Public Instruction:

The purpose of vocational education is to train for useful and profitable employment. The purpose of agricultural education in secondary school is to train pupils 14 years of age or over who have decided to follow some branch of farming. This purpose is accomplished by acquainting pupils with the vast store of agricultural knowledge and the methods of farming; by giving systematic instruction in scientific practices; and by developing skill in such handicraft as an experienced farmer would need.

The purpose of homemaking education in secondary schools is to train for homemaking thru the actual performance of activities in the home. The courses are planned so as to enable the girls of 14 years of age or over to actually manage certain phases of the work in the home. They also aim to help develop in the girls a sense of their social responsibilities in the home, the school and the community.

The instruction in both agriculture and homemaking is made sound and practicable by having each student carry on a project in the home or on the home farm. In conducting a home project the boy or girl proceeds thru the several steps. The pupils in agriculture select a type of project such as corn or potato growing, or poultry, pig or calf raising. The pupils in homemaking select such projects as the planning and serving of meals, the preservation of foods, or taking care of the family mending. All the information possible about the

Lunch Time at West Lampeter Vocational School, Lancaster Co., Pa. Lunch is Prepared by the Junior Home-making Girls (in uniform)

project is then acquired by reading and inquiring of successful farmers and home-makers. A plan of just what will be done at each stage of the project is made. The work is then done, keeping accounts meanwhile of all the business features of the project. Finally a report is made—lessons from practices and methods which proved successful are drawn, and the faults in methods which were unsuccessful pointed out. The home project is of value because it uses the school knowledge for actual production on the farm, or in the farm home, definitely tying up theory and practice. It is knowledge successfully applied; it is learning by doing.

Types of Schools

Instruction of this kind is provided in Pennsylvania in three types of public high schools. All are under the direct control of local boards of school directors. The difference between these schools and the regular high school, not providing vocational courses, is that the State and Federal Governments provide additional funds for vocational instruction. The types of schools just referred to are as follows:

- 1—Rural Community Vocational Schools.
- 2—Vocational Departments in High Schools.
- 3—Local schools for instruction by county vocational supervisors.

Rural Community Vocational School

These schools are located at centers in the community and serve the distinctly rural population. Vocational work is offered for both boys and girls. They are called vocational schools because all pupils enrolling in them for instruction enter either the agricultural or home-making course for two years. In these first two years, the pupils spend one-half of each day in academic studies, such as English, civics, history or science, and the other half day on vocational studies, such as farm crops, animal husbandry, poultry or farm shop for the boys, and cooking, dressmaking, household accounts or home nursing for the girls. During the last two years of the high school course the pupil may elect the full academic course or may continue the former schedule with more advanced vocational work. The growth in the number of these schools has not been spectacular but it has been steady, as is indicated by the following record.

Year.	Schools.	Boys.	Girls.	Tl.
1916-17	17	795	531	1236
1917-18	23	852	775	1627
1918-19	23	716	717	1433
1919-20	28	847	1045	1892
1920-21	37	1030	1370	2400

During these five years no vocational school has been discontinued. Instead each has grown very rapidly. After being changed from a small high school to a vocational school, the increase in enrollment has been quite marked.

Many more requests have been received each year from school boards for permission to organize Rural Community Vocational Schools than could possibly be granted by the State Department of Public Instruction. Many districts are planning to organize vocational schools in the near future in connection with the consolidation of their schools.

Rural Community Vocational Schools 1920-1921

Adams Co., Arden; Allegheny Co., Imperial and Liberty; Armstrong Co., Dayton; Beaver Co., Darlington; Berks Co., Leesport; Blair Co., Martinsburg; Bradford Co., New Albany; Butler Co., West Sunbury; Center Co., Spring Mills; Chester Co., Avondale, Cochransville and Honey Brook; Columbia Co., Benton; Crawford Co., Conneautville, Spartansburg and Townsville; Dauphin Co., Berksburg; Delaware Co., Broomall; Erie Co., Waterford; Huntingdon Co., Petersburg; Indiana Co., Elders Ridge; Jefferson

Co., Beechwoods and Corsica; Lancaster Co., Lampeter and Reamstown; Lawrence Co., New Wilmington; Luzerne Co., Trucksville; Lycoming Co., Picture Rocks; Mercer Co., Fredonia; Mifflin Co., Belleville; Perry Co., Blain; Schuylkill Co., Reinerton; Susquehanna Co., Harford and Dimock; Wayne Co., Ariel and Newfoundland; Washington Co., Centerville and Hickory; Wyoming Co., Mill City.

Interesting Facts Relative to Vocational Schools

Number of Districts Operating Vocational

Wood Working Shop in Honey Brook School

Schools 1919-20: 17 schools operated by one district each; 8 schools operated by two districts each; 2 schools operated by three districts each; 1 school operated by four districts each. Total—28 schools operated by 43 districts.

Made by the Boys of the Blain School

Note—Where two or more districts form a joint board to operate a vocational school, this school is known as a "Joint Vocational School." An extra appropriation of \$500 annually is granted to Joint Vocational Schools.

Girls in Home-making Department of the Blain School

Pupil-drawing power of rural community vocational schools of the state:

Year.	Percentage resident pupils.	Percentage non-resident pupils.
1916-17	48	52
1917-18	51	49
1918-19	53	47
1919-20	44	56

During 1919-20 there were 28 Rural Community Vocational Schools located in 23 counties with

a total enrollment of 1045 girls, 881 of which number were enrolled for home-making courses and 847 boys, 704 of which number were enrolled for agricultural courses. It is interesting to note that of the 219 junior girls who were in the 23 Rural Community Vocational Schools (the five new schools not having juniors enrolled) 154 elected to continue in vocational home-making courses and only 66 transferred to an academic course. On the basis of percentage, 70 per cent elected to continue in the home-making course. Of the 115 junior boys, 75 or 65 per cent, elected to continue in vocational agricultural courses.

A number of boroughs and towns desirous of giving their pupils the benefits of instruction in vocational agriculture and home economics organize departments in their high schools. Such organization involves chiefly the employment of properly qualified teachers and the provision of the necessary equipment.

Agricultural Departments

The vocational work in the agricultural department is conducted in much the same manner as in Rural Community Vocational Schools. Similar classes are taught and home projects supervised. As in other departments of a high school, pupils have the option of electing the vocational course. Pupils choosing the vocational course, enroll for two years. At the end of the two years they may take another course or continue the vocational work for two more years. The course of study in an agricultural department is the same as the agricultural course in a Rural Community Vocational School.

Vocational Departments of Home-making

The work in departments of home-making is also accomplished in much the same way as in the Rural Community Vocational Schools. In the classes in cookery, the girls learn to plan, prepare and serve well-balanced meals; to do the family baking; to make a study of food materials and their uses in the body. Classes in sewing, laundering, home nursing, household accounting and many other phases of home-making are included in the courses.

The school lunch which features in many of our rural schools furnishes a legitimate outlet for the cookery classes and at the same time provides an opportunity for the girls to do family quantity cooking. There are at present 14 departments of vocational home-making located in twelve different counties. There are 347 girls enrolled in these departments.

County vocational supervisors are country representatives of the Bureau of Vocational Education of the State Department of Public Instruction. In this capacity they have full charge of the county programs of agricultural and home economics instruction for all boys and girls of school age. They are attached to the staff of the County Superintendent of Schools and are located in the office of the County Superintendent. They receive their salaries and necessary traveling expenses from state funds.

There are at present 13 County Vocational Supervisors of Agriculture located as follows: Pittsburgh Allegheny Co.; Bellefonte, Center Co.; West Chester, Chester Co.; Clarion Co.; Bloomsburg, Columbia Co.; Meadville, Crawford Co.; Carlisle, Cumberland Co.; Harrisburg, Dauphin Co.; Williamsport, Lycoming Co.; Sunbury, Northumberland Co.; Coudersport, Potter Co.; Washington, Washington Co.; Greensburg, Westmoreland County. Three county vocational supervisors of home economics located as follows: Pittsburgh, Allegheny County; West Chester, Chester County; Bloomsburg, Columbia County.

Seeing is believing. Exhibits of actual work done by vocational pupils is convincing. It is even more convincing to see these boys and girls actually at work; to talk to their teachers; and to see the schools they attend.

Sunlight In the Farm Home

SUNLIGHT banishes disease and tones the family morale. It is always safe to build facing the sun. It is frequently unwise to ignore it. A little observation proves this. In a country village built at a cross-roads so that its streets ran north and south and east and west, those houses which faced south or whose living rooms were freely reached by the sun housed families whose health was generally good, except in a few instances where inherent disease seemed to yield to the favorable conditions. On the contrary where no advantage was taken of the sun and the living rooms were not reached by it to any extent and the bedrooms dark and shaded, the only cases of tuberculosis the village had known in years, occurred. Likewise people afflicted with tumors were found under these conditions.

In a normal country region, of twenty farm homes selected at random, those whose most-used family rooms were well supplied with sunlight show their inmates healthy or attaining health under those conditions. On the contrary, those who

the other hand where the family has for several generations tolerated low dark bedrooms with narrow, under-eave windows moving from old quarters into others of much the same type, a distinct tendency to disease has been noted, cancer and tuberculosis or abnormal growths have been the family heritage. Hereditary carelessness may be more dangerous than hereditary disease.

The above comparisons were made in a region where standards of living are high and climatic conditions usual, economic conditions being uniform so that the families compared were not suffering from sub-normal nutrition or any other cause.

The most used rooms of a house are living-room, dining-room, kitchen and bedrooms, of which the bedroom is not least important. To spend eight hours of every twenty-four in a dark, stuffy, poorly ventilated bedroom must lessen the benefit of a healthy outdoor life thru the day for a man. What of the women members of the family who have to spend hours in darkened or poorly ventilated rooms? The housewife

A New Jersey Farm Home. This shows how a Living Room was given Additional Light by the the Window Extension

homes were built or used with no regard for this principle—the family living on the dark side while the sunny rooms were darkened and kept as guest-rooms or parlors or where the house was heavily shaded by trees, there have occurred cancer, tuberculosis or cases of debility or anemia, one or the other of these in every instance where the unfavorable condition existed.

In one community two houses of precisely the same plan were built, neat, attractive and well lighted with the difference that one faced the sun and the other did not. In one house lived invalids—the house that faced the sun—and their condition improved. In the other normal healthy people took up their abode. They suffer much at the present time from colds and coughs and are pale and anemic looking. One family is as cleanly in its habits of living as the other and as well-nourished, the only advantage that one has over the other is the presence of the sun. Moreover, some families have for generations demanded certain requisites in their home structure while others have allowed themselves to be housed indifferently. Where the spacious, well-lighted, airy houses have been favored, sons following fathers in this type of building, the family constitution is good, the members of good physique and disease resistant. On

spends so much time in the kitchen that this room should be as bright and sunny as possible. Housewives who work in dark kitchens are usually pale and nervous.

For every 2000 cubic feet of space in a room facing south, there should be at least 50 square feet of actual lighting space in the windows. If the room is a northern exposure, this lighting space should be increased to seventy-five or one hundred square feet. Many object to more windows on the colder side of the house, but where there is less sunshine there is more light needed if health is to result.

Porch-shaded rooms on the first floor must admit more light by means of larger or more windows than upper-story rooms.

Closing blinds and heavily shading windows to save rugs and furniture is not economy of human life but a tacit invitation to the undertaker.—M. R. C.

Health is one of life's greatest assets for success; good health squandered is sheer waste of efficiency and happiness.

So much to do in the spring that it seems there is no time to get out in the glorious sunshine. But you owe it to yourself and to your family to keep fit.

THE NEW DOG LAW

Entire supervision of the enforcement of the licensing of dogs in the State of Pennsylvania will rest with the State Department of Agriculture, after January 15, 1922, under the provisions of a bill just signed by Governor William C. Sprout.

At the present time the commissioners of each county are charged with the enforcement of the dog license law, with mild supervisory powers vested in the Department of Agriculture. At the behest of the state organization of County Commissioners, the Pennsylvania State Sheepbreeders' Association and other agricultural organizations, the new law was introduced and passed at the recent session of the Legislature. The county commissioners of the state, along with the agricultural organizations, felt that the law could be more thoroughly enforced if placed directly and entirely in the hands of the Department of Agriculture.

Under the new law the Department of Agriculture will issue the license tags and blanks to the various county treasurers who will issue the same. A uniform license fee of \$1 for male dogs and \$2 for female dogs is fixed by the act, while an additional fee of ten cents is provided to compensate the county treasurer for his work. Assessors are also allowed five cents per name for the return of the names of dog owners in their districts, but the latter fee will be paid from the general dog fund.

The act of 1921 also provides that the state shall pay from the dog fund all losses for poultry and livestock killed or injured by dogs, also these amounts may be collected by the state where ownership of the dogs committing the depredations is established. The Department of Agriculture is entitled to a representative on the board that fixes the indemnities.

The actual enforcement of the dog law still remains in the hands of the constables and peace officers, but the Secretary of Agriculture is empowered to employ such help as is required, to see that the law is properly enforced in every section of the state. The funds derived from the license fees are paid into a state fund and from this fund the cost of enforcing the law, supplies, such as tax blanks, etc., are paid, while indemnities are also paid from this fund.

A dog owner, under the act of 1921, is responsible for the dog, as under the act of 1917 and full powers are conferred upon the proper authorities to see that the owner, and not the life of the dog, pays for the owner's negligence.

Good Advice

"This—uh—glub—spaghetti is awful—loh—gloh—slippery stuff!" complained a customer in the rapid-fire restaurant.

"Ad, don't try to eat it with your knife!" briskly said Heloise, the waitress. "Catch it by the tail and reel it in."

You can't start forests from stumps. If we are to have timber in the future, we must grow it as systematically as any other crop.

One bird man declares that insects make up two-thirds of the food of the birds. Yet some farmers still think that birds are their enemies instead of friends.

It Pays to Paint Now

"Get the jump" on dirt, flies and other insects that are detrimental to a first class job of painting later on.

The idea that paint is used only for appearance, is common in many localities. Paint improves the appearance of buildings and implements, but it is even more important that it be used to prevent deterioration. The high price of lumber makes it clear that the life of the buildings should be given more attention than when material and labor were less expensive.

Good Paint pays for itself, because it protects your property against decay, prolongs its life and adds to its appearance.

NICE Paint

has proved its worth during the past half a century. It will give you longest service at lowest cost and is the most economical paint your money can buy. Now is the time to paint and no matter how large or small the surface.

There's a "NICE" Product for Your Every Need

BUTTERMILK for Hogs and Poultry

Experienced feeders know that there is no better feed for growing hogs and poultry than buttermilk. A regular supply, however, has been difficult or impossible to obtain and feeders have had to do without it. A process has now been worked out for putting this valuable feed on the market in a condensed form, called SEMI-SOLID BUTTERMILK. By simply adding water you get real, genuine buttermilk with all its great feed value.

Semi-solid Buttermilk, like fresh buttermilk, is an appetizer and tonic, as well as a feed, and keeps hogs in prime condition.

The hogs consume it eagerly and thrive on it. It is a wonderful tonic and conditioner as well as a most valuable feed. Leaders of this issue interested in getting rapid growth and good, healthy stock should feed SEMI-SOLID BUTTERMILK. For further information about Semi-Solid Buttermilk and feeding hogs and poultry for greater profit, write to N. M. Neiser & Co., Dept. 3612, No. 3 Chestnut St., Philadelphia, Pa., or Consolidated Products Co., Dept. 3612, Lincoln, Neb.

Pennsylvania's Seed Law

THE SEED LAW passed by the last Legislature is the best seed law in the Union, according to Secretary Rasmussen who has made a careful study of the different state laws on this subject. The farmers of Pennsylvania are fully protected in the purchase of seeds, and the unscrupulous houses which have been dumping stuff labeled "Pure Seed" will have to find a market elsewhere.

The law does not attempt to grade seed but provides that it shall be labeled so that the buyer may have full information as to the contents of the package. He can then use his own judgment. Full information must be given on the following points: Common name, per cent of pure seed, per cent of weed seed, the name and number per ounce of noxious weeds, the per cent of germination, and the seller's name and address. Seeds containing dodder and Canada thistle, even to a small per cent, are prohibited from sale, and seed containing more than 3 per cent of any other weed seed is prohibited. Exceptions to the labeling clauses relate to small amounts of seed, and to seed that is to be reseeded before being sold for seed purposes. The law provides for injunctions to prevent the sale of impure seed.

Local Option on Daylight

ALTHO the State Legislatures have refused to enact so-called daylight-saving laws, and it is believed that Congress will not do so, many cities and smaller corporations have adopted daylight-saving for themselves. In so far as the action affects only those who want it they may have it and welcome. But it does not stop there. Tens of thousands of workers in town and city are opposed to the plan, but they are the plain people—the people who go to work early in the morning and their influence on law-making bodies is slight. The surrounding rural sections will also be affected more or less. Local train service is to be adapted to city time and this will necessitate change in the social and working customs of contributing sections. City papers realize the handicaps arising from the dual time plan, but they lay all the blame upon the opposition of the stubborn farmer. One paper intimates that since the Department of Agriculture has successfully reorganized agriculture during the past generation and brought it up to date it could, if it set itself to it, teach farmers how they could farm successfully by the daylight-saving plan. They will have to go to a higher and more omnipotent authority than the Department for that information. It will require a re-

Pennsylvania Farmer

June 4, 1921.

peal of some of Nature's laws and the amending of others so that the action of the sun and the dew and the hired man will conform to the man-made plan.

To Be Investigated

AGRICULTURE is to be investigated by Congress according to present indications. A concurrent resolution introduced proposes a joint commission to inquire into the present unhappy condition and to propose remedies. It is perhaps not fair to anticipate the results of such a move, yet we cannot help remembering the outcome of innumerable other investigations, and smiling. If, however, the investigation is honest and thorough enough to convince Congress and the public of the necessity of certain legislation which will permit farmers to help themselves it will not be in vain. We have always believed that the public will grant justice to any class of people once it is convinced of what is justice and right. It requires a great deal of publicity to establish a fact in the public mind and farmers themselves have not been able to do it in regard to their needs. Perhaps the publicity that will develop from such an investigation will put it over. It may help to counter-act the influence of a lot of stuff that is being published in certain papers and magazines, in one instance under the heading, "The New Menace." This propaganda tends to create the belief that the present farmer activities, and the passage of laws they are demanding, threaten the public and the national economic structure. Let us hope that Truth will prevail at the investigation.

The Other Fellow's Turn

CONGRESS has finally passed the Emergency Tariff bill introduced at the request of farmers. From the beginning, we have doubted the wisdom of demanding this legislation because we do not believe it will provide a remedy for the unsatisfactory market conditions in this country, and also because it gives every other industry a criterion for demanding high duties. Already we have indications that this belief was well founded. The passage of the bill has not yet arrested the steady decline in the price of farm products. The little flurry in wheat which occurred last week was due to the scare produced over reports of unfavorable weather in the Southwest. Giving the farmers what they asked for encourages the representatives of other industries in Congress to press the claims of their constituents for much higher tariff duties. In some instances demands are being pushed for rates higher even than those of the Payne-Aldrich bill. We firmly believe that every country may properly lay such tariff duties as will fairly equalize production costs which are normal and fair, but it is suicidal to force prices too far above the world's price-level.

There is urgent need for tariff revision at this time, but it should be a scientific revision made after a careful inquiry into the necessities of the case as viewed in the light of our changed international relations. It is not a safe practice to allow each section or industry to dictate the making of its own tariff schedules.

Favorable Progress

THE DOWNWARD movement in prices continues in most lines. The temper of the buying public improves in proportion and goods are moving at a somewhat faster pace than for several months. This is a good indication and if deflation continues it would seem that the so-called buyers' strike would be "off" before long. Retailers are finding that reduced prices are the only thing that will induce the public to buy beyond the merest necessities.

One big business man said recently that the farmers' buying power was the only thing that saved us from experiencing a much worse condition than we have had during the past six months. The farmer's business is so big and his needs so great that, even if restricted to necessities, his purchases amount to hundreds of millions of dollars in a single season. Even if the sale of his products returns little or no wages for himself and family, still the aggregate amount received is so great that it contributes mightily towards keeping business going. As new crops

having lower production costs are sold the farmers' buying power will increase and we may expect increasing contentment and prosperity on the farms.

No other business requires such a variety of manufactured products as does agriculture, for the business of farming includes the home and the maintenance of the family as well as the operations in field and barn. Successful farming requires the purchase of everything from a paper of pins to costly and intricate machinery. For this reason the upkeep of a business engaging forty million people is by far the biggest thing in the nation, and since it cannot be run intermittently it is the natural balance wheel of business. The farmer is, by virtue of necessity, a liberal spender and he is likely to get back to normal buying first of all.

Trim the Roadsides

GOVERNOR SPROUL vetoed the bill passed by the last Legislature which required that all owners of land abutting on public roads must cut all grass, briars and weeds growing along the roadsides. The bill provided that, in the event of the failure of owners to do so, the supervisors should do it after the first of September and charge the cost against the land owner. The Governor holds that it is wrong to compel farmers to do a very substantial amount of work for which there is no compensation in addition to paying his share of tax. It is a sensible exercise of the veto power and farmers will approve.

The best farmers of the state do this work voluntarily because it adds to the appearance of their properties besides tending to eradicate weeds which spread to adjoining fields. The state has control over all the land embraced in the right-of-way of public roads and road commissioners have charge of it. If the rubbish growing there tends to the accumulation of snow as the bill declares it is the business of road supervisors to cut the trash. However, we approve of the voluntary work done by farmers because it adds much to the appearance of a farm to have trim, neat roadsides.

Our Washington Letter

Federal aid for highway construction and the Cummins railway investigation are the two outstanding matters before the Congressional committees this week.

General Pershing was a leading witness before the Senate Post Roads Committee, which is considering the Townsend Federal road bill. Basing his statements on his observations in France, General Pershing said he thought a Federal highway commission, such as is provided in the pending Townsend bill was necessary to unify the various state highway projects into one continuous system. He declared that money appropriated to build roads for which maintenance was not provided was wasted.

Discussing the question as to whether Federal money ought to be spent on trunk lines or on so-called farm to market roads, General Pershing said: "All roads must lead to the farms. The farmer is the fellow to consider first. We all know how difficult his problems are. I would begin with the county roads and develop together a system of market and trunk highways."

Recently Professor T. C. Atkeson, Washington representative of the National Grange, sent out a questionnaire to highway officials in all the states, on the policy of the state highway departments regarding Federal aid to highways. Some interesting information is found in these replies.

The New York state officials write: "We are confining the expenditure of Federal aid funds to a definite system provided by law, which contains 11,225 miles, the total road mileage of the state being approximately \$0,000."

In Pennsylvania, the state officials say, "the expenditure of Federal aid funds is confined to a selected system of inter-county and state roads. The total mileage of the state highway system in Pennsylvania is 10,235, which is between nine and ten per cent of the total mileage of road within the limits of the state."

Some of the state authorities say they are opposed to Federal aid in constructing market or county roads. The answers show that from three to seven per cent of the highways in the different states are improved.

If one man had purchased all the wheat grown in the United States at the October price from 1853 to 1920, and had sold it at the May price each year, his total gain would have been about seven per cent as the return for caring for the grain seven months. This conclusion is based on

June 4, 1921.

an investigation of the Chicago grain market reports covering the past sixty-two years, made by Professor Atkeson, in which he finds no evidence that speculators have systematically forced up prices after the crops have passed out of the hands of the producers. Considering the interest on the investment in holding the grain and shrinkage in weight, Professor Atkeson figures that it would have been better if the farmers had sold their wheat at the October price. He believes that this investigation completely answers the claims that the price of wheat is forced down artificially when the farmers have the grain to sell.

The railroad investigation is being conducted before the Interstate Commerce Committee of the Senate, with the railroad officials dividing the blame for the present situation between the high wages they are compelled to pay for labor and the mistakes of the government railway administration during the war period. They are insisting that the rates cannot come down, and that the government should reimburse the railroads for losses that are piling up under the present high freight rates. There is a strong and growing sentiment in Congress that railroad rates must come down. The contention of Daniel Willard, president of the Baltimore and Ohio Railroad, that "the services of the railroad are rather more than the service of the tree or the packing of the apples, where nature does most of the producing," is not convincing to the Senator who has just received a letter from a constituent, saying that he had shipped several hundred barrels of apples from his orchards to market, and had only seven cents a barrel left after paying the freight charges.

The railroads may prevent the passage of a bill calling for the repeal of the section of the transportation act directing the Interstate Commerce Commission to make rates which will assure a return of six per cent to the carriers, but it will require a hard fight in Congress. There is very active opposition in Congress to perpetuating the cost-plus scheme, whether it applies to government contracts or transportation.

The Senate banking committee has made a favorable report on the bill to increase the rate of interest on farm loan bonds from 5 to 5½ per cent.

The status of the Capper-Volstead farmers' collective bargaining bills is a source of anxiety to the farm organization representatives. The Volstead bill, which passed the House, was referred to the Senate Judiciary Committee, and it is believed that this committee will not report favorably on the bill without the amendments which were so objectionable to farmers that were added to the former bill.—Elmer E. Reynolds.

HARRISBURG LETTER

Must Plan Work Again.—Such tremendous cuts were made in appropriations for various departments of the state government by the Governor that it will take a week or more for some of them to readjust their plans. In several instances heads of branches of the government appeared to be laboring under the idea that they were going to get more money than ever and did not cut down their projects. Others took notice of the situation and will be ready to face the conditions. The Department of Agriculture and Forestry are two which will be in good shape to go ahead. The former department will have to curtail considerably its field work and also to give up some branches of inside activity in the way of investigations, while there will be abandonment of plans for expansion of the Bureau of Markets. Farmers Institutes have been given up, no appropriation being made. It has been calculated that the work of State College has grown so much that this line of educational activity can be taken up in other ways. The Department of Forestry gets no money for purchase of lands, but the million dollars asked to organize a fire fighting service which will protect what the state owns went thru without a cent being taken off.

Tremendous Cuts Made.—The Governor surpassed all records for reduction of appropriations, probably a score of millions being cut off the bills. It is reckoned appropriations aggregating \$116,000,000 got by, the hospitals and homes

which should be supported by their home communities getting the usual share of the public funds. The revenues will run probably \$120,000,000 if the state realizes on the anthracite and gasoline taxes in time to count them in. Lawsuits on both are threatened. Half of the gasoline tax which is collected in each county will go back to that county for use on roads or in payment of highway obligations. There

Pennsylvania Farmer

7-583

have been reports for some time that the State might not get the use of money hoped for until next year. Some investigations of the condition of the balances has also been in progress and it is possible that more may be known about the actual financial condition of the Commonwealth before the end of summer than has been known for a decade or two. Complaints about appropriations have directed attention to State finances at a rate which is unusual and as large bond issues are to be made soon this interest in the Commonwealth's affairs may grow.

State College Hard Hit.—State College suffered a reduction of a million dollars in its appropriation, the building appropriation being cut about \$600,000 while the general extension work allowance was also curtailed. It is said here that state authorities are counting on more Federal aid.

To Continue Commission.—The State Taxation Commission, which drafted the code for cutting cost of collecting taxes in half and which

consist of a dozen members and exercise wide influence.

To Battle Pests.—Arrangements have been made by State authorities to combat the Japanese beetle and gypsy moth, both of which have been reported in this state. Co-operation with Federal authorities has been arranged.

State Money Refused.—One of the oddest vetoes has been recorded at the Capitol. The Governor in disapproving an appropriation for a Philadelphia institution said he had been asked to do so by the people in charge of the hospital who said it was too small and would discourage contributors.

Grant Eminent Domain.—The Governor has approved bills giving electric companies the right of eminent domain, which means they can take land for pole lines. However, application must be made to the Public Service Commission, which must give hearings and the right of appeal is safeguarded.

NEW YORK LETTER

Dean Mann Loyal to Present Position.—Dean A. R. Mann, of the State College of Agriculture, has declined to accept the appointment as State Commissioner of Agriculture, as he deems his present work of great importance to agriculture. The next choice will be Mr. Raymond Pearson or Mr. George E. Hogue, both of whom have served before in the office.

Radio Market News.—The State College of Agriculture is soon to receive daily market news by radiophone and will relay it to shipping stations and to farmers who desire the service. The news reaches the final destination in English instead of in dots and dashes and is fresher, arriving at a more practical hour of the day than the old service gave.

Valuable Holstein.—A Sharon farmer has a purebred Holstein heifer that has born six calves, and is still in her third year. The last ones are twin heifers.

Wool Rebate.—Few farmers of the state have as yet received their rebate from the government on wool sales made during the war. One wool grower reports receiving his, amounting to 14 cents. The rebate is not expected to in any measure balance present low wool prices.

Calf and Heifer Clubs.—The sale of club calves to junior project workers of Tompkins County was held on Saturday. Only eleven juniors signed to work with calves as compared to 18 last year. A heifer club and later a dairy cow club will be organized to keep up the interest of contestants from year to year. With this year's calf one boy who entered last year for the first will have four purebreds, earned in this way. The plan leads often to the replacing of scrubs with purebreds on the farm where the juniors reside.

For Cattle Indemnities.—New York dairymen who have worked for sufficient Federal appropriations to cover indemnities for cattle condemned because of tuberculosis are interested to know that due to their Congressman W. W. Magee they are likely to get the full amount demanded, \$405,000.

Trade Mark Eggs.—Four communities of Tioga County will unite to market first-class eggs, bearing a county trade mark. They will also hold poultry culling demonstrations and will stage a big poultry exhibit at the fair. Certification of flocks will be pushed next spring and the distribution of eggs from certified flocks.

Low Average of Disease.—In the county area work of freeing Tompkins County cattle from tuberculosis but 9.5 per cent of the 626 animals so far tested have reacted, speaking well of health conditions in that county.

Onion Loss.—Over 10,000 bushels of onions were thrown on dumps or plowed under last week in the Fulton onion growing section, as there was no market. This seems a pity with onions retailing at about the usual prices—and proves the need of co-operative marketing methods. Grower distribution of food crops. Early cabbage prices in New York took a slump this week, due to the arrival of 75 carloads in one day.

Frosts Do Further Damage.—What small fruits escaped the early frosts were ruined in the big freeze of last week in central and northern counties. In Oswego County thousands of bushels were lost.

Governor Pleaded.—Besides reorganizing all state departments so they will render more efficient service the Governor's plan of expense elimination has saved the state \$15,000,000 as compared to last year's expenses. Practically never has the Legislature done more practical work than this year, proving the value of strong right leadership.

Annual Holstein Meeting.—On May 31 the delegates to National Holstein Breeders' Ass'n met on the State Fair grounds at Syracuse. The greatest sale of this body is staged for June 2, 3 and 4.

Dress and Tam Made by Junior Girl in West Lampeter Vocational School

The legislators declined to consider on the ground of too much disturbance of conditions long established, has been continued for another two years and charged to make a report to the next Legislature. Efforts will be made to overcome objections in certain features of the code, but the disposition of members is still to get rid of many officers and thus cut costs.

More Road Contracts Let.—Contracts for highways running into the millions in the aggregate have been let by the state the last few days and probably 700 miles will be in course of construction during the year. Start of highway work has relieved the unemployment situation in many sections of the state and men are traveling miles to get jobs.

School Law Changes.—It will take weeks to get digested and prepared for general use all of the changes made in the school code. The law during the coming term and fourth class district officers will receive word as to the expectations of the State authorities. Incidentally, general educational authority has been concentrated in a State Council of Education, which succeeds the State Board and various other bodies. This will

HORTICULTURE

Fruit Crop Prospects

By J. P. STEWART

IT SEEMS that the farther we go into the present season, the more certain it becomes that the fruit crop in general is going to be very light. Orchards in the more northern sections of the general eastern apple belt, which had largely escaped the earlier freezes, and upon which we were depending for the most of our fruit this year, had their session with the frosts on the 16th and 17th of May, with very unfortunate results so far as the stone fruits at least were concerned. The apples were also hit pretty hard in many places by this last reminder of winter, but just how great the final reduction on this crop will be, cannot be told at present.

Recent reports from the Ozark region, of Arkansas, Missouri, and southern Illinois, indicate that their fruit was practically all wiped out by the same freezes, in the latter part of March and two weeks later that played such havoc with the orchards of southern Pennsylvania,

be successfully met by making arrangements for a "long pull" on the best storage stock. Incidentally, it should be noted that it is chiefly the yellow Newtowns or Albemarle that are bringing the high prices in barrels just now, and the old Ben which should be coming into action at this time is still quoted at very modest figures.

Developments in Spraying

Good Staymans and Spies can be kept in good shape until the middle of May under the best storage conditions, but it is probable that more attention will have to be given to the prevention of scald, especially on the Stayman, before such an attempt could be made safely. The use of ventilation and ventilated packages in the storage room is likely to be important in this connection, and even wrapping some of the fruit with the special wrappers recently suggested by the Federal Bureau of Markets may become worth while.

A Modest Roadside Market in New Jersey

Ohio, and southward, this year. This included even the strawberries in Arkansas, which are reported to have been nearly wiped out. This fact is probably now being reflected in the abnormally high prices which strawberries are bringing in the cities, although freight rates and the ubiquitous middlemen are doubtless doing their share.

The prices of apples also have been mounting upward recently, especially in the New York market where \$4 to \$6 for a bushel box is not unusual, and \$10 to \$14 per barrel for varieties of good quality is becoming quite common. Many of the other markets have not yet been shaken loose from their \$4 to \$6 per barrel quotations, but they will probably fall into the procession when their local supply begins running short.

Profits from Storage Fruit

The appearance of these prices at this time is worth remembering on the part of those who may be going to store apples another year. It is not likely that we will have another crop soon, which will take until the middle of May to get the cheap stuff out of the way, but it is worth noting that even such conditions can

royalties to a certain California firm which now levies such tribute on practically all the lead arsenate that is now being made thruout the country. This should enable the present owners to put out their product at least as cheap as any of the other forms, and probably even cheaper.

This material has been out in a small way for a couple of years but this is the first season that the writer has seen it used regularly on a large scale, and from the way it is behaving now, it certainly deserves consideration in making out our next order.

The new type of dry lime-sulphur is being made by simply shooting the liquid concentrated in a fine spray into the upper part of an evaporation chamber, whereupon it promptly loses its excess moisture and drops in a very fine solid form to the floor of the chamber. This is supposed to yield a lime-sulphur in dry or solid form, which is 100 per cent pure and which will re-dissolve when added to water to a much greater extent than any of the other dry lime-sulphurs now on the market. Whether this latter assumption is correct or not can be determined later. If it is correct, it will undoubtedly fill an important gap in the present line of commercial spray materials. The true lime-sulphur in dry form is undoubtedly the best possible material from the commercial viewpoint, but the solubility of such forms of this material as have come to the writer's attention up to this time has not been sufficient to command full approval. Whenever this fault can be remedied, however, the commercial lime sulphur problem will be solved.

SPRAYING CUCUMBER VINES

On the platform of the railroad were piled fifty or sixty hampers, and being curious I examined the contents and found the packages contained cucumbers which were being shipped to a New York commission man. Looking at the shipper's name it was quite a surprise to note that it was a man of my acquaintance.

Coming by the railroad station several days later I saw this man unloading twice as many hampers of cucumbers as he had unloaded on the previous visit. As none of the neighbors had yet started picking their patches it seemed as though this man had stolen a march on them. On remarking this to him I asked him by what means he obtained his cucumbers so early. "By spraying and seed selection." When I asked why he had not mentioned seed selection first he told me he considered spraying as paramount, and very careful spraying at that.

Then he told me the history of his father a trucker on Long Island. One of their main crops was cucumbers. The family began to put a larger acreage in every year and made good money. Then disease came, blight came every year and struck the crop earlier until it was impossible to grow a crop that would even pay expenses. His father decided to move to a new farm in another state. At this time the various experiment stations were doing all in their power to help the growers, and then the discovery came of the helpful effect of Bordeaux mixture to retard the blight. His father was one of the first to adopt the practice of thorough spraying, and it has been so firmly fixed in the mind of the son that he carries on this operation of spraying so that it is almost impossible for his plants to become diseased or

CHORES

The stock-keeper can no more avoid chores than he can death or taxes.

The work of caring for livestock on the average American farm is known as "chores"; and for some reason this term is not popular with the hired men and boys. Much of this unpopularity is due to the crude and hard way which we go about the work. Modern farm buildings and improvements are comparatively new, but even today are woefully lacking in proper equipment. It has been said that humanity is prone to run in ruts, and is always slow to adopt new ideas. From earliest times, ridicule, ostracism and even death have been the portion of him who would pull the wheels of progress out from the rut of "well enough." The introduction of the spinning jenny, the power loom and other textile machinery in England caused nation-wide riots.

Things are now changing rapidly, and decidedly for the better. We have learned that it is not only wise but profitable to adopt labor-saving

am often surprised to find, even on good farms, this method still in use. There is very great need for improvement; and we are fortunate in having a splendid supply of modern equipment now being placed on the market, and at reasonable prices.

A great number of inventions have recently appeared which not only save labor but also add comfort and safety to the stock. The old barn door can be replaced by a splendid roller track system, so that a small child can easily operate it; strong and easily operated carriers are manufactured which lighten the task, and make it possible for one man to do the work of three. These carriers convey the manure out of the barn and drop it into the manure spreader, no heavy lifting being required. Feed carriers, running on a track down the long rows, make the work of feeding real play for the farm boy; stalls for animals are made which are comfortable, easy to operate and built to last a life time;

with such appliances it is a pleasure to put the stock in or out of the barn. Milking machines of several makes and kinds are now success-

Registered Brown Swiss Yearling Bulls. Owned by C. M. Robinson, Crawford Co., Pa.

machinery and treat our animals in a humane and efficient manner.

During the past few years of war and unsettled conditions our farm building program has been postponed, and we are now confronted with the necessity of going ahead. The period of readjustment has been severe on the farmer, and he feels more than ever before the need of improvements which will result in economy and profit.

The chores, or caring for the livestock on the average farm, often falls to the boy and the hired man. While this is important work, it is often neglected because of its disagreeable features. If the proprietor was obliged to perform the task himself, he would probably be more inclined to put in improvements which would lighten the labor.

As I was raised on a dairy farm where we kept not only a large milking herd, but also horses, sheep and swine, I have had my experience with chores; and the dark, poorly-ventilated basement barn is still fresh in my memory. Cleaning the stables by the wheelbarrow and slippery plank method were then in vogue. As I go about the country today, I

fully being operated in many of our large dairies, and with modern equipment they are easily installed. Feed grinders, elevators and carriers convey the grains and mill feeds rapidly and easily to their places of use; in fact every detail of the work in caring for animals has been looked after with great skill and ingenuity. Self feeders and hog pens are provided for the swine, and the mortality in this great industry has thereby been greatly lessened.

The good results which come from better equipment too often are overlooked. Much disease among livestock, especially tuberculosis, is spread and developed thru poorly ventilated and unsanitary barns and equipment. The product, especially that of the dairy, brings a higher price when produced in a clean and well-equipped barn. Time and expense of labor can be saved when things are handy; livestock do better, look better and sell better when properly cared for in good quarters, and the term "chores" has a new and far better meaning under this new order of things.—A. L. Haacker, Lancaster Co.

Livestock Losses in Shipping

By W. H. TOMIHAVE

FEW people realize the loss to the producer, packer and consumer that takes place in shipping livestock to market. This loss is not only caused by animals dying while in transit, but thru bruises and injuries of one kind or another. It is difficult to estimate the amount of this loss in terms of money, but it amounts to millions of dollars each year. Some of this loss is unavoidable, but a great deal is caused by carelessness on the part of some person who has something to do with the handling of the livestock at some stage of the marketing route. It may be in loading, while in transit or after the animals have been unloaded at the central market.

The loss may not seem large when only one individual case is considered—a slight bruise of a few hogs or cattle in one car, or the death of an occasional hog in a shipment does not seem to represent any large sum of money. It is estimated that the total loss last year thru death or bruised condition thru poor handling in marketing hogs, amounted to approximately \$3,508,880. This loss represents approximately \$0.000 hogs, all of which is a distinct loss to the meat industry and must be paid for by some one. It seems that much of this loss might be avoided if it were possible to have closer supervision in the handling of livestock in transit or at the loading and unloading centers. Investigations show that the principal losses are caused thru injuries due to mistreatment, delays in shipment or transit, improper pens and chutes, together with rough handling at the unloading centers. Shippers are also frequently at fault in that they do not provide the proper bedding for the livestock, and excessive loading which causes losses from suffocation.

The Institute of American Meat Packers started an investigation to secure all information possible concerning the cause of losses in shipping livestock and to suggest ways and means of overcoming such losses. A survey made by this organization shows that during 1919 approximately 10,089,984 cattle were slaughtered under Federal inspection in the United States. Of this number of cattle slaughtered, approximately 2,900,000 head reached the slaughter house in a bruised condition which represents about 29 per cent of all the cattle handled in Federal inspected establishments. The extent of the bruises varied but it represents an average loss of 1.27 pounds of beef per carcass or a total of 3,716,140 pounds of meat that could be used for food.

The American Institute of Meat Packers has recently issued a pamphlet that gives a survey of its findings concerning the reason for such heavy losses and offers a number of timely suggestions as to how such losses may be avoided. These are in substance, as follows: Care should be exercised in bedding cars for loading. Never permit cinders, rock dust, coal slack or similar material to be used. For shipping hogs during the summer months, use sand if it can be secured. For winter shipping, use good, clean straw in sufficient quantities to keep the animals comfortable. Cattle cars should be loaded in this way as it means crippled, trampled, suffocated and dead animals. It is false economy to overload the cars. Don't try to save money in this way as it means crippled, trampled, suffocated and dead animals. It is recommended that the safe minimum for loading a 36-ft. car should be: cattle, 22,000 lbs.; single deck, 16,000 lbs.; sheep, single deck, 12,000 lbs.; double deck, 18,000 lbs.; calves, double deck, 22,000 lbs.; single deck, 14,000 lbs. The present minimum on most railroads is about 1000 lbs. in excess of these weights. Losses are frequently caused by nails protruding in the cars. These should be removed and every shipper should examine the door fastenings and see that they are in proper repair. Care should be exercised in loading and unloading livestock, especially if the chutes are steep. Hogs should not be driven hurriedly in hot weather as they can not stand very much heat. If the hogs are hot and panting when they reach the loading station, they should be allowed to rest before loading; otherwise, they are likely to die from suffocation. Overheated hogs should not have cold water thrown over their backs, but should be sprinkled with a fine spray on the belly or the floor of the car should be moistened. All of these suggestions are important and severe losses can be avoided if these rules are observed. The enormous livestock losses which now occur annually can be materially reduced if the shipper will use the proper precaution and see that the livestock is loaded in good condition. The railroad companies should provide competent attendants where the livestock must be unloaded, and also provide better service for the transportation of livestock and the switching thru the division centers.

Greater care in the handling and unloading of the livestock at the marketing centers will also aid in reducing losses. HAMPSHIRE SWINE BREEDERS The Hampshire swine breeders of Pennsylvania have perfected a state organization, elected officers and obtained a charter. Ten acting field men have been appointed. Mr. F. W. Fogelsanger, Chambersburg, is secretary-treasurer. There is a movement on foot to make it possible for every member of the state organization to be a member of his own county organization, and in addition, a member of the National Swine Growers' Association of America.

The members are making arrangements for a meeting which will be held perhaps early in June at Chambersburg, Pa. E. C. Stone, of Peoria, Ill., secretary of the American Hampshire Swine Record Association, president of Association of all Purebred Swine Records and also vice president of the National Swine Growers' Association of America will be the principal speaker.

Salvaging the World's Crops With Case All-Crop Threshers

In the important work of salvaging the world's crops after they are harvested, Case Steel-built, Galvanized Threshers each year render a great service to Humanity and Civilization. Without the help of modern threshers, such as Case Machines, it would be impossible for the farm workers of today to save the annual crops.

A Size for Every Need

Case Threshers have been built since 1842 and this line of justly renowned threshing machines now includes a thresher for every seed crop and a size suitable for every threshing need. There is the small 20 x 28 machine for individual threshing, while the light weight 22 x 36 and 26 x 46 threshers are ideal for average "community" service and the 28 x 50, 32 x 54, 36 x 58, and 40 x 62 big-capacity machines meet every requirement for custom threshing on any scale.

A Thresher for Every Seed Crop

In localities where grain and hay are the principal crops, Case Grain and Grass-seed Threshers are upholding and adding to Case reputation for clean threshing, thorough separation, perfect cleaning and complete saving of the threshed crop. In the pea- and bean-growing districts Case Pea and Bean Threshers are rendering a like service. In rice-growing sections of the world Case Rice Threshers, which are unaffected by moisture, are performing their work with equal satisfaction and the same is true of Case Peanut Threshers.

Case Threshers are "all-crop" machines. That is, at a slight additional cost, they can be equipped and adjusted to handle grain, grass seed, peas, beans, rice or peanuts. This may be done in the field in a short time.

Attachments for Case Threshers

All sizes of Case Threshers can be equipped with feeder or hand feed; windstacker or common stacker, or any one of a variety of improved grain handlers. All of these attachments are of our own design—Case-made for Case Machines.

No matter where you are, nor what crop you grow, there is a Case Thresher of a size and type to meet your requirements. Our catalog may prove of interest to you.

Light and Power Problems

A SHORT time ago a farm electric plant service man told me of a case he worked on. He had received a call some eighteen miles out in the country to fix a plant that was not delivering the goods.

"Some one told this farmer to clean the commutator on his generator. It was sparking a great deal and the generator was not charging the battery as it should," explained the service man to me. "That part was all right and probably the cleaning of the commutator was necessary. But where this farmer fell down was the way he decided to do the job. Knowing that steel wool was one of the best things he could get to rub off dirt from a metal surface he decided to use it for this job. He applied the steel wool to the commutator while the generator was running. The result was sad to behold and the entire outfit looked like Santa Claus with a hundred growth of whiskers."

Steel wool is nothing but iron. The commutator core and the core of the armature are ironed also and are magnetized, as is the field coil core. When the steel wool was applied it simply jumped into every corner in that generator. It was attracted by the magnetized parts of the generator. It was a wonder that the service man was able to do anything with it. The job took over a day and all the particles of steel wool were not removed even then.

Never use steel wool to clean anything about a generator or a motor. If nothing else, it will very likely "short circuit" the segments of the commutator. Very fine sand paper or emery cloth is the best thing to use. Even with that care must be taken not to get the dust particles around the bearings.

"Can you advise me what size wire to use to connect up a 60-watt yard lamp located 800 feet away from my 32-volt plant?" asks E. B. S.

Use number 6 B. & S. gage copper wire.

"I would like to know what the 'load' is for most lights and accessories used on 32-volt outfits? For instance how many watts does an electric iron consume?" writes a northern Pennsylvania farmer.

In the following electric consumption table I have listed the "loads" caused on a plant by the addition of any one of following electric bulbs or accessories. Here is the table:

Lamps—Standard	Sizes—32	Volts
5 watts	3 candle power	
10 watts	7 candle power	
20 watts	15 candle power	
40 watts	32 candle power	
50 watts	55 candle power	
75 watts	85 candle power	
100 watts	125 candle power	
—110 Volts—		
10 watts	6 candle power	
15 watts	10 candle power	
25 watts	18 candle power	
40 watts	30 candle power	
75 watts	69 candle power	
100 watts	100 candle power	

Heating Devices

Electric irons	525 watts
Curling iron heater	90 watts
1 Pt. water heater	300 watts
1 Qt. water heater	500 watts
Toaster	440 watts
Percolator	420 watts
Disc stove 4 in. diam.	450 watts
Disc stove 6 in. diam.	600 watts

—Motors—		
	Output watts.	Input watts.
1/4 H. P.	95	150
1/6 H. P.	125	175
1/4 H. P.	185	350
1/2 H. P.	375	700
3/4 H. P.	550	1050
1 H. P.	746	1250
1 1/2 H. P.	1120	1870
2 H. P.	1492	2500
—Accessories—		
	Watts	
Churns	175-700	
Dishwasher	100	
Incubators	25	
Sewing machines or motors	20	
Vacuum cleaners	120	
Pumps	150-700	
Washing machine	230	
Fans	20-60	

Every now and then I meet a farmer who is "sore" on all farm light and power plants. Claims they won't run anything.

"Why, if we light two or three lights and turn on the electric from the whole works dies out," he states.

Now that is not the plant's fault. The fault lies with the farmer or more often with the dealer. The plant is entirely too small for its job.

If a farmer had a big heavy truck mired in the mud he would not take his light carriage mare to pull it out. No, he would hitch his team of heavy farm horses. The mare might be the best blooded animal in the state and perfect as a carriage horse. Simply the job would be too heavy. The same with the farm light and power plant. It may be the best in the state but that does not mean it can do everything.

In buying farm light and power plants the farmer wants to figure everything he may want operated by electricity. Then the length and size of wires must be taken into consideration. How much of a load will the maximum load be at any one time? This is figured in kilowatts.

It is wise for the buyer of a plant to determine this for himself. The dealer, in his anxiety to make a sale, may let the farmer buy something not big enough in order to keep the price down. It is well for the farmer to figure out everything he will possibly want to do with the plant before he decides what size to buy.

"Can you give me the definition or explanation of the following terms: Watts, watt-hour and kilowatt hour?"

The watt is the unit of electric power. It is the product of the current in amperes flowing in a circuit by the pressure in the volts. It is 1-746th of a horse power.

The watt hour is the unit of electrical energy. The given watt-hour capacity of a battery, for instance, means the ability of a battery to furnish one watt for the given number of hours or given number of watts for a number of hours such that their product will be the given watt hours. The kilowatt is an electrical unit equal to 1000 watts.

A kilowatt hour is 1000 watts used for one hour. A kilowatt hour may be used in any portion of an hour. For instance, if 60,000 watts were used for an hour it would equal 60 kilowatt hours and, therefore, 1-60th of this, or one kilowatt hour, could be used in one minute.

A Chester Co., Pa., farmer wants

to know, "Why can't I buy a generator and have it attached to my old gasoline engine and then have a farm lighting plant?"

Hooking a generator up to your gasoline engine, would seem to me about the same thing as hitching up a mule to a good horse and trying to make a perfectly matched team out of them. The mule and the horse would do all right for emergency use as a make-shift, but you never could expect the team work you would get from a perfectly matched span of Percherons. To give continuous service every part of a lighting unit must be made by the same manufacturers, in the same factory. Each part—the engine, generator and switchboard must be designed to co-operate with each other. Not only designed, but they must be built to work in perfect harmony for a great many years. This is one of the reasons for the big success of farm light and power plants. They are designed and built and sold as one harmonious unit—each part is in perfect step with all others and will stay in tune with each other as long as the complete plant holds together. To buy a generator in one place, use an old engine and a home-made switchboard would seem to me to be about the same thing as accepting a substitute for gold. There isn't any. I may have put this a little too strong, but honestly believe that what I am telling you is for your own good.—Alex G. Cruikshank.

HAYING WITH THE TRACTOR

Using the tractor in the hay field is no novelty; it is one of the places where the tractor makes work go along more smoothly and rapidly and saves both horse and man flesh. At least, that has been our experience. Hay making is one of those farm operations that calls for plenty of heavy work in a short space of time. But by using a tractor to pull the wagons in the fields, a loader to load the hay direct from the swath or windrow, and a hay fork and carrier in the barn we find many hands eliminated and the work made much simpler and easier than it formerly

Loading Hay With a Tractor

was when hands did nearly everything else except pull the wagons.

One of the best features we found about the use of the tractor in haying was the steady, dependable power. The wagon and loader can be pulled along at a steady pace without any jerking or stopping at intervals which does not throw the men on the wagon off balance, and the tractor can be speeded up a little when you come to a place in the field where the hay is thin on the ground or it may be slowed when coming to heavier spots, which is very convenient for the men loading. In case it looks like rain the tractor can be speeded up more which will take two or three men on the wagons to load, and this may mean getting in one or more loads that would have been possible if horses were being used.

It is Kodak Made.

The No. 2A Folding BROWNIE

\$10.00

Honest workmanship has become a habit in the Kodak factories, and it is in those factories, in the skilled hands of Kodak workmen and under Kodak superintendence, that the Brownie cameras are made.

The 2A Folding Brownie gives a happy combination of real convenience and efficiency with genuine economy. The pictures are 2 1/4 x 4 1/4 inches, a really satisfactory size, yet not so large as to make the film and printing costs high. The folding feature makes it convenient to carry; the excellent finish is both durable and pleasing.

The Kodak Ball Bearing shutter, with which this camera is fitted, is quiet and certain in action. It has snap-shot speeds of 1/25, 1/50 and 1/100 of a second and the usual "time" features.

The Meniscus Achromatic lens is of excellent quality and each one is carefully tested.

Like all Kodaks and Folding Brownies, the No. 2A is autographic—provides the means for dating and titling the negatives at the time the exposure is made. This camera has two tripod sockets, a finder and an accurate focusing scale.

The price, ten dollars, includes the excise war tax and the films are but thirty cents for six exposures. Picture taking with a Brownie camera is very simple and is less expensive than you think.

Catalogue of Kodaks and Brownies free at your dealer's or by mail.

EASTMAN KODAK COMPANY, ROCHESTER, N. Y., The Kodak City

PENNSYLVANIA FOR GRAIN DRILL SERVICE

Here is a compact outfit that sows all kinds of grain and fertilizer with minute accuracy. Quantities regulated by levers convenient to operator. Grass seeder either in front or behind openers, as desired. Low down construction throughout with hopper always in balance.

The Pennsylvania is built in sizes 8 to 12 tubes with choice of Pin Hoe, Spring Hoe or Single Disc openers. Special Drill Catalogue fully explaining efficient seeding mailed on request.

A. B. FARQUHAR CO., Ltd., Box 546, York, Pa.
Also Engines and Rollers, Sawmills, Thrashers, Potato Diggers. Write for description.

Positive Force Feeds
Chain Drive Insures
Accurate Seeding

Two pieces of 2 by 2 inch oak were fastened to either side flush with the top giving a more finished appearance and adding an extra four inches to the width.

Drawers were added and a vise of the revolving type and a good bench top were made a part of the equipment.

We all may not have silo fillers to brag but oftentimes a frame may be picked up at a sale for junk price or less, or it may be made at home.—H. A. C., Montgomery Co., Pa.

WESTERN CANADA Land of Prosperity

offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available on easy terms

Fertile Land at \$15 to \$30 an Acre
—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—oats, barley and flax also in great abundance, while raising horses, cattle, sheep and hogs is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living.

Farm Gardens, Poultry, Dairying
are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facilities, rural telephone, etc.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

160 ACRES FARM IN WESTERN CANADA FREE

Two Billion Dollars Per Year!

A LEADING agricultural expert estimates that this enormous sum would be added annually to our agricultural production if our swamp lands were properly drained.

This state has thousands of acres of rich soil lying under water—you probably have some wet spots on your own farm, waiting for the mighty force of

NITROGLYCERIN DYNAMITE

to drain it and put it in shape to bear crops.

Ditching with dynamite is the accepted method all over this state because it is easy, quick and quite inexpensive. No machinery—just a few sticks of dynamite. It does not require expert knowledge to handle explosives on the farm successfully, but if your project requires it we will send a Du Pont field representative to help you.

First write for our Farmers' Hand Book of Explosives, which has complete instructions, then see our local dealer.

A Good Threshing Rig Increases Your Profits

THE value of good plowing and planting is too often lost in wasteful threshing. A clean-threshing outfit that delivers 100% of your small grain may mean the difference between profit and loss this year. It will safeguard the time, labor and money you put into your land.

Take time to select a rig that will not only serve you well this year, but will last you for many years to come.

Look into the record of the E-B Geiser Thresher for the past 60 years. Then study its construction, simplicity, ease of operation, and grain-separating and grain-cleaning ability. Ask the E-B dealer in your neighborhood why grain from E-B Geiser Threshers brings more money, or write us for the facts.

THE TAXATION MUDDLE

In your editorial "Who Will Pay the Piper?" you state the following: "One of the biggest questions confronting Congress is that of tax revision. For months there has been persistent agitation, especially by the big interests, for relief from burdensome taxes."

You have summed up the situation pretty well, but you are mistaken in thinking that the big, or any other, interests want to be relieved of burdensome taxation. All that anybody seems to want, if uttered words and written expression mean anything, is merely the shifting of the burden from one set of shoulders onto some one else's shoulders, for, if this were not so and they really wanted a remedy for burdensome taxation, they would endorse the Single Tax Party's program to take the entire rent of land for public use and benefit, thus doing away with the necessity of taxing big or little business, industry or enterprise, incomes or inheritances, or countenancing any other form of robber taxation.

Rather than bring this up for discussion, Prof. Houston of Penn. and Adams of Yale, Farm Federations, Congress committees, newspaper and magazine editors and writers, prefer to still further muddy the waters of the already muddled taxation "Slough of Despond"—leaving the intelligent (?) American voter in a worse state than before—if that is possible.

If the Federal Government wants four billions of revenue and the state, county and local governments also have use for great revenues, why do not these various forms of government collect for their needs that which belongs to them as representatives of all the people—before asking useful producers and consumers to contribute?

The rent of land, if publicly collected, would more than meet the entire expenses of government of all kinds. It is the only fund to which government can justly and morally claim ownership, but government prefers to take the private property of the consumer, the income possessor, or the recipient of an inheritance. Any big or little interest caught doing the same thing would probably land in jail!—Oliver McKnight, Queen Anne Co., Md.

GARLICKY WHEAT PRICES

Last October I drew attention to the serious handicap the Maryland farmers were working under, in marketing their garlicky wheat. At that time No. 2 garlicky was selling for 22c discount under the No. 2 Red Western (free of garlic) grade. Later the discount narrowed to 5c, but in April, it again widened to 22c difference.

That such a ruinous discount of 22c should have ruled twice in six months time show, that the situation for this wheat is serious and should call forth real activity from our State Board of Agriculture along lines, that would broaden its outlet and thereby the producers secure prices nearer its real worth. The low ruling prices alone for this "high

cost produced wheat of itself is drastic enough, but when a further discount of 22c for the garlicky wheat is demanded, the situation calls strenuously for a correction.

Particularly so, when Prof. Symons of the State Rotation Service is quoted as stating, that seven-eighths of the Maryland wheat is classed as garlicky grade, and the Maryland State Marketing Committee estimates the loss at \$1,500,000, which looks reasonable when considered at the big discounts that have ruled for seven months past.

In April, when the difference was around 12 to 15c discount, quite a number of cars of this wheat, I am told, was shipped out of our Baltimore elevators to Philadelphia and vicinity, on a freight rate of 17c per hundred, while Philadelphia's market, I believe was holding nominally around 9c discount.

With probably 45 per cent of the Maryland crop still unsold, and the growing crop showing promise, the matter calls for quick relief.

I get it that the millers who use this No. 2 garlicky wheat in fair quantity calculate it is worth to them 5c discount at harvest time, and the fall months, and about 3c difference at this time of year. (The U. S. Grain Corporation held it at not over 2c discount while they had control). If the millers' views are correct, why should it now be selling at so much greater discount? Are not the wholesale winter wheat flour prices based on the garlicky wheat?—C. Bosley Littig, Maryland.

A WARNING

Dean Davenport, of Illinois, warns against wrong use of the Farm Bureau. It will be well to bear his remarks in mind, as quoted in the following:

"Temptation to misuse an organization such as the Farm Bureau, especially at a time like the present, is almost irresistible. Suffering under limitations and hardships of one kind or another, in which the individual finds himself powerless, why should not the farmer use his organization as others are using theirs for securing relief by the most direct and effective means? Simply because, if we use our best machinery for assault and battery, we shall find it spoiled for the later and more permanent, as well as more important, work of constructive development. As the farmer well knows, many a good monkey wrench has been spoiled by using it for a hammer."

"It may as well be written down as axiomatic that if this great organization is to do the work that needs to be done in and for agriculture it must never lose its temper and it must never lose the respect of its associated industries and interests. Not opposition and fighting, but conference and constructive planning must characterize the methods of this association which is altogether unique among masses of men. For our object is development of a great national industry and mode of life, not simply protecting the rights of a certain group of citizens, which are already guaranteed."—Market Growers Journal.

Of Interest to Farm Women and Girls

A Wide-Awake New Jersey Girl

GERTRUDE MOSCOVITZ has not only distinguished herself in her own county but in the state by the kind of club work which she has been doing for the past four years. We'll let her tell the story herself. What she has done other girls may do also.

"I joined a baking club in 1917 under the leadership of Miss Fannie Cooper, assistant state club leader. In the fall I took a loaf of bread to our county exhibit at Bridgeton, and won first prize, \$1.50.

"During the spring of 1918 Mr. Matlack, our county club leader, came to our school and explained the different projects to us, and I joined the garden club. My garden was a large general vegetable garden, and I kept accurate account of all I did. As a reward for my club work that year I received a certificate of achievement and a trip to the Agricultural College at New Brunswick. The trip was awarded to me for being first in the garden project work of the county.

"In 1919, when Mr. Archibald was county club leader, I joined the canning club and learned how to do cold-pack canning in demonstrations at our school. That summer I canned 219 jars, consisting of 51 varieties of fruits and vegetables. I sent a display of the canning I had done to the farmer's picnic that fall at Tumbling Dam Park, and received \$7.50 in money prizes.

"My canning display was then sent to the Trenton Fair, and there it received first prize in competition with others from various parts of the state. For the work I had done in this project I received another trip to Agricultural College.

"Last year, 1920, when Mr. Howard was county club leader, I again undertook the canning project, and canned 230 quarts of fruits and vegetables, with 85 varieties. Also I made 40 jars of 20 different kinds of jellies and jams. I sent a display to the farmers' picnic and received \$13 in prizes. I also sent a display to the Trenton Fair and won a number of individual prizes.

"Club work has made me want to take a course in home economics, so I am now taking school work in preparation for entering the home economics course at our state college.

The prize money I received is going to help pay my expenses.

"Boys and girls ought to be club members, not because of money prizes, but more on account of the interest and joy of the work."

Gertrude has also interested her whole family in club work. There are four children in the family, and every one is now a club member. Her brothers are in the garden project, and her two sisters are in the baking and cooking projects. Gertrude's club work has not only interested and helped her own family, but has been an inspiration to the community in which she lives. She has demonstrated in a very real way that it pays to be a good club member, and to finish well the tasks which you begin. She was requested to send two of her cans for the national exhibit at Washington, D. C. We are pretty proud of Cora in Cumberland County—Mrs. C. J. S., Cumberland County, N. J.

MILK ESSENTIAL TO CHILD HEALTH

Let us take up in detail the problem of food for children. The most important food for every child, whether in good health or malnourished, is milk. Children should have plenty of whole milk every day throughout the years of growth.

Milk contains the best quality of protein or tissue building and body repair material of any food we use. The protein in milk meets all the protein needs of the growing body, and is easily digested and very completely absorbed. It has the least tendency of any of the animal proteins to promote the growth in the digestive tract of the decay or putrefactive type of bacteria which cause digestive disturbances.

Milk is the richest food in lime, without which good bones and teeth cannot be built. Milk contains phosphorus, which is combined with lime in making bones and teeth. Milk has some, though not so much, iron as some other foods.

Milk contains all three of the body protective substances, called vitamins, which are so essential to the body's well-being, and, in the case of children are absolutely necessary for normal growth. Milk is one of

the best sources of supply for the fat-soluble A vitamin (found in the cream) and water-soluble B vitamin. It contains water-soluble C vitamin in moderate amount only. The A vitamin promotes growth, and prevents a certain form of eye weakness. The B vitamin promotes nerve health and appetite. Leafy vegetables and yeast are good sources of it. The C vitamin occurring in fresh, uncooked fruits and green vegetables, prevents scurvy. Milk also contains cream and sugar—two good fuel foods. Butter made from the cream of milk contains considerable of the A vitamin, and is the most desirable form of fat for children.

The child should have at the very least a pint of milk a day, and a quart a day is the best amount. Undernourished children should have not less than a quart of milk a day. Give them a glass in mid-morning and one in mid-afternoon, as well as at meals. If the child is in school, arrangements can be made for him to have the milk at school.

Many parents say that their children will not take milk. But if you get them interested in their health progress by means of their weight records from week to week, there is little difficulty in getting them to take milk. Give part of the necessary amount to them in milk soup, junket, custards and milk desserts, etc.

Eggs should also be a part of the child's diet. An egg a day, if possible, or at least every other day. The protein in eggs, like that in milk, is efficient for building and repairing tissues. Eggs have but little lime, except in the shell, but they are rich in iron, and have considerable phosphorus and other minerals so valuable in nutrition.

Eggs may be soft cooked, poached, coddled, steamed, baked, or made into omelet, but do not fry them for feeding to children.

Vegetables Are Important. Vegetables are especially important for feeding to children, because of the mineral matter, vitamins and fiber which they supply.

Spinach is particularly rich in iron, so necessary in making healthy red blood.

Leafy vegetables, such as spinach, chard, kale, Brussels sprouts, dandelions, beet tops, lettuce, cabbage and the leaves of any plants used for food contain a great deal of fat-soluble A vitamin, found so largely in butter and cream. This ranks leafy vegetables with milk and eggs so far as the vitamin protective substances are concerned.

In general, vegetables also furnish water-soluble B and C vitamins, so necessary for maintaining nerve vitality, tomatoes being especially rich in water-soluble C vitamin. This C vitamin, which prevents scurvy, is more sensitive to heat than the other two vitamins, but does not seem to be destroyed by heat in the cooked or canned tomato, as in other cooked or canned fruits and vegetables. The tomato acid is believed to be the agent which preserves the vitality of the vitamin in the presence of heat.

Because the C vitamin is so sensitive to heat is one reason for providing some fresh uncooked vegetables and fruit in the children's diet during all seasons of the year.—Pearl MacDonald.

A kitchen cabinet is all right, but if I must choose between the two, give me a high stool where its handy, says one housewife.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

LADIES' AND MISSES' SUMMER DRESSES

3592.—Daughter Will Like This Model.—The pattern is cut in 3 sizes, 16, 18 and 20 years. An 18-year size will require 5 yards of 40-inch material. The skirt shows new style lines, and the blouse is a very pleasing model. The width of the skirt at the foot is 2 yards. Satin, linen, pongee, gingham, taffeta, etamine, foulard and satin are attractive for this style. Pattern, 10 cents.

3599-3606.—Smart Sports Costume.—The blouse is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 3 yards of 36-inch material for a 38-inch size. The skirt is cut in 6 sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. A 28-inch size will require 3 yards of 44-inch material if cut crosswise, and 2 1/2 yards if cut lengthwise of the goods. Wash satin, serge, linen, gingham, cretonne or chintz could be used for this style. Combinations of material are attractive for it. The waist may be finished with long or short sleeves. The width of the skirt at the foot is about three yards. This illustration calls for two separate patterns at 10 cents each.

3616.—A Pretty Summer Dress.—The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size will require 5 1/2 yards of 44-inch material. The width of the skirt at the foot is 2 1/2 yards. Embroidered crepe or duvetyn, printed georgette or crepe, taffeta, linen, voile, pongee, gingham, organdie, etamine and crepe de chine are attractive for this style. Pattern, 10 cents.

3618.—A Stylish One-piece Dress.—The pattern is cut in 3 sizes: 16, 18 and 20 years. An 18-year size will require 3 1/2 yards of 54-inch material. Gabardine, crepe, mohair, duvetyn, pongee, linen, satin, foulard and taffeta will be attractive for this model. The dress may be finished with a fitted sleeve or one short and flowing. The width of the skirt at the foot, with plaits extended, is 2 yards. Pattern, 10 cents.

POULTRY

MODERN POULTRY HOUSES

Old farm poultry houses can frequently be modernized by simple changes in the arrangement of the windows and the construction of the floor. If the windows are all of glass take out half of them and cover the openings with quarter-inch mesh wire. The will keep out sparrows and if nailed tightly on the inside it will be as much protection from thieves as glass windows.

The open front house furnishes ventilation and keeps the floor more dry. Closed houses are damp and the damp poultry house is a cause of colds and roup. Keep the glass windows clean so that the sunlight will enter and keep the litter in as sanitary condition as possible.

Old earth floors are often unclean. The dirt is soon scratched into the litter and the air in the poultry house soon becomes bad when the hens are working for their scratch feed. Often it will pay to remove the old dirt and construct a solid foundation of sand, stone or cinders. Then a cement floor can be laid at a height from the outside ground so that moisture will be excluded. This cement floor will enable the poultrymen to clean the house quickly. It will keep out rats and weasels.

Sometimes a wooden floor can be built in the old poultry house to insure more dry conditions for the birds. But lumber is high and the stone floor is more practical. If a floor of lumber is used, the outside foundation of the house should be of cement to keep out rats. A farm poultry house with a good floor and plenty of windows is apt to be a satisfactory house if it is properly managed.—R. G. K.

MEND POULTRY HOUSE ROOFS

Nothing places the litter in a poultry house in unsanitary condition quicker than a leaky roof. Litter that is dry will absorb quite a lot of dirt but wet litter means a damp ill-smelling house and this may bring colds and other diseases to the hens.

It pays to keep a bale of shingles on hand and slip in new ones when small holes appear in the roof. Roofing paper may be torn in storms. We find that patches should be made at once or an entire strip may be torn loose by being whipped in the wind. The seams where the strips join should be sealed with tar or one of the commercial preparations sometimes furnished with the rolls of paper.

Roofing paper will sometimes break loose at the seams because the nails have worked out. About every other year it pays to paint over the seams where the nails are placed and this seems to seal them and keep the nails from working out. This is also practical all over houses that are covered with roofing paper on all sides.

Roofing paper is most easily placed on a warm still day. Then the paper flats out nicely against the roof and it can be quickly nailed down. On a windy day it is difficult to do a neat job and much time is wasted trying to keep the paper in place. We find it pays to use good

quality roofing paper on poultry houses. At present the cost of labor is large and it is a satisfaction to have a roof that is good for ten years of service or more.

We find that galvanized nails are the most satisfactory for nailing roofing paper as they do not rust out quickly.—R. G. K.

POULTRY NOTES

The fact that eggs have been so cheap this spring should be an added incentive to cull flocks carefully and keep the birds which have prospects as fall and winter layers. The poultryman who can only sell fresh eggs in the spring when the storage companies are stocking up at a low price, will not make much money. But when the storage companies are unloading next fall and winter and there are few eggs being sold from general farms, it pays to have fresh eggs to sell and they usually bring quite a satisfactory price regardless of how cheap they may have been during the preceding spring.

If poultrymen are either optimists or pessimists according to the advice they receive they will always be unsettled. Every man has to know his own business and steer his own course. He cannot be blown about by every rumor he hears. It pays best to keep a business on a safe basis at all times and not overproduce when prices seem very good or cease production at the first word of a slump. The business men who have an aim and do the best they can and do much of their own work seem to get along best.

Poultry profits are not so large that equipment can be mistreated. Its cost must be divided among many crops of chicks. Clean and drain the incubators and store them in a dry place. Scrape the rust from stove brooders and wipe all parts with an oiled rag. Take the brooders from the houses as soon as they are not needed and they will be easier to clean. Brood coops will last longer if piled in a dry shed when the chicks are weaned and roosting in larger houses. Gather up the sanitary fountains for next year. Poultry hardware costs money and the dishes are soon lost if allowed to be kicked around the farm all summer.

Buyers of hatching eggs should test them for fertility and then report promptly to the producer if those eggs show a poor per cent of fertility. If the buyer kicks on the fertility of the eggs when the chicks ought to be several weeks old there is always the suspicion that the buyer had bad luck with the chicks and is trying to get more free. However most buyers are honest and such experiences do not often occur.

If a buyer has had luck with a setting of eggs bought of an honest breeder, that buyer should not be too severe in his letter to the breeder. Sometimes a poor hatch may result from jostling during transportation or from other causes beyond the control of the producer. A seller of eggs must be a gentleman in dealing with a buyer even if the buyer is unreasonable and unjust in his accusations.—R. G. K.

Lowe Brothers

Made mostly for women—but used by many men

It was made for women from 14 to 74. It was made by a woman, and put together by a man. It's color is blue, because it stands for happiness. It's name is the Happy Happening, because it makes happiness happen. Makes it happen to homes, either inside or out. Among 98 other things, it has to do with Mother's kitchen and Father's automobile.

It costs you nothing, but its bound to save you much. It's one of those things it is best not to borrow, because you will never want to return it.

If you will send us 10 cents with your name and address, and just say: "Send the Happy Happening"; along will come one of your own by return mail.

"Rat-Snap Kills 48 Rats"

Writes Irvin Nerhood, Pennsylvania: "After using one large package, we counted 48 dead rats." RAT-SNAP kills em, dries up the carcass, and leaves no smell. Cats and dogs won't touch it. Comes in convenient size cakes, so mixing with other food. Get a package today. Three sizes: 35c for kitchen or cellar; 65c for chicken house or corn crib; \$1.25 for barns and outbuildings. Your money back if RAT-SNAP doesn't do the work. KILLS RATS - LEAVES NO SMELL. RAT-SNAP. As all drug and hardware stores.

YUILL'S EXTERMINATING CO., Westfield, N. J.

FARM WAGONS

High or low wheels—steel or wood—wide or narrow tires. Weigh parts of all kinds. Wheels to fit any running gear. Catalogs sent free. Electric Wheel Co., 68 Elm St., Quincy, Ill.

U.S. Army Last Shoe

GUARANTEE 6 months. Made of pliable leather. Lasts long. Broad Solid Oak leather. If it is a Double Thick Sole, dirt and water proof. Lasts 12 to 15 months. GUARANTEE You must be entirely satisfied or we will refund your money.

Pay Postman Send us money just as you send your money. Send your name, address and size. Your shoes will be sent by return mail. Pay postman \$1.45 and we will send you a pair. CIVILIAN ARMY & NAVY SHOE CO. Dept. 238 461 3th Ave., New York

BINDER TWINE

Farmers get our low factory price and save money. Acacia twine! Samples free. THEO. BURT & SONS, MELROSE, OHIO.

THE PREMO Jr. CAMERA

The Premo, Jr. Model B, is well made, substantial and reliable. It makes pictures 2 1/2 x 3 1/2 inches in size and the negatives are of such quality that excellent enlargements can be made from them. It will produce first-class results in all ordinary amateur photographic work, such as snapshots in good light, time exposures, home portraits, landscape and street photography. A complete book of instructions is included with each one.

How to Earn This Reward

Call on a few of your neighbors and tell them you are getting up a club of subscribers for Pennsylvania Farmer to earn a Camera. They will be glad to help you. Send us 4 subscriptions for the balance of this year and all of next or to Jan. 1, 1923, at 75 cents each and we will forward you a Camera by prepaid post. Subscriptions may be new or renewal. Reward No. 102.

PENNSYLVANIA FARMER, 261 S. Third Street, Philadelphia, Pa.

Plenty of Dairy Foods Promote the Good Health of Boys and Girls

The Valley of the Giants

By PETER B. KYNE

Chapter VI

Synopsis—John Cardigan, a middle-aged man—a giant in frame and mind—was a pioneer settler along the Pacific coast in Humboldt County, California, in 1850. His business was cutting the giant trees into lumber. His young wife died and was buried among the redwoods in "The Valley of the Giants," as he called the spot which he loved and reserved as a shrine to her memory. Bryce, Cardigan's only son, was an intimate friend of his father—who planned that he should inherit the great lumber business which he had built up. Bryce had a brief love affair with Shirley Sumner, a sister to the neighborhood, but she was soon forgotten and he refused to be lured into raising his offer for it. He determined to move his mill to the San Hedrin watershed and start logging operations there. Bryce, after four years of college in the East, and two years of travel abroad returned to Sequoia. He was met at the train by George Sea Otter. Bryce decided to invest in a young woman who got off the train with him and found no one to meet her.

THE Highest Living Authority, following the gaze of the baggage-smasher, turned and beheld George Sea Otter. Beyond a doubt he was of the West westward. She had heard that California stage-drivers were picturesque fellows, and in all probability the displacing of the old Concord coach of the movie-theater in favor of the motor-stage had not disturbed the idiosyncrasies of the drivers in their choice of raiment. She noted the rifle-stock projecting from the seaboard, and a vision of a stage hold-up flashed across her mind. Ah, yes, of course—the express messenger's weapon, no doubt! And further to clinch her instant assumption that here was the Sequoia motor-stage, there was the pennant adorning the wind-shield!

Dismissing the baggage-smasher with a gracious smile, the Highest Living Authority approached George Sea Otter, noting, the while, further evidence that this car was a public conveyance, for the young man who had been her fellow-passenger was heading toward the automobile also. She heard him say:

"Hello, George, you radiant red rascal! I'm mighty glad to see you. Shake!"

They shook. George Sea Otter's dark eyes and white teeth flashing pleasantly. Bryce tossed his bag into the tonneau; the half-breed opened the front door; and the young master had his foot on the running-board and was about to enter the car when a soft voice spoke at his elbow:

"Driver, this is the stage for Sequoia, is it not?"

George Sea Otter could scarcely credit his auditory nerves. "This car?" he demanded bluntly. "This—the Sequoia stage? Take a look, lady. This here's a Napier imported English automobile. It's a private car and belongs to my boss here."

"I'm so sorry I slandered your car," she replied demurely. "I observed the pennant on the wind-shield, and I thought—"

Bryce Cardigan turned and lifted his hat.

"Quite naturally, you thought it was the Sequoia stage," he said to her. He turned a smoldering glance upon George Sea Otter. "George," he declared ominously, but with a sly wink that drew the sting from his words, "if you're anxious to hold down your job the next time a lady speaks to you and asks you a simple question, you answer yes or no and refrain from sarcastic remarks. Don't let your enthusiasm for this car run away with you." He faced the girl again. "Was it your intention to go out to Sequoia on the next trip of the stage?"

She nodded.

"That means you will have to

wait here three days until the stage returns from Sequoia," Bryce replied.

"I realized, of course, that we would arrive here too late to connect with the stage if it maintained the customary schedule for its departure," she explained, "but it did not occur to me that the stage-driver wouldn't wait until our train arrived. I had an idea his schedule was rather elastic."

"Stage-drivers have no imagination, to speak of," Bryce assured her. To himself he remarked: "She's used to having people wait on her."

A shade of annoyance passed over the classic features of the Highest Living Authority. "Oh, dear," she complained, "how fearfully awkward! Now I shall have to take the next train to San Francisco and book passage on the steamer to Sequoia—and Marcelle is such a poor sailor. Oh, dear!"

Bryce had an inspiration and hastened to reveal it.

"We are about to start for Sequoia now, altho the lateness of our

start will compel us to put up to-night at the rest-house on the south fork of Trinity River and continue the journey in the morning. However, this rest-house is eminently respectable and the food and accommodations are extraordinarily good for mountains; so, if an invitation to occupy the tonneau of my car will not be construed as an impertinence, coming as it does from a total stranger, you are at liberty to regard this car as to all intents and purposes the public conveyance which so scandalously declined to wait for you this morning."

She looked at him searchingly for a brief instant; then with a peculiarly winning smile and a graceful inclination of her head she thanked him and accepted his hospitality—thus:

My Punishment

I don't believe you'd ever guess
My mother's punishment for me,
When I have done a hateful thing,
And been as bad as I can be.

She doesn't lock me in my room,
Or take away my favorite toy,
And leave me till I've promised her
That I will be a better boy.

She doesn't punish with a whip,
Altho some other mothers do;
Some kinds of boys are helped by
that,

But I get madder thru and thru.

No sir! My mother simply says,
"My son, go out and take a walk
Into the quiet of the woods,
Where you and God can have a talk."

Tell Him both sides, both yours
and mine,
He is a judge, you need not
fear.

Talk freely, for I know that He
Will make the right and wrong
quite clear."

So off I start. In winter days
I bundle up—but out I go,
And pretty mad, I'll tell you that,
At least at first it's aways so.

But somehow, when I've gotten
there
The woods are all so still and dim,

quoia now, altho the lateness of our

start will compel us to put up to-night at the rest-house on the south fork of Trinity River and continue the journey in the morning. However, this rest-house is eminently respectable and the food and accommodations are extraordinarily good for mountains; so, if an invitation to occupy the tonneau of my car will not be construed as an impertinence, coming as it does from a total stranger, you are at liberty to regard this car as to all intents and purposes the public conveyance which so scandalously declined to wait for you this morning."

She looked at him searchingly for a brief instant; then with a peculiarly winning smile and a graceful inclination of her head she thanked him and accepted his hospitality—thus:

She looked at him searchingly for a brief instant; then with a peculiarly winning smile and a graceful inclination of her head she thanked him and accepted his hospitality—thus:

"Why, certainly not! You are very kind, and I shall be eternally grateful."

"Thank you for that vote of confidence. It makes me feel that I have your permission to introduce myself. My name is Bryce Cardigan, and I live in Sequoia when I'm at home."

"Of Cardigan's Redwoods?" she questioned. He nodded. "I've heard of you, I think," she continued. "I am Shirley Sumner."

"You do not live in Sequoia."

"No, but I'm going to hereafter. I was there about ten years ago."

He grinned and thrust out a great hand which she surveyed gravely for a minute before inserting hers in it.

"I wonder," he said, "if it is to be my duty to give you a ride every time you come to Sequoia? The last time you were there you wheeled me into giving you a ride on my pony, an animal known as Midget. Do you, by any chance, recall that incident?"

She looked up at him wondering. "Why—why, you're the boy with the beautiful auburn hair," she declared. He lifted his hat and revealed his thick thatch in all its glory. "I'm not so sensitive about it now," he explained. "When we first met, reference to my hair was apt to rile me." He shook his little hand with cordial good-nature. "What a pity it wasn't possible for us to re-

company. I'll drive; and you can sit up in front with me, Miss Sumner, snug behind the wind-shield where you'll not be blown about."

"I'm sure this is going to be a far pleasanter journey than the stage could possibly have afforded," she said graciously as Bryce slipped in beside her and took the wheel.

"You are very kind to share the pleasure with me, Miss Sumner," he went thru his gears, and the car glided away on its journey. "By the way," he said suddenly as he turned west toward the distant blue mountains of Trinity County, "how did you happen to connect me with Cardigan's redwoods?"

"I've heard my uncle, Colonel Seth Pennington, speak of them."

"Colonel Seth Pennington means nothing in my young life. I never heard of him before; so I dare say he's a newcomer in our country. I've been away six years," he added in explanation.

"We're from Michigan. Uncle was formerly in the lumber business there, but he's logged out now."

"I see. So he came West, I suppose, and bought a lot of redwood timber cheap from some old croaker who never could see any future to the redwood lumber industry. Personally, I don't think he could have made a better investment. I hope I shall have the pleasure of making his acquaintance when I deliver you to him. Perhaps you may be a neighbor of mine. Hope so."

At this juncture George Sea Otter, who had been an interested listener to the conversation, essayed a grunt from the rear seat. Instantly, to Shirley Sumner's vast surprise, her host grunted also; whereupon George Sea Otter broke into a series of grunts and guttural exclamations which evidently appeared quite intelligible to her host, for he slowed down to five miles an hour and coked one ear to the rear; apparently he was profoundly interested in whatever information his henchman had to impart. When George Sea Otter finished his harangue, Bryce nodded and once more gave his attention to tossing the miles behind him.

"What language was that?" Shirley Sumner inquired, consumed with curiosity.

"Digger Indian," he replied. "George's mother was my nurse, and he and I grew up together. So I can't very well help speaking the language of the tribe."

They chattered volubly on many subjects for the first twenty miles; then the road narrowed and commenced to climb steadily, and thereafter Bryce gave all of his attention to the car, for a deviation of a foot from the wheel-rut on the outside of the road would have sent them hurtling over the grade into the deep timbered canons below. Their course led thru a rugged wilderness, wide-ly diversified and transcendently beautiful, and the girl was rather glad of the opportunity to enjoy it in silence. Also by reason of the fact that Bryce's gaze never wavered from the road immediately in front of the car, she had a chance to appraise him critically while pretending to look past him to the tumbling, snow-covered ranges to their right.

She saw a big, supple, powerful man of twenty-five or six, with the bearing and general demeanor of one many years his elder. His rich, dark auburn hair was wavy, and a curling lock of it had escaped from the band of his cap at the temple; his eyes were brown to match his hair and were the striking feature of a strong, rugged countenance, for they were

new acquaintance on the train, Miss Sumner."

"Better late than never, Mr. Cardigan, considering the predicament in which you found me. What became of Midget?"

"Midget, I regret to state, made a little pig of herself one day and died of acute indigestion. She ate half a sack of carrots, and knowing full well that she was eating forbidden fruit, she bolted them, and for her failure to Fletcherize—and speaking of Fletcherizing, did you dine aboard the train?"

She nodded. "So did I, Miss Sumner; hence I take it that you are quite ready to start."

"Quite, Mr. Cardigan."

"Then we'll drift, George, suppose you pile Miss Sumner's handbaggage in the tonneau and then pile in there yourself and keep Marcelle

company. I'll drive; and you can sit up in front with me, Miss Sumner, snug behind the wind-shield where you'll not be blown about."

"I'm sure this is going to be a far pleasanter journey than the stage could possibly have afforded," she said graciously as Bryce slipped in beside her and took the wheel.

"You are very kind to share the pleasure with me, Miss Sumner," he went thru his gears, and the car glided away on its journey. "By the way," he said suddenly as he turned west toward the distant blue mountains of Trinity County, "how did you happen to connect me with Cardigan's redwoods?"

"I've heard my uncle, Colonel Seth Pennington, speak of them."

"Colonel Seth Pennington means nothing in my young life. I never heard of him before; so I dare say he's a newcomer in our country. I've been away six years," he added in explanation.

"We're from Michigan. Uncle was formerly in the lumber business there, but he's logged out now."

"I see. So he came West, I suppose, and bought a lot of redwood timber cheap from some old croaker who never could see any future to the redwood lumber industry. Personally, I don't think he could have made a better investment. I hope I shall have the pleasure of making his acquaintance when I deliver you to him. Perhaps you may be a neighbor of mine. Hope so."

At this juncture George Sea Otter, who had been an interested listener to the conversation, essayed a grunt from the rear seat. Instantly, to Shirley Sumner's vast surprise, her host grunted also; whereupon George Sea Otter broke into a series of grunts and guttural exclamations which evidently appeared quite intelligible to her host, for he slowed down to five miles an hour and coked one ear to the rear; apparently he was profoundly interested in whatever information his henchman had to impart. When George Sea Otter finished his harangue, Bryce nodded and once more gave his attention to tossing the miles behind him.

"What language was that?" Shirley Sumner inquired, consumed with curiosity.

"Digger Indian," he replied. "George's mother was my nurse, and he and I grew up together. So I can't very well help speaking the language of the tribe."

They chattered volubly on many subjects for the first twenty miles; then the road narrowed and commenced to climb steadily, and thereafter Bryce gave all of his attention to the car, for a deviation of a foot from the wheel-rut on the outside of the road would have sent them hurtling over the grade into the deep timbered canons below. The Adams Motor Trailer

An efficient, easily-attached motor car trailer of sturdy but light construction; suitable for all-around-use. Light, well balanced and carefully designed, instantly attachable to your motor car by a special easily-fitted coupling device, it will go anywhere your car will go. The basic chassis is well adapted to any form of body design.

Save Money
With the Adams Trailer, you can use the surplus power otherwise wasted in motor car operation, giving added profits in saved time and labor. It is a durable, economical, serviceable, dependable vehicle of very low upkeep, that will pay for itself in a very short time. Capacity 1,500 lbs. You will find it the handsomest vehicle in your garage, and indispensable on the farm.

User Representatives Wanted
We want representation in every part of the United States. Write for our special representative's proposition, by which you can buy your trailer at a special discount, become our representative in your locality and build up a profitable business for yourself. Easy to sell. Labor and power saving features seen at a glance. No trouble to demonstrate. Small initial investment. Quick profits. Prices, discounts and full information on request. Write today.

A Story for Children

Louise's Dream

"O H-OH-OUCH," screamed little Louise, as one after another, Nurse untangled the knots in her hair.

"Don't wiggle so and it won't hurt nearly so badly. Now go and wash your face and hands. Quickly now, for it is after eight o'clock. I will turn back your bed covers and wait for you."

When Nurse's back was turned Louise dabbed her hands in the water then wiped them on the towel. A few minutes later, she jumped into bed and her mother came to kiss her goodnight. As she was leaving she noticed her daughter's dirty hands and face.

"Why, Louise, dear," she said, "look at your hands."

"Oh, Mother, I don't see why we have to be so clean, and have so much hair. I wish I were a bird or something. Then I wouldn't have to bother."

Once again Louise was having her hair combed, when a little fairy stepped before her.

"Do you really want to be an animal, it asked.

"May I?" asked Louise eagerly.

"Of course. What would you like to be?" When you decide you may have three wishes."

"Wait a minute," called Louise, "the fairy started away. But it was gone."

As she was walking along the road she saw a bird happily hopping about.

"Oh, I wish I were a bird," she said aloud.

No sooner had she said it than she became a robin. The funny part of it was, she still could think like a girl, and she was so surprised, that she almost pounced upon her. She

was merely a clever pose and sustained with difficulty. She was con-firmed in this assumption when, after sitting with him a little on the porch after dinner, she complained of being weary and bade him good-night. She had scarcely left him when he called:

"George!"

The half-breed slid out of the darkness and sat down beside him. A moment later, thru the open window of her room just above the porch where Bryce and George Sea Otter sat, Shirley heard the former say:

"George, when did you first notice that my father's sight was beginning to fail?"

"About two years ago, Bryce."

"What made you notice it?"

"He began to walk with his hands held out in front of him, and sometimes he lifted his feet too high."

"Can he see at all now, George?"

"Oh, yes, a little bit—enough to make his way to the office and back."

"Poor old governor! George, until you told me this afternoon, I hadn't heard a word about it. If I had, I never would have taken that two-year jaunt around the world."

George Sea Otter grunted. "That's what your father said, too. So he wouldn't tell you, and he ordered everybody else to keep quiet about it. Myself—well, I didn't want you to go home and not know it until you met him."

DELAWARE NOTES

Farmers all over the country are becoming deeply impressed with the necessity of organization to protect their interests and to make farming more of a stable business and less of a gambling proposition. The unorganized farmer is the greatest gambler in the world. As a general thing he does not make an adequate profit if any, as the result of his season's work and responsibility.

Yet the consumer benefits nothing by the exploitation of the farmer. The consumer pays as much or more for the farmer's products as he would have to pay were the farmer organized and able to protect his legitimate interest and reap an adequate profit for the labor and care he has sown with his seed. Organization of farmers, such as is going on all over the country, especially in Delaware, will have no adverse effect on the consumers of the farmer's product. Rather it will benefit all classes by increasing the farmer's prosperity and enabling him to become a greater consumer as well as a producer.

Where farmers' organizations have been successfully launched and carried thru the whole community has benefited. They cannot afford to continue to produce food and other commodities for the nation at a loss. They propose that a greater percentage of the price the consumer pays shall go to the producer and less to the middlemen. They will effect that reform, without harm to the consumers, thru organization.—Elsie W. Massey, Sussex Co., Del.

COUNTY NOTES

Lancaster Co., Pa.—The farmers in this section as a rule were not in a hurry about planting corn; some planted earlier but the bulk of the corn was planted after the 15th of May. Some was planted as early as April 15th. Some tobacco was planted as early as May 2d and some has been planted since, but this is exceptional. June first to 15th is popular planting time.

Fruit is the next thing to a total failure but an occasional tree may be found having a few apples. The same applies to peaches, sour cherries or pears. The prospect for berries, such as blackberries, raspberries, and strawberries is good. Potatoes are coming up somewhat irregularly. No complaint of rot in the early planted corn. Grass looks well. Fat cattle moving off slowly at prices around 8 cents. The help question is not bothering the farmers much, help is more plentiful and wages are lower than last year.—J. B. Moore.

SUFFOLK CO. TO HAVE POTATO TOUR

One of the biggest gatherings of farmers ever witnessed in the history of New York's Sunrise County is expected when the potato growers gather for the fourth annual tour, which is to take place on Wednesday, June 29, and Thursday, June 30th. Invitations and announcements are being sent to many sections of the country and the indications are already that the number of visiting seed potato growers, college and extension specialists and other agricultural workers from New York State, Canada, Maine, Vermont, New Jersey, Connecticut and other sections of the country will exceed that of any previous year.

I am the CHAMPION

patented shock absorber, designed to make motoring a comfort and to reduce operating costs by conserving the investment in your car.

I operate both ways, up and down, eliminating the shock and absorbing the rebound.

I am correct in principle, simple in construction, faultless in operation and can be installed without extra attachments, within one hour.

I am endorsed by automotive engineers all over the country and to prove to you the above statements I offer myself for a ten day free trial.

Ask your dealer about me. He will see that I am attached to your car; and you will be rewarded with my incomparable, everlasting service.

The Wheat Situation in America

A Review of Forty Years of Wheat Prices and Production

By Dr. CLYDE L. KING

Wharton School of Finance and Commerce, University of Pennsylvania

HAS the farmer in this country received a price for wheat for the past forty years sufficient to meet the rapidly expanding needs of our growing city populations?

Just what is the situation as to the production of bread cereals in the United States, as compared with corn and other grain cereals?

It is a matter of common knowledge that the United States is rapidly becoming urbanized. City populations are growing far more rapidly than country populations. Is the production of wheat keeping pace with the growth of city populations?

In 1890, 63.9 per cent of the population in the United States was rural; by 1920 but 48.1 per cent was rural.

The seventeen states with the largest wheat area in 1920 were in order of their acreage: Kansas, North Dakota, Nebraska, Minnesota, Oklahoma, South Dakota, Illinois, Missouri, Washington, Ohio, Indiana, Montana, Pennsylvania, Colorado, Texas, Oregon, Idaho.

In each of these seventeen leading wheat producing states the per cent of rural population declined quite as rapidly as did the rural population of the country as a whole. By 1920 less than half the population of five of these seventeen states lived in the country.

In Illinois by 1920 but 32.1 per cent of the population was rural; in Pennsylvania but 35.7 per cent; in Ohio 36.2 per cent; in the State of Washington, 44.8 per cent; in Indiana 49.4 per cent. Oregon (50.1 per cent) and Colorado (51.8 per cent) were just about half rural. Kansas 80.9 per cent rural in 1890, was but 65.1 per cent rural in 1920 and Idaho, 72.4 per cent rural in 1920, was 100 per cent rural thirty years ago. The rural population in Kansas was actually smaller in 1920 (1,151,293) than it was in 1890 (1,155,907) while the city population had more than doubled. This was true also of Illinois. Her rural population was 2,079,602 in 1920, as compared with 2,116,180 in 1890, while her city population increased from 1,710,172 in 1890 to 4,405,678 in 1920. Indiana and Ohio show the same trend to the cities as do Kansas and Illinois. About the same thing was true of Missouri. Her rural population declined from 1,822,219 in 1890 to 1,817,152 in 1920 during which time her city population increased from 856,966 to 1,586,903.

Forty years ago the following five states led in wheat production in this country: California,

Kentucky, Michigan, Iowa and Tennessee.

Of the five states that led in wheat production 40 years ago, California is now but one-third (32 per cent) rural and Michigan's population but

the seventeen leading states will in the next few years decline relatively as other crops increase in acreage.

In the first chart on Page Two I have shown the relative increase in—

(1) The gross production of wheat in the United States.

(2) The gross production of wheat in the world.

(3) The trend toward a decrease in the exports from the United States, 1880-1918.

(4) The trend toward increasing the per capita consumption of wheat in the United States.

In all these instances the average of the years 1890-1899 is taken as equal to one hundred and each of the forty years is expressed in terms of this one hundred. The per capita consumption is the total production of wheat in this country plus imports, less exports, divided by the total population.

This chart indicates that:

(1) There has been a gradual increase in the total wheat production in the United States from 1880 to 1920. The total production of wheat was 96 per cent in 1880 and 97 per cent in 1882 of the average production in the years 1890 to 1899, inclusive, and 197 per cent in 1915—the highest year—and 119 per cent in 1911, the lowest year, in the last decade.

(2) The production per capita, however, as shown in the chart on Page Two tells another story. Per capita production just about averaged the same from 1890 to 1920 as it was from 1890 to 1900, while all three decades are slightly below the average per capita production for the first half of the decade from 1880 to 1890.

(3) While per capita production is just about holding its own, per capita consumption is tending to increase. Thus, in 1919, the per capita consumption was 144 per cent of what it averaged from 1890 to 1899; in 1918 it was 131 per cent; in 1917, 110 per cent; in 1915, 168 per cent; in 1914, 121 per cent; in 1913, 136 per cent; in 1912, 131 per cent; in 1911, 123 per cent. In 1916, only, in the past ten years, was the per capita consumption (96 per cent) below the average for 1890-1900.

While our wheat production has been, therefore, just about keeping pace with our growth in population for the last forty years production has decidedly not increased as rapidly as has per capita consumption. Inasmuch as we are an

Great Expectations

38.9 per cent rural. Kentucky and Tennessee are still three-fourths rural, but have turned their attention to other crops. Crop diversification has come to be the rule in all these five states. This same tendency is characteristic of many of the seventeen states now leading in wheat production. It is to be expected, therefore, that the proportional acreage put into wheat in each of

exporting country, and since we produce but about one-fifth of the total world supply of wheat, the price of wheat in the United States is dependent more upon total world production than total production in this country. Moreover, the price in each and every month will vary with producing conditions elsewhere. For every month in the year brings its harvest of wheat in two or more countries of the world.

(4) The increase in the gross production of wheat in the United States has just about kept pace with the increase in the total production of the world up to the war period. The relative world production is given for 1891 to 1916.

(5) Our relative exports, save during the war period, markedly declined. In other words, while our per capita wheat production has been fairly constant for forty years, our per capita consumption has increased and hence the relative exports have declined. The spurt in exports during the war was due to change in cereal consumption in this country to meet the needs of the Allies, and is, no doubt, therefore, temporary, for people will inevitably go back to wheat consumption.

(6) The per capita consumption of wheat has been increasing. This has been due to the keeping powers of wheat as compared with other flours and to the American taste for good white bread.

Chart No. 2 compares the crop acreage of the five main cereals in the United States in millions of acres for each of the past forty years. The largest acreage is in corn, then follows wheat, oats, barley and rye, respectively.

The chart reveals that:

- (1) The actual acreage in rye shows little change, save for the war years.
- (2) There has been a small but steady increase in the acreage of barley.
- (3) The acreage in oats has been more than doubled.
- (4) The acreage in corn has almost trebled.
- (5) The acreage in wheat increased around one-fourth, relatively little, as compared with corn and oats.

Corn and oats have gained in acreage far more rapidly than have the bread cereals, wheat and rye.

This is very significant for corn and oats are consumed locally. Our local consumption is expressed in the trend toward the raising of meat animals on small farms rather than on the plains as of yore. This is having its effect on the transportation question as well as on the trend toward diversification of our agricultural industries.

In chart No. 3 I compare:

- (1) The relative per capita production of wheat in each year from 1880 to 1920 with:
- (2) The price in cents per bushel as of December 1st of each year;
- (3) The relative population that is rural;
- (4) The relative decrease in the rural population of the country, and;
- (5) The purchasing power of wheat.

The chart shows:

(1) The per capita production has remained about the same since 1885 but below what it was in 1880. The relative per capita production was 103 in the last decade as compared with 105.1 from 1880 to 1889, inclusive. (The yield per acre has slightly increased being about 10 per cent for the last decade over the base decade of 1880 to 1889, inclusive).

(2) The per capita production has not kept pace with the actual increase in the rural population. In other words the rural population are

not as a rule going into wheat production. It may be that part of this is due to the use of machinery rather than labor in the production of wheat. Even in that instance the investment is heavier and hence the importance of the declining purchasing power of wheat is of no less significance than when the price of wheat represented a slight peak in the war period and then this peak was but slightly above the high peak of the last half of the decade 1890-1900. More significant still the purchasing power of wheat on December first last was the lowest that it has ever been in this forty-year period. The purchasing power of wheat, it will be noticed, runs about the same as does the per capita production of wheat. Neither have increased in the forty-year period. The price received by farmers for wheat has been based on the cost of producing wheat in new and unused lands in the West and not on the cost of producing wheat on older lands where fertilizers have to be used and where labor costs were higher.

CHART NO. 1—The relative increase in the production of wheat in the United States, the production of wheat in the world, the exports of wheat from the United States and the per capita consumption of wheat in the United States 1880-1920. The average of the years 1890-1899, inclusive, is taken as equal to one hundred.

CHART NO. 2—The crop acreage of corn, wheat, oats, barley and rye in millions of acres, 1880-1920

CHART NO. 3—Relative per capita production of wheat in the United States, the relative price in cents per bushel as of December first each year, the relative purchasing power of the wheat 1880-1920. (The average of the years 1890-1899 inclusive is taken as equal to one hundred for the per capita production of wheat, the relative price per bushel and the purchasing power of the wheat dollar. The Census in 1890 is taken as equal to one hundred for the actual per cent of the population that is rural and for the relative decrease of the rural population as compared with 105 total population of the United States)

sent wages primarily.

(3) While per capita production of wheat has remained constant and the average yield per acre has increased but slightly the per cent of our total population that is rural has been gradually declining. Wheat production, that is, has been increased by the use of machinery and sea-

sonal and home help, and not by increasing the rural population itself.

(4) The purchasing power of wheat (1890-1920) was determined by dividing the price of wheat by the index number for all commodity prices. Judged by this test the purchasing power of wheat has remained constant save for a slight peak in the war period and then this peak was but slightly above the high peak of the last half of the decade 1890-1900. More significant still the purchasing power of wheat on December first last was the lowest that it has ever been in this forty-year period. The purchasing power of wheat, it will be noticed, runs about the same as does the per capita production of wheat. Neither have increased in the forty-year period. The price received by farmers for wheat has been based on the cost of producing wheat in new and unused lands in the West and not on the cost of producing wheat on older lands where fertilizers have to be used and where labor costs were higher.

In 1899 wheat was produced in 5,737,322 farms in this country. Ten years later, the actual number had increased to 6,361,502, an increase of 10 per cent, as compared with an increase of 21 per cent in the total population of the country in that same period.

In 1909, 35.8 per cent of all the farms in this country were growing wheat, and 12.7 per cent of all improved farm lands was used for growing wheat. Ten years later, but 22.9 per cent of all the farms, and but 9.3 per cent of all improved farm lands were used for wheat production. The average acreage in wheat per farm was 25.6 in 1899; in 1909 it was 30.3.

In the ten year period from 1891 to 1910 the United States produced 20.7 per cent of all the total wheat production of the world. In the ten-year period ending in 1917, this country produced 19.5 per cent of the total world production of wheat, a decline of 1.2 per cent.

Before American farmers can get a price for wheat that will be a fair price the price must be made in this country and not in Liverpool as in the past. A Chicago price made when domestic demand is equal to or greater than domestic production, will be higher at least by three thousand miles of freight, insurance risk and foreign middlemen's profits, to say nothing of the higher prices resulting from other factors in a domestic market.

The ultimate securing of a fair wheat price must depend upon building up city populations throughout the United States so that domestic demand will be equal to domestic supply.

In the meantime everything possible should be done to build up the buying power of the foreign countries which buy our wheat and raise the standards of living of our workers so that they may buy wheat bread.

The outstanding facts about the wheat situation are:

- (1) Our per capita production is not keeping pace with the per capita consumption.
- (2) We must build up domestic markets before we can export to have a price that will be fair to our farmers.
- (3) The actual purchasing power of wheat has not increased in forty years, the increase in production coming from the development of new lands and not from profitable wheat growing on older lands. In the light of such facts as these it is not to be marveled that the farmers are determined to control their marketing processes themselves so as to be sure that they will get what they should for wheat.

The Value of Nitrogen Fertilizer

Availability of the Plant Food As well As Price Should Be Considered in Buying

By Dr. J. G. LIPMAN

Director New Jersey Experiment Station

THE present article deals with nitrogen, in many respects the most important constituent of commercial fertilizers. It is customary to refer to nitrogen in fertilizers as being either inorganic or organic in character. This means that the nitrogen is either mineral in its nature, like nitrate of soda, or sulfate of ammonia, or is derived from animal or vegetable products and is, therefore, called organic. The two chemicals just mentioned, nitrate of soda and sulfate of ammonia, are two of the great staples among the nitrogenous fertilizers. The first of these furnishes about 30 per cent of all the nitrogen used in mixed fertilizers. The second furnishes not very far from 20 per cent of all of the nitrogen used in mixed fertilizers. The two together will, therefore, supply about half of the total nitrogen in mixed goods. Packing house by-products, representing the different grades of tankage, and cottonseed meal are two of the other important sources of nitrogen. The tankages and dried blood contribute in all about one fifth of the total nitrogen used in the manufacture of mixed fertilizers, while cottonseed meal contributes nearly one-sixth of the mixed fertilizer nitrogen. The important point about the entire matter lies in the fact that the nitrogen in these different materials is not equally efficient for the purpose of crop production. To use the term employed by the soil specialists, there is much difference in the "availability" of nitrogen derived from different sources.

Numerous experiments in the United States and Europe, as well as in Japan, India and South Africa, have demonstrated very clearly that it is practically impossible to recover in the crop all of the nitrogen applied in fertilizer or manure. Under average conditions in humid climates about two pounds out of three applied in the form of nitrate of soda may be recovered. In other words, only about 65 per cent of the nitrogen in nitrate of soda, nitrate of lime or nitrate of potash are returned in the crop which is harvested. The rest is not recovered. The situation is even less favorable when the nitrogen is derived from sulfate of ammonia or other ammonia salts, and still less favorable when it is derived from tankage or other animal products. The recognition of this fact has led students of soils and fertilizers to arrange tables of so-called relative availability in which nitrogen obtained from different materials is compared with nitrate of soda in respect to availability. For instance, if the return from 100 lbs. of nitrogen in the form of nitrate of soda is called 100 per cent, then the corresponding return from 100 pounds of nitrogen in ammonia salts would be about 90 or less; the return from tankage would be about 70 or less, and the return from barnyard manure of good quality about 50 or less. Low-grade materials, like low-grade tankage, garbage tankage, leather meal, wool waste, etc., would have even lower values, some of them not above 25 to 30. Naturally, this raises a question in the mind of the farmer as to the actual value to him of the different nitrogenous products. He recognizes, as he thinks of the matter, that there is a difference between so-called commercial values and agricultural values of nitrogenous plant food. By commercial value we would understand, of course, the value of a product as determined by market conditions. Nitrate of soda, selling in carlots at this writing at about \$60.00 per ton, cost \$90.00 or \$95.00 per ton only a year ago. What was responsible for the relatively high price in 1920 and the relatively low price in 1921? Obviously, we are dealing with a question of demand and supply. Fertilizer manufacturers not only compete among themselves for their supply of nitrate, but also with the chemical industry, the explosive industry and other industries where nitrate is used. The same would apply, let us say, to tankage, where the livestock feeder and the fertilizer manufacturer would compete for the material. The market price is determined by the demand and supply

and need not, therefore, have any direct relation to the agricultural value, which depends solely on the actual crop increase which may be obtained from the use of any given quantity of plant food. The commercial value is, therefore, the market value, while the agricultural value is the crop value. It is unfortunate that commercial and agricultural values bear no direct relation to one another in so far as fertilizer nitrogen is concerned. In the case of phosphoric acid and potash the situation is different. There the value of the plant food is more accurately measured by availability or what it may actually do under average conditions in increasing crop production.

The many factors which enter into determining the market price of nitrogen tend to confuse the purchaser of fertilizers and to make it difficult for him to secure the best return on his investment. A simple calculation may help to bring out this fact. Assuming that nitrate of soda can now be bought in carload lots at \$62 per ton, we find that a pound of nitrate nitrogen would cost us 20 cents. If ammonia nitrogen has an availability of 90 per cent, a pound of nitrogen in the ammonia form would be worth 18 cents. Tankage-nitrogen, with a value of 70 per cent, would be worth 14c per pound; manure nitrogen, with an availability of 50 per cent, would

nitrogen is worth 10 cents per pound as compared with the present cost of nitrate nitrogen. The average ton of barnyard manure will contain 10 pounds of nitrogen, which will, therefore, have a value of \$1.00. Good manure will also supply about 10 pounds of potash and 5 pounds of phosphoric acid, worth, at present prices and with due regard to availability, not much more than 50 to 60 cents per ton. This means that as a fertilizer farmyard manure is not worth more than about \$1.50 per ton. However, the manure contains also organic matter and vast numbers of bacteria, which may or may not have a very considerable value, depending on local conditions as to soil, climate and crop. It is scarcely necessary to elaborate on this particular point beyond stating that the disregard of the differences in quality of nitrogen from different sources is costing the farmers of the United States many millions of dollars annually.

The important practical applications of the facts noted above may be summarized as follows:

1. A pound of high-grade nitrogen will go much further than a pound of low-grade nitrogen. Hence, nitrogen in nitrates and ammonia salts will, under average conditions, prove much more efficient and much more economical than nitrogen derived from tankage, fish or cottonseed meal.

2. Where nitrogen is deficient in the soil a small amount of high-grade nitrogen will do the work of a larger amount of low-grade nitrogen. However, the average farmer could well afford to use more nitrogen in his mixed fertilizers than he is now using for the growing of vegetables, potatoes and tobacco, and of fruit and small fruits on the lighter soils.

3. Nitrogen in green clover and other green legumes has a relatively high availability. In fact, nitrogen in green clover is practically as available as nitrogen in tankage. For this reason, nitrogen in commercial fertilizers should at best be regarded as a supplement to nitrogen which the farmer may find it practicable to obtain from the air by means of leguminous green manures.

4. Because of its ready solubility, the agriculturally high-grade nitrogenous fertilizer is easily taken up by the crop and at the same time is more readily subject to leaching out from the soil. Hence, where larger quantities of nitrate or ammonia nitrogen are employed, they should be used with discrimination. In the case of both nitrate of soda and sulfate of ammonia, as well as of other nitrates and ammonia salts, so-called fractional applications may prove most economical. By fractional applications is meant the use of only part of the nitrogen at planting time and the use of a further amount later in the growing season. We often refer to fractional applications as "side dressings."

5. It would pay every farmer to inquire not only as to how much nitrogen the fertilizer which he is to use contains, but also as to the kind of nitrogen contained in the mixture, whether it be nitrate, ammonia or organic, and also as to the relative availability of the nitrogen in the organic portion.

SECRETARY WALLACE TO VISIT NEW JERSEY FARMERS

New Jersey farmers will have an opportunity to make the acquaintance of Secretary of Agriculture Henry C. Wallace and to learn first hand the views of the new Federal administration on big agricultural problems, at the annual field meeting of the State Board of Agriculture, which will be held at the home of its president, United States Senator Joseph S. Frelinghuysen, at Raritan, on Saturday, July 16. Secretary Wallace with United States Senators Capper, of Kansas, and Ladd, of North Dakota, leaders in agricultural advancement in their respective states, will be the guests of the New Jersey Senator for the day and will make addresses.

The Prize Contest

ANNOUNCEMENT was made in the May 28th issue of Pennsylvania Farmer of a prize contest for boys' and girls' club members and vocational school students of the state. The contest is open to all club members and vocational school students who attend the annual Young Farmers' Week at State College, June 20-24. We offer ten cash prizes for the best articles written by these young people describing their activities and results in connection with their club and school work. The first prize of \$10 will be awarded to the writer of the article which is judged to be best according to the scale of points given below. The second prize of \$5 will be awarded to the writer of the second best article. Eight dollars will be awarded as the third prize, and so on, down, the tenth prize being \$1. Pennsylvania Farmer reserves the right to withhold any or all prizes if articles are not submitted which are deemed worthy of reward. The rules and conditions to be observed by contestants are listed below:

- 1—The contest is open to both boys and girls.
- 2—Each contestant must have been a student in a vocational school or have been engaged in boys' or girls' club work in connection with the Farm Bureau programs during the past year.
- 3—Each contestant must have attended at least a part of the activities, for young people at State College during the June Farmers' Week, June 20-24, 1921.
- 4—Contestants may choose their own subjects, but each paper must deal with the activity in connection with club or vocational school work from which the writer believes he derives or has derived the greatest benefit.
- 5—No essay shall exceed 700 words in length.
- 6—Write on one side of the paper only, using typewriter or pen and ink.
- 7—All papers must be in the office of Pennsylvania Farmer, Editorial Department, 261 South Third Street, Philadelphia, by noon, July 15, 1921.
- 8—Papers will be judged upon: (a) Their suggestiveness and educational value, 50 points; (b) Their style and grammatical excellence, 30 points; (c) Their execution, punctuation and general appearance, 20 points.

We anticipate a large number of articles which will be interesting and valuable. Do not disappoint our readers.

Pennsylvania Farmer

Our Daily Bread Supply

Farmers Not the Only Ones Who Should Be Interested in Maintaining Adequate Wheat Prices

THE PEOPLE of the United States are not given to thinking problems thru to the end. We are inclined to consider questions, big and little, with reference only to immediate conditions and necessities and fail to take a long look ahead and see where present tendencies are likely to land us.

The article by Dr. Clyde L. King, a professor of economics in the Wharton School of Finance, appearing on the first page of this issue, should command the serious attention of all classes of people in this country. The question of a nation's bread supply is one that concerns everyone, because it lies at the very foundation of national security. The Great War proved that fact conclusively and the lesson must not be forgotten. While it is earnestly to be hoped that the world will never again see another such calamity, yet the part of wisdom would be to prepare against the possibility by maintaining a sufficient and independent home food supply.

While there is cause for congratulation in the figures supplied by Dr. King in that they show a continued increase in the production of wheat despite the rapid decrease in the proportionate number of farmers yet these same figures show that the surplus production has gradually decreased, and it is only a matter of time until we must import wheat if the present tendency is allowed to continue.

Superficial critics will be inclined to ask, what is the matter with the American farmers? Why is there danger that he may not maintain a safe surplus margin? The answer is, because the average price of wheat fails to return costs and a profit when produced on high-priced land, by high-priced labor, and in competition with other products. The figures show that the purchasing power of a bushel of wheat has not increased in forty years, while the cost of production has greatly increased.

There is another item that must not be overlooked. It is generally known that the world's wheat price-level is fixed by the price in Liverpool. The American farmer gets that price, less the freight from here to Liverpool. If the time comes when this nation must import wheat the price will pay the Liverpool price, PLUS the freight from Liverpool here.

Those who criticize and oppose the activities of farmers in their efforts to establish independent and co-operative marketing systems, and the "Agrarian Bloc" forming in Congress, may find a partial explanation in the menace of a possible future wheat shortage. Farmers clearly see the cause of the present tendency and they also recognize the extent to which America's security would be jeopardized if the time comes when the nation does not supply itself with bread. Even the most radical free-trader will agree that a nation which must depend upon other countries for its fundamental necessities is in a less safe position than one which produces its own, and wheat is the first of these necessities. Wheat can be and is being raised in many other countries more cheaply than here, but it is not good policy to become dependent upon outside sources.

Again, the superficial tho sympathetic person may fall into the error of thinking that a tariff duty on wheat is all that is required to protect the industry of wheat raising. That will probably be true when we reach the point at which our production and consumption are equal. But, in the meantime, while we still have a surplus to export, and while the price in America is governed by the price in Liverpool, tariff duties alone will have little effect on the price in this country. The encouragement of an ample production of wheat at home is a matter for clear thinking and prompt action.

What are we going to do about it?

Farm Loan Bonds

THE DECISION lately handed down by the Supreme Court affirming the constitutionality of the Federal Farm Loan Act has given a new impetus to the work of the Farm Loan Banks. In spite of the criticism made by banking institutions and others to the effect that special banking facilities for farmers are not needed, the pop-

ularity of the Farm Loan Law is shown by the great demand and hundreds of millions of dollars loaned in the short time since its enactment.

The law opens up an opportunity for two classes of farmers—borrowers and lenders. Since the bulk of the money loaned is secured from the sale of bonds based upon first mortgages on farms, an excellent opportunity is offered to farmers who have money to invest to place it on these bonds. They are absolutely safe, and since the investment and the income are both exempt from tax the five per cent which they bear compares favorably with other equally safe investments. If all farmers who have money to invest would place it in these Farm Loan bonds instead of some speculator's wild-cat scheme, as many have done, they would find the result much more profitable to themselves and at the same time they would be contributing to the success of this much-needed agricultural institution.

Pure-Breds in Pennsylvania

THE NECESSITY for a campaign to increase the purebred livestock on the farms of the United States is shown by the figures of the last census. The advance returns for Pennsylvania have just been received and we were surprised at the small number as compared with the total number of farms and the total number of each kind of livestock in the state.

There are something over 202,000 farms in Pennsylvania, but only 22,456, or about 11 per cent, contain any kind of purebred stock. There are 3632 purebred horses, about one-third being males and two-thirds females, found on 1513 farms. It is interesting to note that almost two-thirds of the purebred horses are Percherons. Others in order of numbers are Belgian, Thoroughbred, Standard Bred, Clydesdale, Hackney, Shire and German Coach. All others number 662.

Some purebred beef cattle are found on 1513 farms with a total of 6101 head. More than half of this number are Shorthorns, there being 3676 of this breed. Others are: Polled Durham, 937; Hereford, 686; Aberdeen Angus, 428; Devon, 114; all others, 260.

There is an average of about five purebred dairy cattle on each of 15,194 farms, the total number of purebreds being 75,189, or about one animal to three farms. Almost two-thirds of these are Holstein-Friesian. Others in order of numbers are: Jersey, Guernsey, Ayrshire and Brown Swiss. All other breeds total 2252.

Shropshire sheep are found on the greatest number of farms, 464, but Hampshire Down sheep are more numerous than any other, with Dorset and Merino in third and fourth places.

Only 31 per cent of the farms report having purebred swine. The total number of purebred hogs is given as 34,775, divided as follows: Berkshire, 14,055; Chester White, 7489; Duroc-Jersey, 5292; Poland China, 4669; Hampshire, 1590; Spotted P. C., 118; Yorkshire, 247; all others, 1405.

Our Washington Letter

The dairy cow is the basis of one of the most important manufacturing industries in the country. A preliminary statement of the 1920 census of manufactures shows that there are 3337 butter factories, 3730 cheese factories and 410 condensed milk factories, a total of 7677 factories engaged in the manufacture of dairy products. The value of the annual output of these dairy plants is given as follows: Butter, \$583,216,000; cheese, \$143,708,000; condensed milk, \$339,570,000, a total of \$1,065,794,000.

The industries that are larger than dairy manufactures are automobiles, boots and shoes, bread and bakery products, railroad cars, men's and women's clothing, cotton goods, flour and grist mill products, iron and steel products, lumber and lumber products, packing house products and shipbuilding.

When the hearings on the Smoot general sales tax were begun there was apparently a strong sentiment in the committee for the proposition. As the hearings advanced, arguments in opposition to the tax, made by many able economists and tax experts, were so conclusive that there is little probability of the sales tax bill getting thru either the Senate or the House. The excess profits tax may be repealed, but there is an increasing sentiment against repeal.

In discussing the road question Gray Silver, Washington representative of the American Farm Bureau Federation, said: "The roadways of the country should be considered as a whole and a comprehensive plan should be provided, which, in a reasonable term of years should give our people good roads everywhere."

June 11, 1921

June 11, 1921

Pennsylvania Farmer

A number of leading wool growers, including representatives of the National Sheep and Wool Bureau of America, and several state wool growers' associations, are in Washington this week, attending hearings on the truth in fabric bill. It was the contention of Gray Silver, Washington representative of the American Farm Bureau Federation, that two-thirds of the woolen clothes manufactured are shoddy. We do not allow the manufacturer of rebuilt auto tires to sell them as new; we do not permit oleomargarine to masquerade as butter; we have pure food and pure drugs laws, and the farmer along with the consumer and merchant wishes to see a truth in fabric law which will protect them.

Owing to the attitude of the Secretary of the Treasury in opposing this revolving fund proposition, the Congressmen representing the agricultural districts have decided to favor a proposition to have a fund of \$50,000,000 created in the Treasury which will be virtually a call loan. The secretary can loan this money to the Farm Loan Board, and it will be practically the same as a revolving fund. The Congressmen are going to push this proposition, the bill to increase the interest rate on farm loan bonds to 5 1/2 per cent, and the Strong bill to raise the limit of farm loans from \$10,000 to \$25,000.—E. E. Reynolds.

HARRISBURG LETTER

No Expansion of Work.—Reduction of appropriations for the State Department of Agriculture will prevent expected expansion of the work of the Department's Bureau of Markets; restrict some research work planned by the Bureau of Animal and Plant Industry and compel doubling up of men in various lines of activity of the department, while it is possible the program for surveys may be curtailed. Along with almost every branch of the state government the agricultural department suffered loss of appropriations and some plans for the coming two years will not be carried out. About the best that can be done is to conduct business much as it has been with exception of the farmers' institutes, which have been eliminated. The state authorities will look to State College to supply talent for the educational work, which has been conducted direct from the offices of the department since 1894.

To Name Commissions Soon.—Contrary to opinions Governor William C. Sproul will probably name members of various commissions early and ask them to meet before the end of summer and outline their work. The Welfare Department Board and State Council of Education will be among those named promptly as certain work will have to be undertaken by them. The State Fair Commission, which is to talk over a fair site and plans for the future, is to be named during the summer.

The Constitution Question.—Present indications are there will be two or three separate ballots for the primary election and that the question of holding a constitutional convention will be voted upon on a slip of paper all its own. Of course, this may be changed when the time comes for making up the ballot. Interest in the question of holding a convention is growing and bids fair to be a very fruitful subject of discussion during the summer months. Incidentally, there are some people getting ready to make a drive for the adoption of a system for control of charities receiving a share of state money so that they furnish so much free service per \$1000 or are reduced in number.

Grain Doing Well.—June 1 reports to the Department of Agriculture indicate wheat and rye are doing well generally and unless the fly or rust get in their work there should be a big crop. While some districts in the "million bushel counties" cut down their acreage the fine appearance of the grain promises to make up for the loss. The acreage being put into corn is also said to be good. In some sections reports on fruit are better and there will be a fair sized pear crop.

New Stallion Law.—The State Bureau of Animal Industry is getting ready to put into effect the new law which will encourage breeding of better horses and Dr. T. E. Munce, the director, has taken steps to bring it to attention of all field men. The

registration of stallions and jacks has shown an increase lately. Dr. Munce is perfecting plans for some surveys in sections where poultry is extensively raised to ascertain the situation in regard to tuberculosis in chicks.

Cover Insurance Crops.—According to statements by officials of the State Department of Insurance there is now no bar to insurance of crops in Pennsylvania against loss by frosts, blight, insects, pests or anything which can damage a crop, provided a company will insure. The new code covers everything that is insurable, even to insuring against loss of freight while being transported by airship.

NEW YORK LETTER

Great Meeting of Cattle Breeders.—The biggest meeting and sale of the National Holstein Breeders' Association has ever held is in full swing. Former Governor Frank Lowden of Illinois has been elected as president for the coming year, and George E. Stephenson of Scranton, Pa., vice president. Dissatisfaction with the administration of the past year caused a decided storm in the convention and the first of the three days' sale was postponed in order to settle several problems that came up for discussion. Michigan cattle took the \$500 prize offered by the New York State Fair Commission for the best state exhibit. New York breeders did not compete for this, though they had twice as many animals as any other state. Pennsylvania ranked second, Canada was third and Washington, fourth. Kansas City will entertain the next annual meeting.

Milk Disturbances.—Now and then some farmers are withdrawing from various League plants, not understanding the need of patience while the immense new pooling plan is being worked out. Shifts are being constantly made as new plans are acquired by the League, or as temporary plans are adopted. A dealer's milk war is on in Auburn with milk being sold as low as 7 cents. Butter prices went as low as 28 cents this week and cheese to 15 cents. On this basis Class 4 milk will bring but 90 cents for 100 lbs. This might have ruled the entire milk price disastrously. As it is Class 1 milk is bringing \$1.95 per 100 lbs. under the pooling plan. The League is forced to ease for surplus milk until this disappears about July 1. A fairer basis for handling non-pooling members is being sought and after October 1 the sale of non-pooled milk may be discontinued.

School Survey Ended.—The work of the rural school committee of 21 is nearing completion as the survey made by experts is near its close. Several weeks will be required to compile the facts collected so the education department may be considered. The situation, Divisional meetings have been held and others may be by the committee.

Drought Conditions.—After about 3 weeks of drought more forest fires broke out in the Adirondacks last week than in many years. Crops were badly in need of water when heavy showers came the first of the week, accompanied by electricity which burned many barns and killed numbers of animals.

NEW JERSEY NEWS

No Increased Pay.—The State of New Jersey will not allow any increased pay to its employees for the fiscal year beginning on July 1 next. This has been announced to the New Jersey Civil Service Commission by State Comptroller Newton A. K. Bugbee, and the commission has accordingly sent a notification of the intention of the Commonwealth to all of the attaches. New civil service regulations stipulate, that no change shall be made in either the classification or positions or schedule of salaries during the coming year, while they eliminate extra compensation and bonuses, provide that all new employees shall receive minimum and not maximum salaries, and establish a definite policy regarding vacations and leaves of absence of attaches of the state with or without pay.

Commissioner Retiring.—Dr. Calvin N. Kendall, who has been the State Commissioner of Education for New Jersey for ten years, retires on June 30th, owing to ill health.

A pipe won't burn your tongue if you smoke P. A.!

Get that pipe-party-bee buzzing in your smokesession! Know for a fact what a joyous jimmy pipe and some P. A. can and will do for your peace and content!

And, you can wager your week's wage that Prince Albert's quality and flavor and coolness—and its freedom from bite and parch (cut out by our exclusive patented process)—will ring up records in your little old smokemeter the likes of which you never before could believe possible!

You don't get tired of a pipe when it's packed with Prince Albert! Paste that in your hat! Each fire up makes you happier! My, my, how P. A. and a jimmy pipe do ring the bell!

Prince Albert is sold in tippy red bags, tidy red tins, handy some pound and half pound tins, humidor and in the pound crystal glass humidor with sponge moistener top.

HORTICULTURE

The Problem of Plant Lice

Garden plants of nearly all kinds, and especially cucumbers, melons, and cabbages, tomatoes, radishes and peas, frequently suffer severe injury from the attacks of small, soft-bodied greenish insects known as plant lice or aphids. This group of insects which feed by sucking the juices of the plants, works on the under side of the leaves. As the sap is extracted the leaves become curled and dry up, frequently causing the death of the entire plant.

With favorable conditions, plant lice increase with great rapidity. If they appeared only in small numbers they would not be serious, but when millions of them are at work covering the entire lower surfaces of the leaves, the plants are soon killed. In the early spring the plant lice suck the juices of various weeds and other plants, but with the growth of melons, cucumbers, cabbage and other garden plants, the winged forms make their way to these plants, suck the under surfaces of the leaves, and here they begin to suck the sap and bear living young.

FREED OF THE GIPSY MOTH

The gypsy moth, which a year ago threatened to become a serious menace in Pennsylvania, is now believed to be under control. Experts of the Pennsylvania Department of Agriculture, who have been engaged in fighting the pest, have completed an inspection which has indicated a very satisfactory condition.

Some months ago the gypsy moth was found on an estate in Cambria County. Traces of the moth were also found in the southeastern part of the state. Experts from the Bureau of Plant Industry of the Pennsylvania Department of Agriculture examined practically every shrub, vine and tree within a two-mile radius of the center of infection in Cambria County, and not a trace of the moth could be found. The same condition was found in the southern part of the state.

The corrective measures applied last fall are believed to have freed the state of this pest, but the inspections will be continued from time to time during the summer.

A York County Farmer and Farmerette—Isabelle and Eugene Beshore

JERSEY UNION GROWERS TO CO-OPERATE

Stimulated to action by the disastrous break in the onion market last summer, which resulted in a severe loss to the growers, the farmers of Cumberland County who grow large quantities of onions met at Cedarville on May 17 and organized an association for selling their crop co-operatively.

The association will have a board of 15 directors. An organization committee was appointed with Howard Steward of Cedarville chairman, to perfect the organization and enroll members.

It is expected that about 150 growers will join in this co-operative enterprise, and market the yield of 1200 acres thru the association.

SHORTAGE OF FRUITS, PREDICTED

The state agents of the Bureau of Crop Estimates, U. S. Dept. of Agriculture, report that there will be a short fruit crop this year. The shortage will be fairly general east of the Rocky Mountains, except in portions of Michigan, New York and New England. The reports refer particularly to stone fruits, such as cherries, plums and peaches, but also indicate that there will be a material shortage of apples and grapes, though not as extensive as the shortage of stone fruits. It is too early, say the statisticians, to make an estimate of the probable yield of blackberries and raspberries. With the shortage of stone fruits it is expected that the fruit supply for domestic canning will be limited.

SPRYWHEEL

The \$150 Tractor

F. O. B. Boston, Mass., Crating Extra

Multiplies Man Power by Five from Seedtime to Harvest

One Gallon
One Day's Fuel

Don't Overlook Sprywheel

It practically eliminates the biggest item of cost in truck farming—hand hoeing

YOU can't tell what prices your crops will bring. But you can figure the cost of those same crops in fertilizer, seed, capital and labor invested. And labor—hand labor—is the great big item that is so often partly overlooked in fixing costs. Almost the only way to lower your crop cost is to reduce the labor cost or in some way increase the yield per plant and per acre.

Sprywheel makes both of these things possible.

How Sprywheel increases the yield per acre

Sprywheel makes both practical and economical the continuous and late-season cultivation which agricultural colleges and farm experiment stations have definitely proved yields crop increases far in excess of the cost of the additional labor—even when hand hoes and wheel hoes are used. Using Sprywheel this cost is reduced to a fifth of the cost of doing the work by hand.

Sprywheel also permits planting rows so close together that plants have just enough room to attain full maturity—an important advantage on high-priced, heavily fertilized land.

Besides, Sprywheel insures uniform and timely cultivation—turns and mixes the soil more evenly and thoroughly than is possible by hand or wheel hoes, keeps the top soil loose, conserves moisture and keeps down weeds. Cultivates rows right up to maturity, long after the height and spread of the plants makes multiple row cultivation impractical.

For these reasons Sprywheel cultivation means extra bushels per acre—added profits.

How Sprywheel cuts crop costs and increases profits per bushel

Sprywheel substitutes machine power for muscle power. It enables one man to do more and better cultivation than five men with hand or wheel hoes.

In five minutes a power lawn mower

By loosening two bolts, the cultivator tool assembly is dropped. Substitute the Sprywheel Lawn Mower Attachment. Fasten in place with the same two bolts, and you have a power lawn mower—remarkably sturdy, simple, efficient, and easily guided. Especially suited to country estates, country clubs, parks and cemeteries.

Sprywheel's improved fuel economizer

One of the many engineering improvements which Sprywheel embodies is the Sprywheel Slow Speed Plug. It applies a new principle of carburetion—gives greater power at slower speed with a real saving in gasoline consumption. With the slow speed plug you get maximum horse power at 1 1/2 to 2 1/2 miles per hour. Remove the plug and you get the same horse power at 2 1/2 to 4 miles an hour—two speeds and no gears. It's a great invention.

Leading implement dealers demonstrate and sell Sprywheel

Authorized Sprywheel dealers are experienced and responsible. Write us for full and detailed description of what Sprywheel is and what it will do. If you so desire, we will arrange to have the nearest Sprywheel dealer demonstrate Sprywheel for you. All Sprywheel dealers maintain a stock of parts, tools and attachments—are equipped to render prompt service to every Sprywheel owner in their territories. Write today for a Sprywheel catalog and the name of the nearest Sprywheel dealer.

There is still a little open territory. It will stay open till we find live dealers. If you are the man we should tie up with, write or wire.

A labor saver for market gardeners, nurserymen and home gardeners

Sprywheel has power and traction enough to pull sets of weeding rakes, cultivating teeth, hoes, right and left hilling shovels or a small plow for running seeding furrows. It practically eliminates hand-hoeing.

Hundreds of half-acre home gardeners, horticulturists, nurserymen and market gardeners have found Sprywheel the greatest labor-saving and money-making investment they ever made. You should own one or more. Uses the same tools as your wheel hoe.

Miss Cynthia's Novelty Dish

"WHY, yes, Mrs. Berkley, I'll do my bit. When do you say it is? Thursday? Very well. Yes, good-bye."

Miss Cynthia, as she hung up the receiver, felt suddenly and strangely limp. You see, she had always prided herself on her culinary products, but this fairly took her breath and she racked her brain—and pantry as well—for something particularly choice, attractive and toothsome also. For, by a strange coincidence, two golden weddings were to be celebrated, only three days off, by all the village and farm folks, and the committee suddenly decided that they needed some more food, and wanted something novel. Very early she arose on Wednesday morning and baked and roasted, but

which she washed carefully. Dearly she slipped a leaf under each tissue-encased ball, as illustrated, which gave each platterful exactly the right color finish.

Packing the precious platters of cheese balls each in a separate paste-board suit box (she always saved these boxes), she tied them stoutly atop of each other so that she could carry the platterfuls with no danger of mishap. She got in with John's folks when they came along and stopped for her.

At the town hall the long tables were already rapidly being filled with choicest viands when Cynthia and John's folks arrived. After impressive, fitting services and greetings from the "bridal parties" who stood with their attendants in recep-

A Pleasing Way to Serve Cottage Cheese

when they were all prepared, somehow they looked "common," and she wanted something different from others.

At noon, still troubled, she started out with the sour milk for the poultry. Half way back to the house an idea came to her that made her all animation and ambition. She had thought of the dish that might distinguish itself. She fairly flew to the cellar, gathered up the pans that contained the freshest "clabber" and hastened to place it all on the back of the range, where it stayed until of proper consistency, and she could remove the soft, shining curd from the liquid.

Tying this in a clean linen bag, she hung it up to drain thoroly. Then she got the platters all ready, and cut small squares of waxed paper. Then she cracked some hickory-nuts, being careful to keep the kernels whole. When the curd was ready she emptied it into a bowl of sufficient size, salted it to suit taste and added quite a lot of rich sweet cream, mixing it in thoroly. Then she shaped the cheese into good-sized round balls, and carefully placed each one in a square of waxed paper, as illustrated herewith. When all were so prepared, she gave each just a dash of black pepper and pressed in a choice nut meat on top. Carefully she put them away in a cool place till morning.

Next morning she was up early again and out in the garden clipping choicest, tender celery leaves,

which she washed carefully. Dearly she slipped a leaf under each tissue-encased ball, as illustrated, which gave each platterful exactly the right color finish.

How to Pack

The asparagus is packed at once into clean hot jars, the jars are filled with boiling water, a teaspoon of salt is added to each pint, and the rubbers and covers are adjusted and partially sealed.

Because asparagus is more liable to spoil than many other vegetables, the use of the pressure canner is recommended. Cooking for 40 minutes under 10 lbs. of steam pressure has been found the most satisfactory method.

The "acid method" has been suggested if a pressure canner is not available. It consists of using 1 tablespoon of vinegar or lemon juice per each pint of asparagus and boiling for 1½ hours in water.

With either method, the jars should be removed promptly from the canner or bath and sealed.

Save Stalks For Soup

The tough ends of the stalks should be canned for soup. The pieces should be cooked in as little water as possible until they are soft enough to press thru a sieve. The pulp is then put into clean hot jars and 1 teaspoon of salt is added to each pint. Grated onion or celery may be added if desired. After the rubbers and covers have been adjusted and partially sealed, the jars should be processed for 40 minutes under 10 lbs. steam pressure, or 1 tablespoon of vinegar may be added to the jars per each pint, and then cans boiled in a hot-water bath for 3 hours.

The jars should be removed from the canner or bath at the proper time and sealed at once.

This puree may be used as the foundation for cream of asparagus soup or added to any kind of meat stock.—N. Y. Agricultural College.

FRUIT CAKE WITHOUT SPICE

In housecleaning and gardening time, we women like to bake up food that can be kept in good condition several days to be ready for use on short notice. Fruit cake is an old standby for this purpose. To make variety make up some of the following recipe. A good many do not care for such heavily spiced cakes as fruit cakes usually are, and they will be glad of this way to make a good

fruit cake without spicing it. The fruit used is dried apricots. Look over and wash some apricots, and put them thru the food chopper. Use enough so that you will have 1 cupful of the pulp after they are thus chopped.

Beat 1 egg in a mixing dish, add 1 cup sugar and ½ cup shortening (butter or lard or vegetable oil fat), and beat until creamy. Sift together 2 cups flour, 3 level teaspoons bak-

ing powder, and ¼ teaspoon salt. Gradually stir into the sugared shortening this flour and ½ cup milk. When well mixed, add the chopped apricots, and bake as a loaf cake. This cake keeps well, and the apricots give it a nice flavor.—Viola M. Lee, Broome Co., N. Y.

HOME-MADE HOOKED RUGS

Hooked rug making is fascinating home work. You can use old worn woolen goods that still retain their color, such as red blankets, dress goods and men's suits, if not too thick. And to get other colors you can easily dye them with the handy dyes now on the market.

The rugs must be cut much finer than carpet rugs, and cut according to the thickness of the goods. For the foundation of the rug I find common burlap such as is wrapped around furniture better than fertilizer sacks because it is not so tightly woven. Cut the burlap the size you wish the rug to be, hem it neatly with cord or coarse thread, making a flat hem ½-inch deep. Sew the burlap into a frame as you would for quilting a quilt. You could use quilting frames, but small frames are easily made and are more convenient.

Now you are ready to start on your design. Make the design according to the rugs you have. If you have bright colors, roses and leaves are possible and pretty. The illustration shows one of my prettiest rugs. The center background is made of an old red woolen blanket. The roses are outlined with raveled burlap by putting five or six strands together and drawing it thru the burlap the same as the rags. Burlap strands are fine for outlining; they wear well and look fine. The roses are made of a different shade of red from the red in the center. The leaves, which do not show up in the photo, are outlined with black and made of two shades of green, one-half of each leaf of each shade.

The scallop border is outlined with one row of black, followed with one row of raveled burlap. The outer edge of the scalloped center is bordered the same way.

The space between the border and center is made of light gray. Bow knots of the center color fill the corners prettily.

Mrs. Moore's Hooked Rug

The center background and the edge are dark red, the roses are a different shade of red, and the light part is gray.

fruit cake without spicing it.

The fruit used is dried apricots. Look over and wash some apricots, and put them thru the food chopper. Use enough so that you will have 1 cupful of the pulp after they are thus chopped.

Beat 1 egg in a mixing dish, add 1 cup sugar and ½ cup shortening (butter or lard or vegetable oil fat), and beat until creamy. Sift together 2 cups flour, 3 level teaspoons bak-

For the weaving use a heavy steel crochet or rug hook. Do not sew the rags. To those who have never made a rug of this kind I suggest that they hem a piece of burlap 1½ yards long and ¾ yard wide, and mark a border 5 inches wide all around, then make the center hit and miss, and the border of one kind of goods.

Hold a strand in your left hand on the under side of the burlap, and

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct filling of orders. Give bust measure when ordering for waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3590.—Set of Pretty Caps.—The pattern is cut in 3 sizes: 18, 20 and 22 inches. To make the caps for either head size indicated will require ½ yard for No. 1 and for No. 2, ¾ yard for the lining and ¼ yard for the outer portions. Embroidered silk, linen or lawn would be pretty for No. 1; No. 2 could be of silk, voile, batiste, lawn, net or crepe de chine. Pattern, 10 cents.

3613.—Frock for Play or School.—The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. A 6-year size requires 1½ yard of 36-inch material. Cotton, poplin, gingham, kindergarten cloth, percale, lawn and crash are attractive for this model. Stitching, embroidery or braid forms a suitable decoration. Pattern, 10 cents.

3562.—Popular Style for Growing Girl.—It is cut in 3 sizes: 12, 14 and 16 years. A 14-year size will require 3½ yards of 44-inch material. Crepe de chine with frills of taffeta or organdy would be attractive for this model or, pongee, voile, linen, batiste, also gingham, challie and satin. Pattern, 10 cents.

PATTERN CATALOG NOTICE

Send 15c for our up-to-date Spring and Summer 1921 Catalog, containing over 500 designs of ladies', misses and children's patterns, a concise and comprehensive article on Dressmaking, also some hints for the needle (illustrating 20 of the various, simple stitches), all valuable to the home dressmaker.

Fruits, fresh air and exercise are better than pills and potions.

If the back yard is kept neat, it is usually the women folks who must do it. A row or two of flowers, a shrub or so, will help make the neatness seem more worth-while.

We Would Like to Send You This Book About Better Heating

THIS new book will surely interest you, if you are planning the erection of a new home—or if you have a residence, store or other building that is improperly heated. "THE STORY OF HOMAKER" sets forth in plain, simple language the advantages of the pipeless furnace method of heating. It also explains exactly why HOMAKER is the better pipeless furnace.

HOMAKER is the product of ripe experience, backed by the most modern of manufacturing resources. It is built by The Williamson Heater Company, which, for nearly a third of a century, has ranked among the foremost heating and ventilating engineers of this country.

HOMAKER PIPELESS FURNACE

This better pipeless furnace is pre-eminently the heating plant for economy, comfort and health. HOMAKER furnishes an abundance of warm, balmy air that is absolutely clean—dust-free. It ends the dust and dirt evil for all time. When you shake or dump HOMAKER, all its doors are closed tight. No dust can escape.

HOMAKER is the oversize furnace. Its generous dimensions of casing and register, the centering of all heat-radiating castings and the elimination of all abrupt angles, are wonderful fuel savers. Combined, they assure free, easy circulation of the heated air—plenty of warmth on the coldest days without forcing the fire.

HOMAKER has a quadruple casing, the inner section being of laminated construction (2 sheets of steel between which is placed a heavy layer of air-cell asbestos). This improved insulation conserves practically all the heat. Instead of heating the cellar, the warm air travels directly up through the register and into every room in the home.

Ample Warmth Guaranteed

The Williamson Heater Company guarantees that HOMAKER will heat your home to your entire satisfaction. If it fails, your money will be refunded, your furnace taken out and every trace of its installation removed. Find out why you have the right to expect more—in comfort, health and economy—from this better pipeless furnace. Write today for our free book "The Story of HOMAKER."

This department is reserved for use of our readers to discuss problems and matters of general farm interest. Write your views and comments briefly on any question of social, economic or educational importance and thus share them with others. Such articles should not exceed 200 or 300 words. Publication of such articles does not signify editorial endorsement or agreement.

THE COST OF ANTHRACITE COAL

We noticed an article in your May 21st issue of this year headed: "Fleeing the Public," which article deals with the sale price of anthracite coal and which we believe was written without getting first hand information on the subject.

The public do not seem to be generally aware of the fact that the anthracite miners had a vacation strike last year which was in effect the breaking of their agreement with the operators, and the Government intervened and after extensive hearings covering both sides the miners were granted a material increase in wages. This contract does not expire until next spring and the anthracite operators cannot break the contract at this time without laying themselves open to a charge of bad faith and we do not believe they are disposed to do anything except to keep their contracts, when honestly and fairly entered into. In as much as the wages are a very large proportion of the cost of mining and there is no prospect of a reduction, and in view of the fact that there has been no reduction in royalties, taxes, etc., except for possibly a few items of material that would enter into general repair about the breaker, this would indicate that a reduction in the price of anthracite coal at the present time would not be warranted and the present prices coincide very closely with the prices fixed by the Government allowing for increases due to increased pay, etc., that have intervened since Government control was removed.

There was a period of exceedingly light buying resulting in a partial suspension of mining during the latter part of February and March, and the months of April and May saw a comparatively light demand compared with the demand usually experienced in these months. This has had the effect of creating a shortage of coal above ground and in as much as anthracite coal has reached its peak in production and is gradually drifting into the luxury class it is exceedingly important that those who depend on it for their supply of fuel should arrange to make their purchases so that production will be continuous thruout the year and thus keep costs at a minimum and enable all parties to be satisfied as would be possible.

We are convinced that the policy of less government in business would be the policy to apply to the anthracite industry, and if anthracite prices are left to seek their own level in a normal competitive way we believe the public will be economically and satisfactorily served. We do not believe the same economy and satisfaction could be had from government ownership or control.

There is plenty of fuel available such as anthracite, briquettes, bituminous coal, canal-coal and coke, all of which fuels can be purchased at less money than the domestic sizes of anthracite coal and the supply of these other fuels in the aggregate seems almost unlimited so far as our present needs are concerned and it is generally conceded that each year a certain proportion of the public could effect satisfactory economies by using the cheaper fuels, recog-

nizing that anthracite coal is more expensive and partakes of the character of a luxury.

We trust that we have not burdened you with this detail but in as much as there is something to be said in defence of the anthracite situation we believe it should be said when charges such as appeared in your paper are being broadcasted and if nothing is said in defence it would appear as tho there was nothing that could be said, and such is not the case.

We have been shippers of anthracite coal, as well as other fuels, for over thirty years, and endeavor to keep in close touch with conditions pertaining to the fuel market, so that we are able to give our customers intelligent advice with regard to the quality of various fuels and make recommendations as to the best seasons of the year to buy both for economy in price and assurance of having adequate stocks of coal on hand when they are needed.

Our present advice to retail dealers, consumers and manufacturers, particularly as applied to anthracite coal, would be to put in their season's supply as promptly as possible if they have not already done so, as this policy will result in a saving in money and avoid much incurring delay due to inability of the mines to produce and ship coal fast enough to cover the needs of the public when the burning season has arrived.

We expect that car shortage will also be in evidence during the fall and winter which will add to the difficulties of the situation.—W. H. Druckemiller, Northumb'nd Co., Pa.

ANNUAL WHITE SWEET CLOVER

It has been determined that sweet clover, which grows luxuriantly along roadsides and out-of-the-way places, and which is grown in some sections as a forage crop, has one strain which is annual. The annual sweet clover occasionally appears in patches of the more common biennial form, either as single specimens or in small groups. Seed of the annual has been separated and in recent years it has been propagated.

The nature of this new variety is such as to indicate that it may have important possibilities. Probably its greatest use for hay will be as an emergency crop. When a stand of clover has been winter killed, or for any reason a farmer finds that his hay supply will be short, this variety can be seeded during the spring and, provided lime and the proper bacteria are present, yield a good hay crop. Where rainfall is sufficient it may be seeded even after wheat harvest. It makes a good growth the first season, and experiments in Iowa and Michigan have shown that it may be seeded with oats to be harvested after the grain is cut. It grows rapidly, and for this reason will keep ahead of weeds.

The annual has a smaller and more woody root than the biennial form, and crown or resting buds are not formed. The stems, branches, leaves, flowers, pods, and seeds are indistinguishable from those of the biennial form, but during the season of seeding the plant grows more rapidly, blossoms, fruits, and dies. It blooms early and ripens seed in August when seeded early.

Merry Garden AUTO-CULTIVATOR

Merry Garden Auto-Cultivator will double the return from your truck farm or nursery. It solves the labor problem. A boy can do as much work as four men with hand cultivators. With a Merry Garden you can cultivate, disc, harrow and weed in any soil. It straddles narrow rows, works between the winter ones and gets close to roots if desired. Easy to guide, back and turn around and back to handle. All mechanism is of latest approved design—2 h. P. Efficient water-cooled motor, completely enclosed gears. Beach Magneto, trouble proof lubrication. Atlas Air Cleaner. Try it for 5 Days. Guaranteed to do all we claim or money back. Price \$250 f. o. b. Cleveland, Ohio. Write for free descriptive literature.

The Valley of the Giants

By PETER B. KYNE

Synopsis—John Cardigan, a middle-aged man—a giant in frame and mind—was a settler along the Pacific coast in Humboldt County, California, in 1850. His business was cutting the plant trees into lumber. His young wife died and was buried among the redwoods in "The Valley of the Giants," as he called the spot which he loved and preserved as a shrine to her memory. Bryce, Cardigan's only son, was an intimate chum of his father—who planned that he should inherit the great lumber business which he had built up. Bryce had a brief love affair with Shirley Sumner, a visitor to the neighborhood, but she was soon forgotten. Cardigan tried to buy a tract of timber adjoining his and refused to be lured into raising his offer for it. He determined to move his mill to the San Hedrin watershed and start logging operations there. Bryce, after four years of service in the East, and two years of travel, abroad returned to Sequoia. He was met at the train by George Sea Otter. Bryce declared an interest in a young woman who sat off the train with him and found no one to meet her. He learned that she was Shirley Sumner and she accepted his invitation to ride to Sequoia with him.

Chapter VI

THEY were on the road again by eight o'clock next morning, and just as Cardigan's mill was blowing the six o'clock whistle, Bryce stopped the car at the head of the street leading down to the water-front. "I'll let you drive now, George," he informed the silent Sea Otter. He turned to Shirley Sumner. "I'm going to leave you now," he said. "Thank you for riding over from Red Bluff with me. My father never leaves the office until the whistle blows, and so I'm going to hurry down to that little building you see at the end of the street and surprise him."

He stepped out on the running-board, stood there a moment, and extended his hand. Shirley had commenced a due and formal expression of her gratitude for having been delivered safely in Sequoia, when George Sea Otter spoke:

"Here comes John Cardigan," he said.

"Drive Miss Sumner around to Colonel Pennington's house," Bryce ordered, and even while he held Shirley's hand, he turned to catch the first glimpse of his father. Shirley followed his glance and saw a tall, powerfully built old man coming down the street with his hands thrust a little in front of him, as if for protection from some invisible assailant.

"Oh, my poor old father!" she heard Bryce Cardigan murmur. "My dear old pal! And I've let him grope in the dark for two years!"

He released her hand and leaped from the car. "Dad!" he called. "It is I—Bryce. I've come home to you at last."

The slightly bent figure of John Cardigan straightened with a jerk; he held out his arms, trembling with eagerness, and as the car continued on the Pennington house Shirley looked back and saw Bryce folded in his father's embrace. She did not, however, hear the heart-cry with which the beaten old man welcomed his boy.

"Sonny, sonny—Oh, I'm so glad you're back. I've missed you, Bryce, I'm whipped—I've lost your heritage. Oh, son! I'm old—I can't fight any more. I'm blind—I can't see my enemies. I've lost your redwood trees—even your mother's Valley of the Giants."

And he commenced to weep for the third time in fifty years. And when the aged and helpless weep, nothing is more terrible. Bryce Cardigan said no word, but held his father close to his great heart and laid his cheek gently against the old man's, tenderly as a woman might. And presently, from that silent communion of spirit, each drew strength and comfort. As the shadows fell in

John Cardigan's town, they went home to the house on the hill.

Chapter VII

Shirley Sumner's eyes were still moist when George Sea Otter, in obedience to the instructions of his youthful master, set her, the French maid, and their hand-baggage down on the sidewalk in front of Colonel Seth Pennington's house. The half-breed hesitated a moment, undecided whether he would carry the hand-baggage up to the door or leave that task for a Pennington retainer; then he noted the tear-stains on the cheeks of his fair passenger. Instantly he took up the hand-baggage, kicked open the iron gate, and preceded Shirley up the cement walk to the door.

"Just wait a moment, if you please, George," Shirley said as he set the baggage down and started back for the car. He turned and beheld her extracting a five-dollar bill from her purse. "For you, George," she continued. "Thank you so much."

In all his life George Sea Otter

Waiting For Her Mail

had never had such an experience—he, happily, having been raised in a country where, with the exception of waiters, only a pronounced vagrant expects or accepts a gratuity from a woman. He took the bill and fingered it curiously; then his white blood asserted itself and he handed the bill back to Shirley.

"Thank you," he said respectfully. "If you are a man—all right. But from a lady—no. I am like my boss. I work for you for nothing."

Shirley did not understand his refusal, but her instinctive tact warned her not to insist. She returned the bill to her purse, thanked him again, and turned quickly to hide the slight flush of annoyance. George Sea Otter noted it.

"Lady," he said with great dignity, "at first I did not want to walk on this land." And with a sweeping gesture he indicated the Pennington grounds. "Then you cry a little because my boss is feeling bad about his old man. So I like you better. The old man—well, he has been like father to me and my mother—and we are Indians. My brothers, too—they work for him. So if you like my boss and his old man, George Sea Otter would go to

Manayunk for you pretty darn quick. You bet you my life!"

"You're a very good boy, George," she replied, with difficulty repressing a smile at his blunt but earnest avowal. "I am glad the Cardigans have such an honest, loyal servant."

George Sea Otter's dark face lighted with a quick smile. "Now you pay me," he replied and returned to the car.

The door opened, and a Swedish maid stood in the entrance regarding her stolidly. "I'm Miss Sumner," Shirley informed her. "This is my maid Marcelle. Help her in with the hand-baggage." She stepped into the hall and called: "Ooh-hoo! Nunky-dunk!"

"Ship ahoy!" An answering call came to her from the dining room, across the entrance-hall, and an instant later Colonel Seth Pennington stood in the doorway. "Bless my whiskers! Is that you, my dear?" he cried, and advanced to greet her. "Why, how did you get here, Shirley? I thought you'd missed the stage."

She presented her cheek for his kiss. "So I did, Uncle, but a nice red-haired young man named Bryce Cardigan found me in distress at Red Bluff, picked me up in his car, and brought me here." She sniffed adorably. "I'm so hungry," she declared, "and here I am, just in time for dinner. Is my name in the pot?"

Chapter VIII

Along the well-remembered streets of Sequoia Bryce Cardigan and his father walked arm in arm, their progress continuously interrupted by well-meaning but impulsive Sequoians who insisted upon halting the pair to shake hands with Bryce and bid him welcome home. In the presence of those third parties the old man quickly conquered the agitation he had felt at this long-deferred meeting with his son, and when presently they left the business section of the town and turned into a less-frequented street, his emotion assumed the character of a quiet joy, evidenced in a more erect bearing and a firmer tread, as if he strove, despite his seventy-six years, not to appear incongruous as he walked beside his splendid son.

"I wish I could see you more clearly," he said presently. His voice as well as his words expressed profound regret, but there was no hint of despair or heartbreak now.

Bryce, who up to this moment had refrained from discussing his father's misfortunes, drew the old man a little closer to his side.

"What's wrong with your eyes, pal?" he queried. He did not often address his parent, after the fashion of most sons, as "Father," "Dad" or "Pop." They were closer to each other than that, and a rare sense of perfect comradeship found expression on Bryce's part, in such salutation as "pal," "partner" and, infrequently "old sport." When arguing with his father, protesting with him or affectionately scolding him, Bryce, with mock seriousness, sometimes called the old man John Cardigan.

"Cataracts, son," his father answered. "Merely the penalty of old age."

"But can't something be done about it?" demanded Bryce. "Can't they be cured somehow or other?"

"Certainly they can. But I shall have to wait until they are completely blind; then a specialist will perform an operation on my eyes, and in all probability my sight will be restored for a few years. However, I haven't given the matter a great deal of consideration. At my age one doesn't find very much difficulty in making the best of everything. And I am about ready to quit now. I'd like to, in fact; I'm tired."

"Oh, but you can't quit until you've seen your redwoods again,"

John Cardigan shook with an inward chuckle, for the loving abuse of his boy had formed a habit of heap- ing on him never failed to thrill him. Instinctively Bryce had realized that tonight obvious sympathy copiously expressed was not the medicine for his father's bruised spirit; hence he

elects to regard the latter's blind-

Bryce reminded him. "I suppose it's been a long time since you've visited the Valley of the Giants; your long exile from the wood-goblins has made you a trifle gloomy, I'm afraid."

John Cardigan nodded. "I haven't seen them in a year and a half, Bryce. Last time I was up, I slipped between the logs on the old skid-road and like to broke my old fool neck. But even that wasn't warning enough for me. I cracked right on into the timber and got lost."

"Lost? Poor old partner! And what did you do about it?"

"The sensible thing, my boy. I just sat down under a tree and waited for George Sea Otter to trail me and bring me home."

"And did he find you? Or did you have to spend the night in the woods?"

John Cardigan smiled humorously. "I did not. Along about sunset George found me. Seems he'd been following me all the time, and when I sat down he waited to make certain whether I was lost or just taking a rest where I could be quiet and think."

"I've been leaving to an Indian the fulfillment of my duty," Bryce murmured bitterly.

"No, no, son. You have never been deficient in that," the old man protested.

"Why didn't you have the old skid-road planked with refuse lumber so you wouldn't fall thru? And you might have had the woods-boss swamp a new trail into the timber and fence it on both sides, in order that you might feel your way along."

"Yes, quite true," admitted the old man. "But then, I don't spend money quite as freely as I used to, Bryce. I consider carefully now before I part with a dollar."

"Pal, it wasn't fair of you to make me stay away so long. If I had only known—if I had remotely suspected—"

"You'd have spoiled everything—of course. Don't scold me, son. You are all I have now, and I couldn't afford to send for you until you'd had your fling." His trembling old hand crept over and closed upon his boy's hand, so firm but free from signs of age until they were ready to settle down to business. And you have enjoyed your little run, haven't you?" he concluded wistfully.

"I have, Dad." Bryce's great hand closed over the back of his father's neck; he shook the old man with mock ferocity. "Stubborn old lumberjack!" he chided.

John Cardigan shook with an inward chuckle, for the loving abuse of his boy had formed a habit of heap- ing on him never failed to thrill him. Instinctively Bryce had realized that tonight obvious sympathy copiously expressed was not the medicine for his father's bruised spirit; hence he

elects to regard the latter's blind-

ness as a mere temporary annoy- ance, something to be considered lightly, if at all; and it was typical of him now that the subject had been discussed briefly, to resolve never to refer to it again. He released his hold on the old man's neck and tapped the latter's gray head lightly, while with his tongue he made hollow-sounding noises against the roof of his mouth.

"Ha! I thought so," he declared. "After your fifty-odd years in the lumber business your head has be- come packed with sawdust—"

"Be serious and talk to me, Bryce."

"I thought to send you to bed without your supper. Talk to you? You bet I'll talk to you, John Cardigan; and I'll tell you things, too, you scandalous bunko-steerer. Tomorrow morning I'm going to put a pair of overalls on you, arm you with a tin can and a swab, and set you to greasing the skidways. Partner, you've deceived me."

"Oh, nonsense. If I had whimpered, that would only have spoiled everything."

"Nevertheless, you were forced to cable me to hurry home."

"I summoned you the instant I realized I was going to need you."

"No, you didn't, John Cardigan. You summoned me because, for the first time in your life, you were panicky and let yourself get out of hand."

His father nodded slowly. "And you aren't over it yet," Bryce continued, his voice no longer bantering but lowered affectionately. "What's the trouble, Dad? Trot out your old panic and let me inspect it. Trouble must be very real when it gets my father on the run."

"It is, Bryce, very real indeed. As I remarked before, I've lost your heritage for you." He sighed. "I waited till you were able to come home and settle down to business; now you're home, and there isn't any business to settle down to."

Bryce chuckled, for he was indeed far from being worried over business matters, his consideration now being entirely for his father's peace of mind. "All right," he retorted. "It was my pleasure, Bryce, to have to let the servants go and give me the continued, 'and you wouldn't up the old home. That part of it is deny me my choice of sport, would settled; and weak, anemic, tenderly you? Remember, lad, I never had nurtured little Bryce Cardigan must put his turkey on his back and go cation; the only real travel I have into the woods looking for a job as ever had was when I worked my way around Cape Horn as a foreman lumberjack. . . . Busted, eh? Did I or did I not hear the six o'clock hand, and all I saw then was water and hardships; all I've seen since is my little world here in Sequoia and in San Francisco."

"You've sacrificed enough—too much—for me, Dad."

"It pleased me to give you all the advantages I wanted and couldn't afford until I was too old and too busy to consider them. Besides, it was your mother's wish. We made plans for you before you were born, and I promised her—ah, well, why be a cry-baby? I knew I could manage until you were ready to settle down to business. And you have enjoyed your little run, haven't you?" he concluded wistfully.

"I have, Dad." Bryce's great hand closed over the back of his father's neck; he shook the old man with mock ferocity. "Stubborn old lumberjack!" he chided.

John Cardigan shook with an inward chuckle, for the loving abuse of his boy had formed a habit of heap- ing on him never failed to thrill him. Instinctively Bryce had realized that tonight obvious sympathy copiously expressed was not the medicine for his father's bruised spirit; hence he

elects to regard the latter's blind-

ness as a mere temporary annoy- civil engineer, I tell you, and my ance, something to be considered studying the installation and con- struction of big plants abroad." He commenced to chuckle softly. "I've been discussed briefly, to resolve never to refer to it again. He released his hold on the old man's neck and would have to be rebuilt, so I wanted to know how to rebuild it. And I've known for years that some day I might have to build a logging railroad—"

"My dear boy! And you've got a comet."

"Partner, I have a string of let- ters after my name like the tail of a comet."

"You comfort me," the old man answered simply. "I have reproach- ed myself with the thought that I reared you with the sole thought of making a lumberman out of you— and when I saw your lumber busi- ness slipping thru my fingers—"

"You were sorry I didn't have a profession to fall back on, eh? Or were you fearful lest you had raised the usual rich man's son? If the latter, you did not compliment me, pal. I've never forgotten how hard you always strove to impress me with a sense of the exact weight of my responsibility as your successor."

"How big are you now?" his father queried suddenly.

"Well, sir," Bryce answered, for his father's pleasure putting aside his normal modesty. "I'm six feet two inches tall, and I weigh two hundred pounds in the pink of condition. I have a forty-eight-inch chest, with five and a half inches chest-expansion, and a reach as long as a gorilla's. My underpinning is good, too; I'm not one of these fellows with spidery legs and a barrel-chest. I can do a hundred yards in ten seconds; I'm no slouch of a swimmer; and at Princeton they say I made football history. And in spite of it all, I haven't an athletic heart."

"That is very encouraging, my

boy—very. Ever do any boxing?"

"Quite a little. I'm fairly up in the manly art of self-defence."

"That's good. And I suppose you did some wrestling at your college gymnasium, did you not?"

"Naturally. I went in for every- thing my big carcass could stand."

The old man wagged his head approvingly, and they had reached the gate of the Cardigan home before he spoke again. "There's a big buck woods-boss up in Pennington's camp," he remarked irrelevantly. "He's a French Canadian imported from northern Michigan by Colonel Pennington. I dare say he's the only man in this country who meas- ures up to you physically. He can fight with his fists and wrestle right cleverly, I'm told. His name is Jules Rondeau, and he's top dog among the lumberjacks. They say he's the strongest man in the county." He unlatched the gate. "Folks used to say that about me once," he continued wistfully. "Ah, if I could have my eyes to see you meet Jules Rondeau!"

The front portal of the quaint old Cardigan residence opened, and a silver-haired lady came out on the porch and hailed Bryce. She was Mrs. Tully, John Cardigan's old housekeeper, and almost a mother to Bryce. "Oh, here's my boy!" she cried, and a moment later found herself encircled by Bryce's arms and saluted with a hearty kiss.

Some Luck

First Burglar—Did you have any luck in that house?

Second Burglar—You bet! I found a packet of love letters and I'll copy them and send them to my girl. That'll win her for me.

A Story for Children

The Discontented Violets

TWO little violets grew by the roadside, along with several companions, but these two were hid- den by a mossy stone. When passersby stopped to admire the beauti- fully cool, deeply colored flowers, the two by the stone would bob their heads and stretch their necks in order that they might be seen. How- ever, no one ever seemed to notice them.

"It's a shame that we are hidden here," said the first violet. "I am sure we are much prettier than those in the sun, for our color is deeper."

"Oh, I wish the grass weren't so deep about me," complained the second violet. "Sometimes I feel all choked and can hardly get enough air."

"Silly," returned the first violet. "We get all the air we need, and the shelter, this stone and this grass give us, makes us much larger and a more beautiful purple."

"I don't care," snapped the second violet. "I want to be where people can see me. It certainly is dull when no one notices us. I wish someone would take me away from here. There is some one now picking those next to us. Oh, I do hope she sees me."

No sooner had the discontented violet said this, than some careless little fingers closed around its stem and broke it cruelly off.

"Oh-oh!" said the little violet to itself. "that hurts dreadfully, and I

feel very queer. But then, think of all I might see and hear. I'm glad to get away from here."

But the poor little dower did not get very far. It slipped from the hand that was carrying it and lay on the ground in the hot sun.

"Oh dear, oh dear, I thought I was lucky, what a careless child to drop me and leave me here in this hot sun."

Another child came along and seeing the violet cried:

"Mother, see this violet. Some one had dropped it. Shall I take it?"

"Never mind, dear. It's withering already. It wouldn't last until we reached home," said her mother.

"How hot that sun is," said the slowly withering violet to itself. "I wish I were in the shade again. Oh, my poor head is withering. I wish—I wish—"

But the little violet could say no more for it was so weak from the heat and afterward it died.

The other violet had heard the re- marks of the child and lady and knew the fate of its companion. Everytime, after that, when voices were heard, it would snuggle down among the grass.

"How nice it is here in the cool place," it sighed contentedly. "I hope nobody ever is heartless enough to take me and leave me in the sun. I'm very happy now, just as I am."

Markets

PHILADELPHIA PRODUCE

—Philadelphia, June 6, 1921.

New potatoes are lower under the heavy supplies. This morning there were about 40 cars of new potatoes for sale, offering a large lot from S. C. N. C. Norfolk and the Eastern Shore of Virginia sections. The Eastern Shore potatoes sold at highest prices, best brand of seed potatoes at \$4.25 per bushel, with some at \$4.50 per bushel. The unbranded Eastern Shore potatoes, the North Carolina and South Carolina potatoes, as well as the Norfolk potatoes, sold at \$3.50 per bushel, with some poorly graded down to \$3.00 per bushel. No. 2 from all sections sold from \$1.50 to \$2.25 per bushel, and No. 3 down to \$1.10 per bushel. With the new potatoes selling at the lower prices, old potatoes are only meeting a very limited demand at the low prices of 30¢ to 35¢ per bushel.

Vegetables—New Jersey asparagus is beginning to draw towards the market for the season, and while there is still some showing quality good enough to command 35¢ to 40¢ per bushel, most sales are made from 10¢ to 20¢ per bushel. The Pennsylvania asparagus is the best on the market, best of which is selling at 10¢ to 20¢ per bushel. With other grades of down mostly 2¢ to 3¢ per bushel, with culls down to 1¢ to 2¢ per bushel. There have been no nearby beans on the market, but they may be expected within the next few days. Norfolk beans sold at \$2.50 per bushel, with some from the green, while the white sold somewhat higher, some bringing around \$4.00 per bushel. Norfolk green beans sold at 10¢ to 15¢ per bushel, while the nearby Penna. and N. J. brought 10¢ to 15¢ per bushel. Most of the cabbage is coming from the present writing from Norfolk and the Eastern Shore of Virginia sections, the Norfolk selling this morning at \$1.00 to \$2.50 per bushel, and the Eastern Shore at \$2.00 to \$2.50 per bushel. Some cabbage from Baltimore sold at \$2.50 per bushel. The first of the nearby Penna. has also made its appearance and sold there this morning early at \$2.00 to \$2.50 per bushel, but the market weakened during the day, and now the general market is \$2.00 to \$2.50 per bushel. Norfolk carrots sold mostly around 2¢ to 3¢ per bushel, while the nearby green carrots are selling at 2¢ to 3¢ per bushel, the wide range of 2¢ to 3¢ per bushel, as to size, some being still quite small. Cuminers in moderate supply and sell from \$2.00 to \$2.50 per bushel for culls and 2¢ to 3¢ per bushel for choice. Eggplants advanced in price today and are now selling at \$1.50 to \$2.00 per bushel. New Jersey lettuce has sold at 70¢ to \$2.00 per bushel and Penna. lettuce at \$1.50 to \$2.00 per bushel. Mushrooms are scarce and sell from \$2.00 to \$2.50 per bushel. Onions are moving very slowly the southern selling from 1¢ to 2¢ per bushel, the northern from 1¢ to 2¢ per bushel. Green onions are making their appearance on the market some selling here today at 70¢ to 80¢ per bushel. Watermelons are scarce and sell at \$1.50 to \$2.00 per bushel. The market requirements at 60¢ to \$1.50 per bushel. The Eastern Shore peaches and Norfolk are more or less neglected and sell at 5¢ to 10¢ per bushel. Apples are scarce and higher at \$1.50 to \$2.00 per bushel. Radishes are selling at 10¢ to 15¢ per bushel. Hops are still on the market and selling at 4¢ to 5¢ per bushel. Nearby tomatoes are in ample supply for the demand at 10¢ to 15¢ per bushel. Spring onions advanced today and are now selling at 15¢ to 20¢ per bushel. Eggplants are scarce and sell at \$1.50 to \$2.00 per bushel. Cabbage was very scarce here today and sold at \$1.50 to \$2.00 per bushel. There was a better demand for nearby sweet potatoes at \$1.50 to \$2.00 per bushel. For No. 1 and 2 and 3¢ per bushel. Watermelons are moving slowly at 15¢ to 20¢ per bushel.

Fruits—Strawberries are in higher supply and prices are quite a little higher than the price which prevailed last week. The best cars of Delaware strawberries sold here this morning at 15¢ to 20¢ per quart. The best New Jersey strawberries sold at 10¢ to 15¢ per quart. Some of the best berries from the Eastern Shore of Virginia are also on the market and are selling at 10¢ to 15¢ per quart. The market requirements at 10¢ to 15¢ per quart. The Eastern Shore peaches and Norfolk are more or less neglected and sell at 5¢ to 10¢ per bushel. Apples are scarce and higher at \$1.50 to \$2.00 per bushel. Radishes are selling at 10¢ to 15¢ per bushel. Hops are still on the market and selling at 4¢ to 5¢ per bushel. Nearby tomatoes are in ample supply for the demand at 10¢ to 15¢ per bushel. Spring onions advanced today and are now selling at 15¢ to 20¢ per bushel. Eggplants are scarce and sell at \$1.50 to \$2.00 per bushel. Cabbage was very scarce here today and sold at \$1.50 to \$2.00 per bushel. There was a better demand for nearby sweet potatoes at \$1.50 to \$2.00 per bushel. For No. 1 and 2 and 3¢ per bushel. Watermelons are moving slowly at 15¢ to 20¢ per bushel.

Butter—Prints, 36¢ to 40¢ per pound; tubs, 35¢ to 40¢ per pound; cooking, 25¢ to 30¢ per pound; Ohio, 25¢ to 30¢ per pound.

Cheese—New York, old full cream, 20¢ to 25¢ per pound; Swiss, 20¢ to 25¢ per pound; Longhorn, 20¢ to 25¢ per pound; Limburger, 10¢ to 15¢ per pound; do 2-lb. 25¢.

Eggs—Fresh select, 28¢ to 29¢; current receipts, 26¢ to 27¢.

BALTIMORE PRODUCE

LEBANON COUNTY NOTES

A large number of enormous, gnarled, knotty oak logs, together with locust, chestnut and cherry are being sawed at the mill east of here. The lumber is used by the surrounding farmers in repairing fences, buildings and in the erection of new dwellings. Some oak logs are so huge that it is almost impossible for the giant saws to begin ripping. A pile of walnut logs also is lying at the railway awaiting shipment. These valuable trunks were bought and gathered by the same person who has made large shipments to foreign countries in the past.

All field crops are doing well with the exception of alsike and red clover which were frozen to the ground and which are unable to renew shoots on account of the timothy and alfalfa which did not suffer very much and which apparently is choking the less hardy grasses.

The cut worm and the blackbird are creating havoc in many corn fields. The increase of blackbirds will have to be checked by the state Legislature very shortly.

Store goods are still too high. Potatoes bring from five to thirty-five cents a bushel. Many old potatoes will have to be dumped onto the manure pile. Eggs, 22c; butter, 36c, as to grade; milk, \$1.65 per cwt.; best fat steers, 8c.—R. I. W.

MARYLAND NOTES

Climatic maps of Maryland issued by the State Weather Service show that the climate of Maryland is one of the most remarkable in the United States for the growing of crops. There are three maps, the first giving the number of days between the killing frost in the spring and the first in the fall. This shows that the average runs from 180 days on the northern border to 220 days in the southern, giving an average of about 200 days when the whole state is taken into consideration. This is one of the longest growing seasons in the country. The second map shows the amount of rainfall in the various parts of the state. The average for the entire state is slightly over 40 inches, which is deemed the ideal amount by agricultural experts. The third map shows the average annual temperature, which ranges from 52 degrees at the extreme north to 57 at the extreme south. The summers here are only slightly warmer than in the north, but the winters are much more mild.

Ten thousand acres of Queen Anne county's land, or about 18 per cent of the total wheat acreage of the county, this year will produce practically no wheat, due to the recent disastrous storm, and unless steps are taken to utilize this vast expanse of fertile lands by the planting of some other crops, production in the county may reach the lowest level in years. The majority of farmers already have as much ground in corn as they can handle to advantage, and agriculturists in the area that was visited by the storm are confronted by the problem of selecting a crop that can be grown this summer. County Demonstrator Oliver C. Jones offers a suggestion that soy beans be grown in the place of wheat, saying that they can be planted as late as June 15 and yet be harvested for seed and followed by wheat in the fall.

At a meeting of the Eastern (Md.) Farmer's Association last week the committee appointed to wait on the Threshermen's Association reported the latter refused to consider their demand for eight cents a bushel.

Power and Light
with the Quiet Knight

The Willys-Knight
Sleeve-Valve Engine

THERE could be no better evidence of keeping faith with the public than this—to share our ability to produce quality products on a quantity basis with everyone in North America who needs electricity.

In the famous Willys Light we have swept aside precedent and given every home the benefit of bed rock quality at rock bottom prices.

At its present low price of \$525 there can and will be no further reduction. Already we are meeting the farmer more than half way—giving him the great advantage of a

practical, complete power and light plant, backed by national resources and service, at an unheard-of price.

This wonderful reduction in price is no more extraordinary than the wonderful service Willys Light is giving hundreds of homes.

The famous Willys-Knight engine is only one exclusive superiority, in addition Willys Light has fifty distinct advantages. These combined with its new low price warrant your immediate action. See your nearest Willys Light dealer or write for booklet.

\$295

—And here is the Electric Plant that will revolutionize farm lighting—Willys Light Junior. Somewhat smaller but in every other respect measuring up to Willys Light quality, this plant is big enough for lights and small power uses. At this low price, you can now have the electricity you have been waiting for.

Willys Light Junior has the wonderful Auto-Lite engine generator, a battery of ample capacity and is of standard voltage.

Wonderful Dealer Opportunities Available

THE FRONT THAT GAVE THE GRIFFIN SILO FAME

Continuous Open Door Front. Permanent steel ladder attached. Size 18' x 20' \$101.00. Size 18' x 24' \$101.25. Size 12' x 20' \$56.00. Other sizes in proportion.

GRIFFIN LUMBER CO.
Box 9 Hudson Falls, N. Y.

CIDER PRESSES

Work up your apple culls into profitable cider, also make good money pressing for others. Our high pressure construction gets all the juice with minimum power and operating expenses. Presses built in sizes suitable for all conditions. We also have a complete line of pumps, racks, cloths, etc. Catalog and descriptive new booklet "By-Products of Fruit" mailed free to orchardists.

Other Farquhar products include: Engines and Builers, Steam and Gas Tractors, Sewing Machines, Potato Diggers, Grain Drills, Cultivators, etc. Write for descriptions.

A. B. FARQUHAR CO., Ltd., Box 146 York, Pa.

AMERICAN CREAM SEPARATOR

On Trial. Easy running, easily cleaned. Skims warm or cold milk. Whether dairy is large or small, get handsome catalogue and easy monthly payment offer. Address: **AMERICAN SEPARATOR CO., Box 5062 Bainbridge, N. Y.**

Green Mountain SILO

Will it YES Stand? Write for Circular. **THE CREAMERY PACKAGE MFG. CO., 345 WEST ST. RUTLAND, Vt.**

Start the Young Pigs Right

By Giving Them

Semi-Solid Condensed Buttermilk

This buttermilk is pure and fresh, taken direct from our churns. It is pasteurized and concentrated to about one-seventh of its original volume by boiling it down at low temperature under a vacuum. Every pound of it is solid food. It contains no indigestible matter. This is the best feed known for hogs or poultry. Send for our descriptive booklet and price list for any quantity desired. Manufactured and sold direct by

J. A. LONG COMPANY, 306 E. Elm Street, Union City, Ind.

The Economy of a Good Silo

Low Prices Received for Dairy Products Increase the Importance of Careful Feeding

By R. H. MECKLENBORG

With the thought of a silo, comes a mental picture of just what is wanted—how much money must be spent and what the returns should be for the investment.

The first and fundamental purpose of the silo

do this. You often see piles of mouldy or rotten silage beside barns during the winter feeding time. The reason for this is that so many silos are not air-tight. They are not frost-proof. Their joints have opened enough to let in the air and the weather, or the material from which the silo is constructed disintegrates from contact with the acid in the silage.

The construction of the walls as to their resistance to cold and moisture, the manner of anchoring and the foundation should all be considered. Almost all silos work well when they are new. They may be alright for several years, but if you go to the expense of erecting a silo, you want that job over for a life time. The person buying a silo should look for service in saving silage, economy in building and long-lasting, long-service qualities.

Corn should be placed in the silo at the time when the kernels are commencing to dent and other fodder before the stems reach the woolly stage. When the fodder is too green, there exists a danger of rotting. If the crops are too ripe and dry, fermentation will not take place unless water is applied in the blower and distributed throughout the mass.

Pea and soy bean vines, clover and alfalfa, should be cut and left on the ground until wilted before being placed in the silo with corn, unless the corn is well matured. In that event, it is best to store them as soon as cut, so to furnish the necessary moisture to start the fermentation.

It is a good plan to drill corn intended for the silo and after the last cultivation, plant cow peas between the rows. The pea vine will climb the stalk and can be put with the corn. The adoption of this method permits of much labor being saved and a fairly well balanced ration being secured. Sunflowers are sometimes added with good results. Millet has not been found to be practical, due to the fact that the stems seem to mould.

When the silo is filled, the top should be covered with a layer of hay or straw which has been run thru the cutter. In some cases oats are sown on top in conjunction with the cut hay or straw and they serve to good advantage as an additional precaution against mould. The top cover should be wet down and made compact.

When the silage is exposed to the air for a few days, it begins to spoil; hence care should be exercised in determining the number of cattle to be fed when the silo is constructed. At least two (Continued on Page 11).

The following table gives the size of silo, capacity in tons, number of acres required to fill it, estimating 15 tons per acre, and the number of cows it will feed six months, giving them 40 pounds daily:

Diameter	Height	Capacity, Tons	Acres, 15 tons per acre	No. of cows
10	20	24	3	8
12	20	40	3	11
12	24	49	3 2-5	13
12	28	60	4	15
14	22	61	4 1-2	17
14	24	67	4 2-3	19
14	26	73	4 3-4	21
14	30	93	6	23
16	24	87	6 2-5	24
16	26	97	7	26
16	30	119	8	30
18	30	154	10 1-5	37
18	36	189	12 1-5	45

is to save. Then if saving is to be the keynote, the place to begin such economy is in the selection of the silo. One should keep in mind the fact that the average silo holds \$500 worth of

Where Conditions Permit it Pays to Have a Silo of Large Diameter for Use During the Heavy Feeding Season and a Smaller One For Other Times

Today the silo is one of the farmer's main fortifications. Economy and efficiency in production are the main problems of those who are trying to adjust themselves to conditions imposed by the falling markets. The silo should be the first consideration. Even bankers in many localities are awakening to the fact that silos are the means of better farming, increased milk and beef production with greater economy and larger farm profits and are advising and in many cases actually helping farmers get silos.

All farmers have learned that they must not pile their grain on the ground if they wish to avoid loss of profits, and many have learned that they are making practically the same mistake by letting 40 per cent of the feeding value of their corn go to waste in the field in the form of stalks, leaves and husks.

corn and if it is cheap and poorly constructed there can be only one result and that is spoiled silage to the extent of perhaps 20 per cent or \$100. No man wants a silo that will not save all the silage, yet there are many that will not

The Trend of Land Values

Crop Values Per Acre Since 1919 Have Dropped Far Below Plow Land Values

POSSIBLY before and certainly ever since Abraham and Lot found it necessary to divide the land to keep their herdsmen from quarreling there has been a land problem. In each passing century it has become more acute. Many of the greatest events, wars, immigrations and political struggles in human history have been based on a land problem.

In the United States one of our chief land difficulties is that of valuation. This has been particularly true in the last twenty years since land values per acre have quadrupled in that period. Farmers who owned or purchased land during this interval have had an income from farming much higher than it would have been if limited to the sale of products grown on the farm.

The accompanying chart gives a picture of the history of land values during the last two decades. The Census of 1919 found them to be a little more than twice as high as ten years before and estimates made since by the Department of Agriculture show that they practically doubled again from 1919 to 1920. Data from the Census of 1920 so far as published bear out these estimates.

Before 1900, land was considered a safe investment because of the stability of prices, but after values had been advancing steadily for several years, it was generally assumed that these advances would continue. Then land was prized as an investment not for the return in the form of rent but because of the expectation of an increase in the value per acre. This went along merrily enough until prices in some sections got so high about 1910 to 1915 that the average return in the form of rent only amounted to about one-half the current interest rate on the market value of the land. Then it became more profitable to rent land than to own it unless a continuous increase in the value per acre were assured. But if the value rose higher it was still more difficult to earn an adequate rate of interest. Also the increased return from higher land value could only be realized upon by selling the land itself. In short it was not a very satisfactory deal for the working farmer.

Finally the war came along bringing higher prices for farm products and eventually starting a land boom which carried land values up to a new pinnacle. Then the collapse in the prices of grain and livestock arrived and average land prices are going down their first setback in a quarter of a century.

What caused the advance in land values, especially that part of it which preceded the war period? Were the conditions at that time temporary or are they of a permanent character?

The principal factor determining the value of land is its earning capacity. Anything which makes farming more profitable tends to increase the price of land.

One reason why land values rose in the pre-war period was that the prices of farm products advanced. Following the crisis of 1893 these prices of farm products remained low for several years, part of the time below cost of production, but about 1898 they began to go higher and after two or three years these higher prices affected the value of the land. Costs of production, aside from rent, also rose but probably with less rapidity. The records of the Department of Agriculture show an increase in the yield per acre of our leading farm crops during the past twenty years of about 15 per cent or over one-half of one per cent a year. With higher prices for farm products and larger yields per acre, naturally the crop values per acre rose. The chart shows that in the period from 1899 to 1909 crop values advanced from an index figure of 37 to 191. Land advanced still more rapidly. Also in the next five years crop values changed but little while land values kept on rising. Evidently other important factors were at work.

This brings us to the second cause of rising land values during the past 25 years. Good plow land had nearly all passed into private hands by

the end of the nineteenth century. Each census up to and including 1900 showed a big increase in the amount of tillable land, but the 1910 census and the 1920 census so far as made public show only small increases. And yet the improved land in farms in 1919 was only 25 per cent of the total land area of the country. Increases now mean, in most cases, the use of less desirable areas. The population, especially the urban population, of the United States has been growing, and the pressure of a growing population upon a fixed land supply inevitably advances the price.

There are instances in which much of the increase in the value of the land has been due to investment of the profits and savings of the farmer in the construction of permanent improvements such as barns, houses, granaries, fences, drainage systems and to clearing the fields of stumps and stones. Lower interest rates during the early part of this century also tended to raise land values and would have done so aside from any increase in the net profits per acre.

Some other factors which have helped to make farming more profitable and eventually advanced land values are: more effective machinery, better livestock, the development of new crops such as alfalfa, the use of silos, better facilities for reaching markets thru railroad extensions or otherwise, and improved business methods in marketing such as producers' marketing organizations. The demand for country homes on the part of city people has been an important factor in raising land values in the vicinity of

come more effective, permanent improvements will be constructed on the farms and in the community. These and most of the other factors which helped to advance land prices in the past will continue to operate. But a generation or two may be required to restore the level of land prices of a year ago.

As we have seen, any factor which increases profits in farming tends ultimately to raise the price of land. Such increases in land value necessarily raise the land charges in the form of interest and taxes to be counted in subsequent costs of production. These charges in turn tend to swallow up what would have been profits. As a result, over long periods farming seldom shows any "profits" above costs of production even though the land values may be rising all the time and the net worth of farmers may show a big increase. This, by the way, is one of the big difficulties to be overcome in a cost-plus plan as applied to farming.

The tendency for land values to advance and absorb the lion's share of any economic betterments in the position of the farmer is almost as old as agriculture itself. Some students of rural economy even claim that farm poverty is due chiefly to over-capitalization of the land.

We can be sure also from a practical viewpoint, that as long as our present economic scheme of land tenure persists, this tendency on the part of land values will remain. For example, the measures now being devised by farm organizations in marketing, legislation, finance or otherwise to improve the farmer's position will exert an influence in the direction of sustaining or advancing land values.

It may be possible, however, to correct one troublesome factor. Farmers in the past have been prone to underestimate costs of production aside from rent and thus to overestimate the earning capacity of the land itself. They have overlooked the labor of the members of the family, or depreciation on buildings, machinery and even depreciation of the land itself. With these items excluded or counted at less than their full worth, cost marks which were too low were obtained and farmers have been willing to pay too much for land.

Putting the price of land too high harms chiefly the farmer. The sufferer from the aftermath of the recent land boom are the young people, the renters and others of small means who invested their savings in land under the mistaken notion that prices would stay high indefinitely and whose finances were smothered out by the decline in both farm products

and farm land. Actual farmers do not want land values to be higher than the price of farm products justifies after all the other elements in the full economic cost of production are satisfied. Nor is it desirable that they should receive a part of their income from farming in the form of a gradual advance in land values if those values are above the point at which the prevailing cash or crop-share rent will pay taxes and a fair rate of interest in the valuation. The farmer or land owner whose land, purchased for \$50 an acre, later rises to \$250 is better off even if he gets only 2 per cent on the higher valuation but even he retires and the land is bought by a farmer who must pay for it from the produce, this man must labor unduly hard and pull his family and himself down to a low standard of living. He is the individual who is hurt.

In brief, there are factors at work which will again advance land values in the United States but it is highly undesirable that they should advance more rapidly than the earning power of the land really justifies.—Glenn G. Hayes.

The highest mountain in the State of New York is Mount Marcy, a peak in the Adirondacks, which rises 5344 feet above sea level. The average or mean elevation of the state, as estimated by the United States Geological Survey, Department of the Interior, is 900 feet.

Crop Values and Land Prices Are Now Out of Adjustment. To Re-establish Agriculture on a Sound Basis They Must Return to a Relationship More Like That Prevailing From 1899 to 1913. It Seems Probable That This Will Be Brought About Through an Advance in Crop Values and Parity Thru a Decline in Land Prices.

the towns and large cities of the United States.

By the end of 1920 the land boom was over and the index figure for land prices had dropped from 202 to 184. The average value of all plow land declined from \$90.01 per acre at the end of 1919 to \$83.78 at the end of 1920. Unofficial reports since the first of the present year point to a further decrease of 10 to 20 per cent since the Bureau of Crop Estimates gathered its figures. The chart shows only the decline in the official estimate.

What will be the future course of land prices? Will the decline now under way continue or will values become stabilized around the present level or will the upward course be resumed?

At the present time land values are unsettled with few farms changing hands. No one wishes to purchase land at high prices if farm products are to stay down. Land has declined much less than grain and livestock. Cash rents for 1921 are probably 50 per cent higher than before the war while prices paid to farmers for their products are no higher than the prewar level. Land and rents must come down or farm products must go up.

Looking far ahead, it is certain that land prices sometime will return again to the high point at the crest of the boom. Population will become more dense, the demand for farm products will increase, methods of farming will be-

Conserving the Peruvian Guano Supply

The Once Flourishing Guano Industry is Again Becoming Important

By J. G. LIPMAN
Director New Jersey Experiment Station

THE FAME of Peruvian guano spread thruout England between 1840 and 1850. Its value as a fertilizer was, however, recognized long before that time in some of the countries of South America. The celebrated traveler and naturalist, Alexander von Humboldt, was so impressed with the results obtained in its use that he was led to bring a quantity of it to Europe in 1840. He also brought back with him stories of the ancient use of guano in Chili, Peru and Bolivia, of the methods used to exploit the deposits of guano and of the laws passed to protect against wasting the supply of this valuable fertilizer.

The term "guano" or "huano" is of Spanish origin and corresponds to the English word "dung." There are many different kinds of guano, distinguished by their place of origin. There are also so-called guanos, such as fish guano, bat guano, phosphatic guano, etc., that differ from the true guano, both in composition and in their value for fertilizer purposes.

The true guanos represent the accumulation of vast quantities of the excrements of gulls and of other sea birds. Mixed with these excrements are the remains of fishes and of the birds themselves. In the dry air of the western coast of South America the droppings of the birds lose their moisture quickly and are thus preserved from decay. Scarcely any rain falls in this region, hence the soluble salts of ammonia, and likewise the other soluble salts, are not washed out. This will account for the large proportion of ammonia found in the best grades of guano.

For instance, the material at one time found on Angamos, a rocky promontory on the coast of Bolivia, contained as high as 24 per cent of ammonia. Somewhat less rich but nevertheless very valuable were the deposits of the Chincha Islands, just off the coast of Peru. Aside from its nitrogen or ammonia, guano contains a high percentage of phosphoric acid and also some potash. The best guanos contain 12 to 15 per cent of nitrogen and the same amount of phosphoric acid. The next grade may contain 5 to 7 per cent of nitrogen and 15 to 20 per cent of phosphoric acid. The still poorer grades contain less nitrogen and more phosphoric acid. The potash content varies from a fraction of one per cent to as much as two per cent, and occasionally even more.

Experiments with Peruvian guano were first made in England in 1840. These were carried out under the auspices of the Royal Agricultural Society, and the results were so promising as to lead to the placing of large orders. Also in Germany and some of the other European countries the remarkable manurial value of guano was soon recognized. By 1850, England was importing guano at the rate of 200,000 tons per annum, and during the period 1840 to 1890 England imported and used a total of about 5,000,000 tons of Peruvian guano. By far the largest supply came from the Chincha Islands, for they yielded in a period of 30 years nearly 10,000,000 tons of high grade guano. In some places the deposits on these small islands were 100 to 200 feet deep and represented an accumulation of many centuries. After the exhaustion of the Chincha Islands deposits considerable quantities were obtained from the islands of Guanape and Macabi. Later the islands of Ballestas, Pabellon de Plata, Punta de Lobos, Huanillos, and others were made to pay tribute to the exporters of guano.

The meaning of guano in the upbuilding of British agriculture is clearly shown by Aikman. He tells us that: "In the consideration of artificial manures, guano deserves the first place. This it does mainly on historical grounds, as it is now largely a manure of the past. Not merely has it been used in agriculture to an extent which no other artificial manure has as yet approximated, but its influence on agricultural practice has been enormous. Introduced into this country about the middle of the present century, it was the first of artificial manures to be used in large quantities. It may be thus described as having introduced the modern system of intensive

cultivation, and given rise to the now almost universal practice of artificial manuring." But before many years had passed the best of the Peruvian guano had become exhausted. Unscrupulous dealers began to adulterate guano with all sorts of worthless materials. Soon farmers found that the once powerful and stimulating fertilizer was no longer as effective, and therefore they turned their attention to newer and more promising sources of plant food, such as nitrate of soda, sulphate of ammonia and phosphate and potash salts. Gradually the imports of guano into England decreased. The high-water mark was reached in 1870 with an importation of 247,000 tons. Ten years later only 58,621 tons were imported. In 1890 there were only 19,000 tons imported and in 1900 the amount was even smaller. In the following twenty years the exports of guano to Europe and North America decreased still further. The total exports to Europe and some of the other countries amounted to less than 21,000 tons in 1915, and of this amount England took 2459 tons. Similarly, the exports to the United States suffered a marked decline between 1918 and 1920.

Soon after 1900 the government of Peru became aware of the fact that the decline in the production of guano meant a very serious loss to the country. A survey showed that the guano-

1917-1918. The estimated production for 1920 is about 82,000 tons, showing that the guano production of Peru is on the upgrade. The farmers of Peru, recognizing the great value of guano as a fertilizer, use it regularly, and the country's requirements are about 70,000 per annum. Beyond that the surplus is available for export. It is gratifying to see, therefore, that the production, which has trebled within the past ten years, is now not only sufficient for meeting the domestic needs but also for making available an export surplus. The same policy continued in the future will make possible a gradually increasing quantity for export to the United States and other countries. To quote Dr. Coker again: "A final application to be made in this connection is not the least in importance. The enforcement of any broad and effective plan of protection of guano birds was confronted ten or twelve years ago with obstacles which one might fairly have considered insurmountable; foreign obligations with their customary difficulties of adjustment; national agricultural demands so exceeding the yearly production as to make temporary curtailment most aggravating to Peruvian agriculturists; restive political conditions such as usually demand the service of the present rather than of the future. How do such difficulties compare with those which confront the production of fresh-water mussels or the development of the oyster industry in the Chesapeake Bay, for example?" Surely, thoughtful men might well apply the lesson in the service of some of our own natural resources.

EASTERN AGRICULTURE

Secretary of Agriculture Wallace in a recent statement said: "Eastern agriculture has the opportunity of regaining, in large measure, what it lost half a century ago when the prairies came under the plow and flooded the Eastern markets with agricultural products. The grasping of this opportunity will bring a large measure of profit and stability to Eastern agriculture, not only, but to manufacturing and commercial interests as well. High freight rates give Eastern farmers an advantage over the great agricultural regions of the West in supplying foodstuffs and raw materials to the great centers of population along the Atlantic seaboard. It follows, therefore, that industrial and mercantile interests should give all the assistance they can toward enabling Eastern farmers to take advantage of the present situation by building up a more permanent and more self-sufficient agriculture. I urge this, not merely as a matter of service to the country but as good business. The manufacturer who, in this wise, casts bread upon the waters will see it return to him beyond any shadow of doubt.

"I realize that a short-sighted view of the situation might show it in a different light. Naturally, manufacturers would like to see a reduction in the prices of food products and raw materials. At the same time, they wish to extend their own foreign markets as far as possible. In the short view, it might seem to their advantage to send shiploads of their manufactured goods to the great food-producing countries south of us and to bring those ships back loaded with food produced on cheap land and by the cheapest of labor. No one can deny the temporary enlargement of our foreign markets for manufactured goods to be gained in that way. But that advantage, and a great deal more with it, would be lost thru the weakened buying power of our own agriculture and, in no great while, the country as a whole would have to pay a heavy penalty.

"Let us not be deluded by the fact that just now there appears to be a surplus of food products and the raw materials of manufacture. The production of large crops coincided with greatly lessened consumption, both in this country and in other principal countries of the world. Before the war consumption was rapidly overtaking production. That tendency was not reversed by the

The Clover Failure

FARMERS in the Middle Atlantic States find, as harvest approaches, that their clover crops are far below the average condition. In many instances fields which looked promising at the close of winter show no clover at all now. It is generally believed that the freezing weather at the close of April and the early part of May killed the tender plants which had been pushed rapidly by the previous warm spell. The failure of a clover crop is a serious matter because the farmer is deprived of an important source of protein and loses a valuable soil improver. Those who have planted soybeans will have a good substitute for both these uses. It is still possible for those who have not done so to plant an early variety at once and secure a good crop of valuable forage, providing frost does not come too early.

George P. Hampton

GEORGE P. HAMPTON, Managing Director of the Farmers' National Council, died suddenly at Washington a few days ago. For a number of years Mr. Hampton has been among the foremost of the farm leaders in this country. He was a born fighter and while lending his assistance to many popular movements of farmers he frequently stood with the minority in the championship of others which were considered radical by the more conservative. He believed that organized labor and farmers had many common causes and was promoting a plan by which farmers and consumers might deal direct. He strenuously opposed the Cimmmins-Esch Law and urged a two-year extension of government operation of railroads. Even those who disagreed with Mr. Hampton acknowledged his unusual ability and his honesty of conviction. The following is quoted from an eulogy prepared by U. S. Senator E. F. Ladd:

"Many men are admired for their ability and keenness of intellect. George Hampton was loved by thousands because, in addition to these qualities, he possessed a heart and a conscience. If a thing was right, that settled it. He would fight for it to the end, even tho he fought alone, even tho it cost him every cent he had. It was his heroic courage, his burning sincerity, his utter unselfishness, and his unswerving fidelity to democratic ideals that endeared him to all who knew and worked with him. He was never known to compromise with iniquity or injustice. And yet in the midst of the fray he kept sweet. Altho he hated evil, he loved men, and had the wisdom to condemn the system which makes men bad rather than the men who are themselves the victims of the system."

Pennsylvania Farmer

Women on School Boards

AS THE SEASON approaches when candidates for local offices will be nominated, we wish again to urge the nomination and election of women to school boards. Some of the fundamental weaknesses of the rural schools are things which the feminine mind is best fitted to correct. She is the acknowledged leader and director in the establishment and conduct of a home, and many elements which go to make a well-ordered home are found in a well-conducted school. These factors can not all be furnished by female teachers alone, any more than a wife can make a successful home if she has no voice in equipping and maintaining it. There are such homes—so-called—but they are failures, just as many schools are failures because women are not given a voice in the management.

If there is one public activity where politics should not be in evidence it is in the management of our schools, yet in some districts we find as much log-rolling and peanut-politics as is found any place. As long as this condition is allowed to continue and men are permitted to make the office of school director simply an adjunct to a political ring, the education of the children will suffer and the schools remain a reproach to our generation. We are firm in the belief that women will ever place the welfare of their children above the interests of partisan politics.

Seeing is Believing

ONE of the modern farmer's methods of learning is going to see. The steadily increasing number of "tours" taken by farmers to see what other farmers are doing, and to observe the results of station experiments, is not only a pleasant but profitable custom. The farmer who never sprays, for instance, is convinced of its value when no amount of argument would convince him. Tradition and custom fasten ideas in our minds and they are hard to change, but we all have confidence in what we see, and when our eyes behold the results which follow certain causes most of us are willing to accept them as true. Of course there are a few people who will not then be convinced, such as the old gentleman who declared "there ain't no such animal" even while he stood looking at a camel. If the primary cause of the development of most neighborhoods noted for good farming could be traced, we would find, in most instances, that the good methods were adopted and practiced first by one or more progressive men. These methods were gradually adopted by their neighbors after they saw the results, even tho they may have scoffed at first.

For this reason we urge all who can possibly do so to take a day or two off whenever there is an opportunity to join a tour of inspection. The information gained will, in most instances, more than repay the time and expense; besides, the change and the social features are well worth the effort. Remember, "Seeing is believing."

False Prophets

WE DO NOT wish to ridicule those who, last year, advised farmers to hold their wheat for \$3, or those who prophesied a "farmers' strike" when the bottom fell out of the markets, or those who declared that agriculture was bankrupt and that farmers would be unable to continue, but we would like to know just how they stand in the estimation of those who were misled by these false prophets. It is to be hoped that since none of these things transpired the ridiculous position in which the prophets find themselves will be sufficient to teach a lesson in caution and humility. The harm done to the whole cause of agriculture is not offset by the cheap notoriety gained at the time. Not only did the talk add to the discouragement and uncertainty of farmers, but it placed them in a false position before the public and created a sentiment that is bearing fruit in the form of opposition to needed legislation.

Farmers did lose money in the price slump but they did not go bankrupt. They were "sore," and naturally so, but there was no strike, as the present acreage shows. All farmers knew as well as the would-be prophets just what troubles existed, but events show that the rank and file were made of better stuff than were those who saw nothing but dire disaster ahead. This criticism is not directed to the real leaders in agricultural progress—those who have a vision of better things and the intelligence to fairly estimate the relations between cause and effect—but we are interested in stopping the clutter of those whose chief stock in trade is spreading gloom and pessimism. Agriculture, like other industries, needs helpful, constructive criticism and leadership in these critical times.

The Plum Tree

A PROMINENT public man once said of office-holders that "few die and none resign." That is not only still true, but we have added a smoothly-working system of multiplication by which the number of "public servants" is continually increased. The Federal Government finds it difficult to get rid of the great army of people employed as emergency helpers during the war. There are tens of thousands still on the payroll because it is politically inexpedient to discharge them. Departments, bureaus, commissions, committees of every kind and form have been established in national, state, county and municipal governments until the total number of people employed by the public forms a large percentage of the population. Is it any wonder that taxes are high and still climbing? This tendency is likely to continue until the people stop running to state and national governments for help which they should render for themselves. Self help is the best help, and usually much cheaper.

Our Washington Letter

Hearings on the French-Capper truth in fabric bill, before a sub-committee of the Senate Interstate Commerce Committee of which Senator James P. Watson of Indiana is chairman, have been in progress during the past two weeks. The bill has the support of all the farmers' and wool growers' organizations, the cleaners and dyers, the women's clubs, and many fabric and clothing manufacturers and dealers. It is opposed by certain large woolen and shoddy textile and clothing interests.

Dr. T. C. Atkeson, Washington representative of the National Grange, declared that opposition to the truth in fabric bill came from those who desire to profit by subjecting the public to the necessity of buying commodities which are not what they are represented to be. "Nobody wants to prevent the use of substitutes for wool. We as consumers merely desire to know what we are buying," said Dr. Atkeson. "Like the pure-food law this is a measure which will be practically self enforcing."

J. F. Walker, of Ohio, said the bill was to prevent the debasing methods which have been resorted to by the textile makers during the last three years. J. M. McDowell, representing sheep associations in Ohio, West Virginia and Pennsylvania, declared that "honest men won't object to labeling their goods with what they actually contain, while other fellows ought to be made to do it."

Friends of the bill gave conclusive evidence that the wool producers would be at the mercy of the shoddy manufacturers so long as the dealers were permitted to sell shoddy fabrics as "all wool," and that if this practice is continued it will mean the ruin of the sheep industry.

A bill by Senator Capper of Kansas to include the secretaries of agriculture and commerce as members of the Federal Reserve Board, has been endorsed by the senatorial agricultural bloc. The bloc also proposed at its last meeting the reduction of Federal Reserve rediscount rates and time extension on agricultural paper. Senator Smith of South Carolina has drafted a bill amending the Federal Reserve act to make the time limit on agricultural loans one year instead of the present six months' limit when secured by warehouse receipts. Senator Smith has discussed with President Harding the matter of reducing the rediscount rates on agricultural paper, and the President has given him assurance that this proposition is receiving the attention of the administration in the most effective way possible.

"Bloc" is a recently imported word, the term in European parliamentary usage meaning the solidification of members of like mind, all representing a certain interest with a compact organization. It is now applied to such inter-congress organizations of senators and congressmen advocating certain principles and legislation.

There have been such consolidations of interests in Congress before. In fact, the idea is not a new one. But it is only since the senators and congressmen from the great agricultural states have organized for the purpose of acting together in the promotion of legislation which will give the farmers equal opportunity with other classes, have the newspapers and writers employed by the big interests discovered that the "bloc" idea is a menace to the country and should be suppressed.

A bill introduced by Representatives Tinscher of Kansas is now under consideration by the

Pennsylvania Farmer

House Committee on Agriculture. This bill provides that the Secretary of Agriculture shall investigate, determine and pay the amount of the actual loss sustained by farmers and grain dealers who owned actual crops of the 1917 crop, and lost by the Food Administration's price fixing policy. The measure of such actual loss is placed at sixty cents a bushel, the difference in the market price of wheat at the time the Hoover order went into effect and the price fixed by the Food Administration.

In the discussion it was asserted that the co-operators and coal mine owners, coal dealers and other interests had an equally good case against the government because of Federal price fixing during the war.

Hearings on the Capper-Volstead farmers' co-operative marketing bill are developing some convincing testimony in favor of the bill in the Senate judiciary committee. Secretary of Agriculture Wallace has addressed a letter to Senator G. W. Norris, chairman of the Senate Committee on Agriculture, in which he says:

"I asked the solicitor of the department to give me his opinion on the legal questions covered by the bill. He advises me that he does not find anything in this bill that will permit agricultural associations to do any of those acts forbidden by the anti-trust laws and that, apparently, the only purpose of the bill is to free co-operative associations from the implied restrictions contained in Section 6 of the Clayton act and by thus freeing them putting them upon the same basis as corporations and associations engaged in any other line of business."

"As the bill passed the House, it would not authorize an association of agricultural producers to engage in unlawful restraints upon trade or to form monopolies or to do any other things forbidden by the anti-trust laws. It simply permits farmers to form co-operative associations, with or without capital stock, for the purpose of collectively processing, preparing for market, handling and marketing in interstate and foreign commerce their agricultural products, and it authorizes such associations to have a common marketing agency."—E. E. Reynolds.

HARRISBURG LETTER

Seed Law Plans.—Continuance of the strike at the State Printery is affecting operation of the proposed new seed inspection law and other measures concerning agriculture which are to become operative in the next ninety days and state officials are in a quandary how to meet a situation never before encountered in state affairs. The law requires all printing to be done by the man having the state contract and the few job printing plants hereabouts which could handle any work sent to them as an emergency proposition have so much ahead they cannot undertake it even if so inclined. As a consequence the seed trade has been unable to get copies of the new law, which has some provisions very different from the act of 1913, and there are many people interested who cannot be supplied. The department's facilities for mimeographing are unable to meet the demand and unless the state can get the laws printed there may be some delays in securing full enforcement. It is probable a ruling will be made in a day or so in the matter. The nursery inspection law and other amendments to laws relative to agriculture are being similarly retarded and the policy in regard to the seed law may determine what will be done with them.

The Gasoline Tax.—Preparations are being made for collection of the state tax on gasoline after September 1 and as a preliminary names of persons and firms dealing in gasoline are being assembled by Auditor General Samuel S. Lewis, who says he will have the mercantile appraisers do that work instead of employing people especially for the purpose. The dealers will be required to make sworn statements of sales and to pay the taxes on such basis, the state having authority to make investigations where it is found or suspected frauds are being carried on. Half of the tax will go to the county where collected, which will mean money will be forthcoming in thousands for many of the counties for maintenance of roads or payment of interest or sinking fund charges on highway loans.

State Funds Low.—The general funds of the state are away down and while some school districts are objecting strenuously because they are not receiving their shares from the State Treasury it may be weeks before enough money accumulates to meet the payments. As indicated some years ago the continual creation of special funds, such as the automobile license revenue which is earmarked for roads; hunters' licenses, banking examination and other fees, devoted to specific purposes, is bound to cause a decline in the funds applicable for payment of appropriations.

This is one of the reasons why the administration hunted up new sources of revenue instead of cutting down expenses. The trouble is the revenue of the state is so closely appropriated that any increase is caused at certain seasons when no taxes are payable. There are various funds bulging with money which cannot be used for general

purposes, while school districts are asking for money to meet bills.

Adjustment Bound to Come.—In spite of criticism of the new auditor general's drastic policy of cutting down his force it is evident some readjustment of the Capitol situation in regard to employees is bound to come. The Governor has taken cognizance of the extravagance in his call on department charges, including automobiles and long distance telephones, and now some heads of departments have been asking what people are being paid in other states and in business for much the same duties as they perform in Pennsylvania. The Governor is said to contemplate making at an early day a commission under terms of the government and recommend where departments can be merged. It will be a legacy to his successor.

More Road Work.—Altho the state has over six hundred and fifty miles of road under way and has finished 100 miles this year there is to be no let-up in the construction projects. Bids for ninety-three miles will be opened next week and it is the plan to ask for more bids later on. The state will sell \$15,000,000 of road bonds this month, all of which will go into construction on primary roads. By the end of summer Pennsylvania will have more road work under way than any state in the country.

Interstate Inspection.—Under terms of acts passed by the last Legislature the State Bureau of Markets will be in charge of inspection of interstate and intra-state shipments of foods within its province. This is a notable step in advance and will enable the authorities to check shipments which fail to meet Pennsylvania requirements. The Bureau will also get the benefit of special fees coming to it which will be paid to the state and placed to its credit for maintenance.

Department Budget.—The Department of Agriculture's budget is being made up by Secretary Fred Rasmussen. After the passage and approval of the general appropriation bill the secretary is required to apportion the funds available and lay out the work. This business-like arrangement is required in the act reorganizing the department passed in 1919 and the department is run on that principle.—Hamilton, Harrisburg.

NEW YORK LETTER

Painting Farm Buildings.—Scarcity of work in the cities has led many workmen to swing the brush in painting farm buildings. Paint manufacturers are making special bids for farm trade and are offering credit on paint orders. A survey of one leading farm county shows total 71 per cent of its farm buildings have not been painted in five years.

Maple Syrup Association.—The Cortland County Maple Syrup Association has sold 2500 gallons of syrup to the D. L. W. railroad's dining service. The association is gradually disposing of big stock on hand, in drums, gallon cans, or glass bottles, at around \$2 a gallon, varying with the containers used.

Milking Machine Rules.—Uniform regulations prescribing the best manner of operating and cleaning milking machines are to be formulated by a committee named at a recent meeting of Farm Bureau managers at Geneva Experiment Station. The station leads in teaching correct methods of using the machines. The committee includes farm bureau agents, representatives of the Dairymen's League, the state college of agriculture, the experimental state and the New York City board of health.

Teams Cheaper Than Rail Service. A carload of sand was delivered by mistake two miles from its destination in Cortland County. The railroad officials wanted \$50 to move it the two miles. Teams were hired to haul the sand more cheaply than the railroad would do it. This accounts for a good deal of the hard times of the day when transportation fees are too exorbitant to permit normal business.

Rural Health.—Cortland County has been selected for a rural health survey by the State Department of Health and the State College. Experts are securing data and holding health meetings in all the communities of the county.

New Troops of State Police.—Trained men and equipment are being gathered together in Malone to make up the new troop of state police. They will patrol seven northern counties.

Field Days.—Three days of sports and crop and animal inspection are scheduled for the summer Farmers' Week at Cornell on June 23, 24 and 25. About 10,000 farmers are expected to learn new methods and enjoy a period of relaxation.

Farmers' Questionnaires.—The farmers of the state are filling out questionnaires which will ex-

press to the A. F. B. L. their wishes on a number of matters of agricultural policy. The ability to do this all over the country proves the great value of the Farm Bureau in determining farm action to consider such opinion.

MARYLAND LETTER

The champion steer of the Lancaster County Feeders' Show, at Lancaster, Pa., selected for prize from 1305 cattle, has been on exhibition here for the past ten days at one of the amusement parks where it has attracted considerable attention. He weighs 1,310 pounds and was sold at auction to the Schluderberg & Kurder Packing Company of Baltimore at a record price for cattle on hoof—\$757.10, or 67 cents a pound. The backing company bid on the big animal after a spirited contest with about 1000 packers and butchers.

The weather the past week has been decidedly favorable for the crops, according to the report of the state weather bureau, but, altho all were in excellent condition a little rain would be beneficial. Wheat is ripening and rye has headed in Western Maryland. Wheat is doing particularly well on the Eastern Shore, and oats in the southern counties are beginning to head. Peas and strawberries are being harvested in every section excepting the southern counties, where the crop is about exhausted and in Western Maryland, where it is maturing. Tomato acreage, the report says, will probably be below normal this season, but that of sweet potatoes will be large.

The supplying of a carload of wool to be made up into blankets is the aim of the sheep raisers of Baltimore County this year. The success of disposing of wool last year direct from producer to the consumer has encouraged the farmers to continue the practice, and at a meeting last week at Towson, arrangements were completed for sending all the wool in county direct to a mill, have it made into blankets and rugs and sold thru the office of County Agricultural Agent Edward E. McLain at Towson.

The Howard County Farmers' Association, meeting at Ellicott City last week fixed the rate for threshing wheat at five cents per bushel. Seven cents per bushel was charged last year. The cut is attributed to decreased costs of labor and materials.

According to the Census Bureau report there were 103,027 sheep on the farms of Maryland on January 1, 1920, as compared with 237,137 on the farms on April 15, 1910. No reason is suggested for the great reduction. The report shows that there were 373 goats on farms January 1, 1920; 43 kids under one year, 190 goats one year old and over raised for fleeces and 640 is the number of "all other goats."

NEW JERSEY NEWS

Milk Reduces Ice Cream.—A reduction in the wholesale cost of milk in New Jersey has caused manufacturers to cut the cost of ice cream. Retail prices of the delicacy at Perth Amboy in Middlesex County, North Bergen in Hudson County, and Trenton in Mercer County are fifty and sixty cents per quart. The wholesale prices are \$1.20 per gallon in Perth Amboy and Newark and \$1.15 in Trenton. It has been stated, that at the present time, it is probably costing the average retailer about 30 cents per quart for bulk ice cream. Where ice cream is selling for 15 cents per dish, and seven or eight dishes are obtained from a quart, the gross profit, it is said, would be from 200 to 300 per cent. It is claimed, that there is a large surplus of milk in this state, and that one of the objects in reducing the price of the lactical fluid, was to increase the consumption and avoid waste.

New Jersey Income Tax.—Of much interest to agriculturists is a part of an address given before the taxing officials from all over the State at the State House by Frank B. Jess, of Camden, president of the State Board of Taxes and Assessment, who stated that the 1921 Legislature took the first step towards the elimination of the tax on personal property, and that it made this move by directing the Special State Tax Commission to draft legislation for the taxing of incomes, as a substitute for the personal property tax. This commission has before it the work of providing for a tax on incomes of persons in New Jersey above \$1000 at a sliding scale not to exceed six per cent per annum with exemptions similar to those allowed by the Federal Income Tax Law. This legislation is to be submitted in the form of a bill or bills at the 1922 session of the Legislature, and, if passed, will go to the people for approval or rejection at the November election in that year.

Inspect Potato Fields.—Members of the Mercer County Board of Agriculture, the agricultural committee of the Trenton Chamber of Commerce and other persons in Central New Jersey interested in farm crops and produce, participated in an automobile run and inspection of the potato fields in this part of the state. Prof. Alva Agee, secretary of the New Jersey State Department of Agriculture, and Dr. W. H. Martin, took part.

Butter Production and Consumption

HOW many dairymen know where the bulk of creamery and farm butter of the United States is produced and where consumed? In compiling answers to this question the National Dairy Council has secured some very interesting and valuable material. United States Census reports, Department of Agriculture reports and information gathered from colleges, State Dairy Commissioners, and the general trade have been the basis for all compilations. No effort has been spared in making the work as accurate as possible. However, slight revisions may be made when the census reports are made final on farm butter by states.

In 1909 the farm butter of the United States totaled 994,650,000 pounds; creamery butter 624,764,000 pounds. In 1919 farm butter had decreased 28 per cent in volume, or to 710,000,000 pounds; that of creamery butter had increased 39 per cent, or to 866,850,000 pounds.

Butter consumption in 1909 was 173 pounds per capita. In 1919 the per capita consumption had decreased 15 per cent, or to 14.55 pounds

creamery butter produced annually in the United States.

Our seven heaviest creamery butter producing and exporting states are as follows—North Dakota, South Dakota, Nebraska, Kansas, Minnesota, Wisconsin and Iowa. They manufacture more than half of the creamery butter made in the United States.

While the southern states do not have a large number of dairy cows, this section manufactures more than one-half of the farm butter of the country. Their total make of creamery butter is less than 33,000,000 pounds, or an amount equal to one-fourth the manufacture of the creamery butter of Minnesota. All of the southern states are importers of creamery butter, tho not to as high a degree as the eastern states, due to their lighter population.

Of the northern states, Illinois, Utah, Wyoming and Montana import from seven to thirty per cent of their consumption of butter. Production of creamery butter varies by states in proportion to population, from Minnesota, which produces fifty-four

Leto's Rosette 48858, Champion Ayrshire in Class E and a Gold Medal Winner. Record, 16,448 Lbs. Milk and 650.11 Lbs. Butterfat

per capita. By applying these average consumption figures by states, according to population, the heavy consuming area is found in the eight eastern states—Massachusetts, Connecticut, Rhode Island, New York, Pennsylvania, New Jersey, Delaware and Maryland.

This district is approximately equal in area to New Mexico, which has a population of only 360,350. These eight eastern states have a population of more than 30,000,000, nearly one-third of the entire population of the United States. The bulk of the population of this section is further centered on the coast area. Heavy market milk demands on local supplies in this thickly settled district result in a low creamery butter production of approximately 28,000,000 pounds. Their consumption of 441,000,000 pounds makes necessary the importation of more than 83 per cent of their butter from the big creamery butter producing states. It will be noted that this total consumption of 441,000,000 pounds is more than one-half of the total

EXPERIENCE WITH A MILKING MACHINE

My experience with a milking machine dates back some three years, at which time we purchased one. We installed it in our barn and operated it with a two-horse power gasoline engine for a few months, and then installed an electric motor, and have had it in constant use ever since.

Now, one of the important arguments in favor of the machine is its sanitary features. Bacteria is carried on dirt, and the way to get it out of milk is not to let it get in. A milking machine draws the fluid directly from the cow's udder thru a rubber tube into a tightly-closed pail, and it is impossible for impurities to enter. Great care is required in hand-milking to avoid getting scales, or hairs, or other impurities

into the milk. So much for the sanitary feature.

The chief advantage to the dairyman is the economic one, and consists of the saving of time and labor. A dual unit machine will milk twenty cows in less time than two men will by hand, and with less excitement to the herd. Three years ago the initial expense of installing the machine did not exceed \$300. The overhead expense for the time the machine has been in use has been but a few dollars.

One thing that must always be kept in mind is that care and cleanliness must be observed, but really not any more so than with other up-to-date dairy utensils. Today, the demand by city people and everybody else is for clean, pure, wholesome milk, and, as a rule, the purchaser is willing to pay for that class of product. The dairyman who is prepared and willing to give his herd and machinery his painstaking care need have no fear of not having a market for his product. The care required in keeping a machine milker in proper condition is not any greater than is required for a cream separator, and most any man or boy with ordinary intelligence can learn to operate the milking machine in a few trials.

The cows, as a rule, prefer the machine with the teat cups to hand-milking. But the person who is not willing to give his cows and utensils the most thorough care and attention would best not have a milking machine, and, indeed, such a person had better not have a herd of cows at all. I am unable to give the exact cost of electric power for the operation of the machine, for the reason that we have not had a meter separate from that thru which the current for light for house, barn, cellar, milk room and washhouse is measured. The whole expense for such current does not exceed \$3 per month taking an average of the year around.—J. G. Foight (A Civil War Veteran)—Westmoreland Co., Pa.

NEW STATE CHAMPION JERSEY COW OF MARYLAND

Victoria of Fairview Farm 324039 qualifies as the new state Jersey champion of Maryland. She produced 14,136 pounds of milk yielding 724.55 pounds of butterfat, starting test at five years and one month of age. Her sire is Lou's Torono 106614, a silver medal bull. Her dam is Garden Flower's Victoria 279262.

UNION COUNTY NOTES

The price of \$1.50 is bringing about all the wheat to market which was held for better prices. Growing wheat has some rust and small heads which does not promise as big a crop as earlier indications did.

Corn is selling at 60 cents, but there are only a few buyers for it even at that price. Germination of corn in fields is very good, and corn is being cultivated, tho there are still some fields of corn to be planted. While the showers are making a good growth in grass fields, yet one sees very few good clover fields, tho the growth of clover in wheat stubbles last summer was better than usual. The question is, what became of the clover? Can some one explain.

It makes no difference if the stubbles were mowed, pastured or the growth was left to die on the ground.

Since threshers talk of charging the same high rates for threshing as last year, some farmers are thinking of buying outfits of their own.—J. N. Glover.

No More Reason why You Should Milk by Hand than Harvest by Hand

The De Laval Milker

saves more time during a year than a grain binder or any other labor-saving device a dairyman can own. In addition it increases the production of milk, many De Laval users say, to such an extent that the increased flow alone pays for the milker.

EASY TERMS can be arranged so that you can use the De Laval Milker while it pays for itself. Send for complete information.

Green Mountain SILOS
FREE STABILITY COUNTS
Your Green Mountain Silo, with the popular hip roof, will never need an apology. It is built to stand up permanently—just as any other farm building is expected to do. Every groove and joint is made to fit—both for permanence and silage protection. Every silo is treated in creosote preservative. Hoops are of extra heavy steel with rolled (not cut) threads. They cost us more but they stand unusual strains. Doors fit like a glove—always tight. Wooden ladder runs; no iron to frost the fingers. Green Mountain Anchorage system holds silo absolutely firm and upright. A beautiful silo—with nut-brown side walls and bright red cedar roof. Write today for detailed circular. Special inducements for early orders.
CREAMERY PACKAGE MFG. CO.,
345 WEST STREET, RUTLAND, VT.

The clever door-fastener is also the famous safety ladder
UNADILLA SILOS
The door frame of the Unadilla Silo gives a continuous opening through which you shove the silage instead of pitching it overhead. This saves work. The door fasteners form a convenient, permanent ladder of wide, low "safety" rungs directly under the opening. This gives safety and convenience. Doors open automatically by raising these fasteners.
The hoops are all easily adjustable from the ladder. This gives long life to the silo and perfect protection for the silage.
Two Unadillas are purchased in the East for every one silo of any other kind. Get a Unadilla, one money, make your work easy and safe. Write for our catalog giving full particulars. Also for early order discount and agency offers.

DIG POTATOES THE FARQUHAR WAY

It means more potatoes and in better condition with a considerable saving in labor. Farquhar diggers are built to stand the strain of hard, continuous usage. They dig clean and leave the potatoes convenient for picking.

Elevator Digger illustrated above is built in three sizes with special equipment to suit different soils. Engine drive on large digger if desired. The No. 1 Elevator has paid for itself in one season on four acres of potatoes for some users.

Our "Success Jr." is the peer of plow diggers. Gets more potatoes in one time over the row than a turn plow in three trips. Price so low that it is in reach of the smallest grower. The "Gilt Edge" for those who desire a more elaborate Walking Digger.

Special catalogue giving full particulars of the different Farquhar Diggers sent free on request. Write us today.

HORTICULTURE

FALL SET STRAWBERRY PLANTS

"What do you think about setting out a patch of strawberries this fall for the 1922 crop?"

This is a question that comes to me pretty often just in the middle of the strawberry season or soon after. The reason for this is probably the fact that the strawberry is one of the most delicious fruits and during the season for the berries one wants to have his own patch on the farm for another year. Certainly I don't blame anyone for that either.

But fall is not the best time to plant a strawberry bed according to my experience. We have tried many times to replace a variety that showed up as inferior and of course didn't know about it until after the fruiting season was over. Then we destroyed the unfruitful plants and planted a tried-out variety from the bed that had just fruited. But not over 25 per cent of the plants lived and they required extra care to get that amount to pull thru. More than that they were never good healthy plants and the rows didn't fill up with runners.

Now when I want to get plants for an extra variety I don't get them but wait until the next spring. Then I am just as far ahead as I would have been if I had planted the fall before.

One can have considerable success with fall set plants however, if there is plenty of water to use on them in the fall when it usually is so dry. But farmers are seldom equipped with any irrigation and this is not practical. One can also buy potted plants. These are expensive but they usually grow pretty well. They do not equal the spring set plants but are a good substitute. For the farmer's garden they are possible and fairly practical.

A strawberry requires a season to grow in and another to fruit in. One can't get around this. The plants cannot be expected to fruit the first year but all blossoms should be taken off before they mature fruit. This allows the entire plant energy to go to setting plants and producing runners for the following year.

Fall set plants are necessarily taken from vines that have fruited. Their energy has been directed toward producing fruit and not toward vines. This alone is reason for an unsatisfactory stand of plants. But when this is coupled with trying to get a plant to adjust itself to a new soil at a time of the year when nature doesn't figure on adjustments and when there is a shortage of rains to help the plants adapt themselves to the new soil, it is pretty sure to be a failure.

For the farmer who wants a small patch of berries that will produce a part of a crop the first year I would suggest Progressive everbearing plants. This variety is practical on a small scale at least and will mature fruit the first year and keep at it for a long season—sometimes four months where we are located.—E. R., Ohio.

DEFOLIATED CHERRIES

I have several hundred cherry trees (Early Richmond and Montmorency) and the leaves are all yellow as if it were fall. Can you

thru your paper tell me cause and remedy for same. They are about 20 years old and have not been ploughed or cultivated the last 6 years. Last year a good crop—this year full of blossom but got froze out (no cherries).—W. P. P., Burlington Co., New Jersey.

If the varieties involved in this case were sweet instead of sour, we would need only one guess in order to name the trouble. As it is, we may need several guesses, on the basis of the information at hand, and even then we may not hit the exact cause of the trouble.

If the cherries were sweet instead of sour, we would say at once that the trees were affected by the leaf-blight or yellow-leaf disease, which is caused by a fungus now known as *Coccomyces hiemalis*. This disease is very common all over the world, wherever the sweet cherry is grown, and is a real pest, both in nursery and orchard. Under especially favorable conditions for the disease-producing organism, the most susceptible varieties are completely defoliated very early in the summer, thus greatly weakening the tree and reducing its chances of passing thru the winter safely and especially reducing its chances of setting a crop the following year. This defoliation may occur any time after the last of June.

It is possible that this is also the trouble in the present case, but if so, it is doubtless being caused by a very similar organism, known as *Coccomyces lutescens*, which is, however, much less common, but which affects the sour cherry tree chiefly when it does appear. In either case, the disease usually appears on the leaves toward the last of May or early in June. At first the affected leaves show slightly discolored, dark-blue spots on the upper surface.

These spots are not more than an eighth of an inch in diameter, and they may either be scattered over the whole leaf or be confined to a small part of it. Within a week or so, the diseased spot becomes dark-red or reddish-brown in color, after which the spot either drops out leaving a circular hole in the leaf, or the whole leaf turns yellow. The latter development is much the most common in the cherry, while the shot-holing effect is most common in an allied trouble on plums.

The usual methods of control are to get rid of the affected leaves after they drop to the ground—since the disease passes the winter in these leaves—and to protect the developing leaves during the growing season. Raking and burning or plowing under will do much toward accomplishing the former, but neither is 100 per cent efficient. Spraying with lime-sulphur or Bordeaux mixture, 4-4-50, will protect the developing leaves. The applications advised are: (1) when the calyx drops from the fruit; (2) two weeks later; (3) just after the fruit is picked; and (4) three weeks later if needed. The lime-sulphur may be diluted about one part to forty of water and iron sulphate may be added at the rate of about one pound to fifty gallons of spray. The iron sulphate eliminates the possibility of burning the foliage and greatly increases the adhesiveness of the spray, both on the operator and the foliage. Sapsucker dust has also been used

with some success. It is put on in combination with lead arsenate, at the rate of ninety parts of the dust to ten parts of the arsenate.

This yellowing of the foliage may also be caused by other things, among which may be mentioned improper spraying, insufficient moisture supply, disease or injury to the roots or to the collar of the tree. It is impossible at this distance, however, to say from the data at hand just which grower may be able to select the one that fits his case from the names and the description of symptoms given above.—J. P. Stewart.

SOD VS. TILLED ORCHARDS

It is quoted that a sod mulch orchard has many advantages over a tillage orchard; but I've never seen the following point touched upon. Is the injury by codling moth or by the curculio greater in a sod mulch than in a tilled orchard, since insects can readily harbor undisturbed in the sod mulch. I would be glad to see this question discussed in your valuable paper.—F. S., Bucks Co., Pa.

This is a question that frequently arises, but on which there is little, if any, exact data. Theoretically, it should be harder to control the curculio, and possibly also the codling moth, in an untilled orchard than in one that is tilled. In practice, however, we have never been able to see any measurable difference in the insect injury on tilled and untilled blocks of the same orchard, on which the spraying had been the same.

It is also worthy of note in this connection that some of the most famous orchards in the country for high-class fruit, such as the Marshall orchard in Massachusetts, the Lewis orchard in Pennsylvania, and the Hitchings orchard in New York, are all handled without tillage.

This does not mean, however, that tillage should be avoided in an orchard, as in many cases it may be the best treatment to follow, at least occasionally. At the same time, one should not feel that it is the only way to grow first-class fruit, since we have so many cases which indicate the contrary.

Incidentally the insects are unusually busy this year on all kinds of orchards, and the very limited crop available for their attention is going to make it especially difficult to get perfect fruit in any of them. In Southern Pennsylvania, the curculio has done the most damage that is apparent to date, but the redbug has also done something, and the work of the codling moth is still to become evident. It certainly takes nerve to go ahead spraying with the fruit as scattered as it is, but it will have to be done if any good fruit is to be secured at all.—J. P. Stewart.

FOUR "WHYS" OF CULTIVATION

If you have not learned it already, here are four good reasons why cultivation is one of the essential requisites for success in the garden: (1) It destroys the weeds, thus allowing just so much more plant food for the good crops. (2) It produces a mulch and conserves moisture in the ground which will be needed when dry weather comes on. (3) Cultivation allows the air to get into the soil for the propagation of the friendly bacteria. (4) A cultivated garden looks much better and will produce the maximum crop.

Plants for late cabbage may be set about June 20. Allow the same distances as for early cabbages and keep the crop growing. Store any surplus for winter use by burying in the ground.

Boys' Department

Dear Editor—I am 12 years old and live on a farm of 50 acres. We have 4 horses, 2 cows and 5 pigs. S. R. Snyder asked for information for making a kite that will fly. Here is a description of one that I made and it went up real nice. It is 3 feet long and 2 feet wide. The cross strip should be two-thirds as long as the long strip and should be fastened to the long strip one foot from each end when the kite is 3 feet long. The strips should be made of green apple wood. A piece of fishing cord is stretched around the kite. Then the paper is fastened to the strips and string with glue. The paper should be cut large enough so that it could be seamed over the string. Care should be taken that the tail is not too light or too heavy.—Daniel Stauffer, Lancaster Co., Pa.

Dear Editor—I have been reading the boy's page and I am very much interested in what the other boys have to say. I am sorry we don't have more space.

I am 12 years of age, I go to school which is only a very short distance. I am in the fifth grade. I live on a farm of 240 acres which has two sets of buildings on—one a tenant lives in and the other we live in, and all necessary outbuildings, we own a touring car and have a tractor to do our work. We keep six horses, five milk cows; last winter

Scott Palmer, an Indiana Co. Boy's Column Reader

we fed thirty head of steers. We have 20 hogs. I have one of my own which had four pigs last winter, we also have about 200 chickens and some ducks. I have two brothers and two sisters.

I help my father do much work. I plow, harrow and do most any kind of work with three horses. I like to kill mice and rats for they are very destructive pests. — Gelwicks McNair, Adams Co., Pa.

Dear Editor—I am very much interested in the Pennsylvania Farmer, especially the boy's page. I hope it will continue. I have seen two letters published from Bucks County and hope this one will be published, too. I am a boy 12 years of age and just graduated from the eighth grade. Next year I expect to attend high school. I live on a farm of 60 acres. We make a specialty of fruit and poultry. Owing to the late and heavy frost, most of our fruit froze this spring, but our chickens are doing fine.

We have one thousand chicks, five hundred hens, two cows, one calf, ten pigs and three horses. As pets I have eight rabbits, thirty-four chicks and three pairs of pigeons. I have a brother and a sister somewhat older than I am, and one brother younger than I, namely, Victor, Pearl and Walter. I think this is enough for my start. Hurrah for Pennsylvania Farmer.—Paul M. Hoffman, Bucks County, Pa.

No one should judge another by mere surface facts. Until the heart is understood the actions cannot be.

The Valley of the Giants

By PETER B. KYNE

Synopsis John Cardigan, a middle-aged man—a giant in frame and mind—was a pioneer settler along the Pacific coast in Humboldt County, California, in 1860. His business was cutting the giant trees into lumber. His young wife died and was buried among the redwoods in "The Valley of the Giants," as he called the spot which he loved and preserved as a shrine to her memory. Bryce, Cardigan's only son, was an ultimate dream of his father—who planned that he should inherit the great lumber business which he had built up. Bryce had a brief love affair with Shirley Sumner, a visitor to the neighborhood, but she was soon forgotten. Cardigan tried to buy a tract of timber adjoining his and refused to be bribed into raising his offer for it. He determined to move his mill to the San Hedrin watershed and start logging operations there. Bryce, after four years of college in the East, and two years of travel abroad returned to Sequoia. He was met at the train by George Sea Otter. Bryce developed an interest in a young woman who got off the train with him and found no one to meet her. He learned that she was Shirley Sumner and she accepted his invitation to ride to Sequoia with him. Their arrival home he found that his father had been nearly blind for two years and that he was in danger of losing his redwoods to his competitor, Colonel Pennington.

Chapter VIII

AS HE stepped into the familiar entrance-hall, Bryce paused, raised his head and sniffed suspiciously, like a bird-dog. Mrs. Tully arms akimbo, watched him pleasantly. "I smell something," he declared, and advanced a step down the hall for another sniff; then, in exact imitation of a foxhound, he gave tongue and started for the kitchen. Mrs. Tully, waddling after, found him "pointing" two hot blackberry pies which had but a few minutes previous been taken from the oven. He was baying lugubriously.

"They're wild blackberries, too," Mrs. Tully announced proudly. "I remembered how fond you used to be of wild-blackberry pie—so I phoned up to the logging-camp and had the woods-boss send a man out to pick them."

"I'm still a pie-hound, Mrs. Tully, and you're still the same dear, thoughtful soul. I'm so glad now that I had sense enough to think of you before I turned my footsteps toward the setting sun." He patted her gray head. "Mrs. T." he declared, "I've brought you a nice big collar of Irish lace—bought it in Belfast, b'gosh. It comes down around your neck and buckles right here with an old ivory cameo. I picked up in Burma and which formerly was the property of a Hindu queen."

Mrs. Tully simpered with pleasure and protested that her boy was too kind. "You haven't changed a single speck," she concluded proudly.

"Has the pie?"
"I should say not."
"How many did you make?"
"Two."
"May I have one all for myself, Mrs. Tully?"

"Indeed you may, my dear."
"Thank you, but I do not want it for myself. Mrs. Tully, will you please wrap one of those wonderful pies in a napkin and the instant George Sea Otter comes in with the car, tell him to take the pie over to Colonel Pennington's house and deliver it to Miss Sumner? There's a girl who doubtless thinks she has tasted pie in her day, and I want to prove to her that she hasn't." He selected a card from his card-case, sat down, and wrote:

Dear Miss Sumner:
Here is a priceless hot wild-blackberry pie, especially manufactured in my honor. It is so good I wanted you to have some. In all your life you have never tasted anything like it.
Sincerely,
BRYCE CARDIGAN.

He handed the card to Mrs. Tully and repaired to his old room to remove the stains of travel before joining his father at dinner.

Some twenty minutes later his un-

usual votive offering was delivered by George Sea Otter to Colonel Pennington's Swedish maid, who promptly brought it in to the Colonel and Shirley Sumner, who were even then at dinner in the Colonel's fine burl-redwood-paneled dining room. Miss Sumner's amazement was so profound that for fully a minute she was mute, contenting herself with scrutinizing alternately the pie and the card that accompanied it. Presently she handed the card to her uncle, who affixed his pince-nez and read the epistle with deliberation.

"Isn't this young Cardigan a truly remarkable young man, Shirley?" he declared. "Why, I have never heard of anything like his astounding action. If he had sent you over an armful of American Beauty roses from his father's old-fashioned garden, I could understand it, but an infernal blackberry pie! Good heavens!"

"I told you he was different," she replied. To the Colonel's amazement she did not appear at all amused.

Colonel Pennington poked a fork thru the delicate brown crust. "I wonder if it is really as good as he says it is, Shirley."

"Of course. If it wasn't, he

incurring the risk of having to marry him."

"I repeat that this is most extraordinary."

"Only because it is an unusual thing for a young man to do, although all, why shouldn't he send me a blackberry pie if he thought a blackberry pie would please me more than an armful of roses? Besides, he may send the roses to-morrow."

"Most extraordinary!" the Colonel reiterated.

"What should one expect from such an extraordinary creature? He's an extraordinary fine-looking young man, with an extraordinary scowl, and an extraordinary crinkly smile that is friendly and generous and free from masculine guile. Why, I think he's just the kind of man who would send a girl a blackberry pie."

The Colonel noticed a calm little smile fringing her generous mouth. He wished he could tell, by intuition, what she was thinking about—and what effect a hot wild-blackberry pie was ultimately to have upon the value of his minority holding in the Laguna Grande Lumber Company.

Chapter IX

Not until dinner was finished and father and son had repaired to the library for their coffee and cigars did Bryce Cardigan advert to the subject of his father's business affairs.

"Well, John Cardigan," he declared comfortably, "today is Friday, I'll

Agriculture

In former years, when men essayed Good Mother Earth to tickle. It was not counted as a "trade." To wield the scythe and sickle. To steer a plow and drive a nag. And, with the feet loam-weighted. Plod back and forth behind a "drag."

As "Hopping clouds," was rated. He counted brawn ahead of brain. The doughty son of Labor Who daily toiled thru sun and rain.

As likewise did his neighbor, He blindly fought the worms and flies. Which yearly were alarming. And, tho he took the County prize, His toil was classed as "farming."

But, in these days of modern tools And more progressive seeding, We learn our precepts in the schools.

And thru constructive reading. A good farm paper fills the need. And is a potent factor In raising crops from fertile seed. As much so as the tractor.

Where formerly we cast aside All scientific data. It now affords us joy and pride To raise a smooth potato. So, raising livestock, corn and peas, In spite of pest and vulture, Is a "profession," if you please, And classed as "agriculture."

—Colorado Ag. College News Notes

wouldn't have sent it."

"How do you know?"

"By intuition," she replied. And she cut into the pie and helped the Colonel to a quadrant of it.

"That was a genuine hayseed faux-pas," announced the Colonel a few moments later as Shirley was pouring coffee from a samovar-shaped percolator in the library. "The idea of anybody who has enjoyed the advantages that fellow has, sending a hot blackberry pie to a girl he has just met!"

"Yes, the idea!" she echoed. "I find it rather charming."

"You mean amusing."

"I said 'charming.' Bryce Cardigan is a man with the heart and soul of a boy, and I think it is mighty sweet of him to share his pie with me. If he had sent roses, I should have suspected him of trying to 'rush' me, but the fact that he sent a blackberry pie proves that he's just a natural, simple, sane, original citizen—just the kind of person a girl can have for a dear friend without

spend Saturday and Sunday in sinful sloth and the renewal of old acquaintance, and on Monday I'll sit in at your desk and give you a long-deferred vacation. How about that program, pard?"

"Our affairs are in such shape that they could not possibly be hurt or bettered, no matter who takes charge of them now," Cardigan replied ditherly. "We're about thru. I waited too long and trusted too far; and now—well, in a year we'll be out of business."

"Suppose you start at the beginning and tell me everything right to the end. George Sea Otter informed me that you've been having trouble with this Johnny-come-lately, Colonel Pennington. Is he the man who has us where the hair is short?"

The old man nodded.

"The Squaw Creek timber deal, eh?" Bryce suggested.

Again the old man nodded. "You wrote me all about that," Bryce continued. "You had him blocked whichever way he turned—so effectively blocked, in fact, that the only

pleasure he has derived from his investment since is the knowledge that he owns two thousand acres of timber with the exclusive right to pay taxes on it, walk in it, look at it and admire it—in fact, do everything except log it, mill it, and realize on his investment. It must make him feel like a bally jackass."

"On the other hand," his father reminded him, "no matter what the Colonel's feeling on that score may be, misery loves company. And not until I had pulled out of the Squaw Creek country and started logging in the San Hedrin watershed, did I realize that I had been considerable of a jackass myself."

"Yes," Bryce admitted, "there can be no doubt but that you cut off your nose to spite your face."

There was silence between them for several minutes. Bryce's thoughts harked back to that first season in logging in the San Hedrin, when the cloudburst had caught the river filled with Cardigan logs and whirled them down to the bay, to crush thru the log-boom at tidewater and continue out to the open sea. In his mind's eye he could still see the red ink figures on the profit-and-loss statement. Sinclair, his father's manager, had presented at the end of that year.

The old man appeared to divine the trend of his son's thoughts. "Yes, Bryce, that was a disastrous year," he declared. "The mere loss of the logs was a severe blow, but in addition I had to pay out quite a little money to settle with my customers. I was loaded up with low-priced orders that year, although I didn't expect to make any money. The orders were merely taken to keep the men employed. You understand, Bryce! I had a good crew, the finest in the country; and if I had shut down, my men would have scattered and—well, you know how hard it is to get that kind of a crew together again. Besides, I had never failed my boys before, and I couldn't bear the thought of failing them then. Half the mills in the country were shut down at the time, and there was a lot of distress among the unemployed. I couldn't do it, Bryce."

Bryce nodded. "And when you lost the logs, you couldn't fill those low-priced orders. Then the market commenced to jump and advanced three dollars in three months—"

"Exactly, my son. And my customers began to crowd me to fill those old orders. Praise be, my regular customers knew I wasn't the kind of lumberman who tries to crawl out of filling low-priced orders after the market has gone up. Nevertheless I couldn't expect them to suffer with me; my failure to perform my contracts, while unavoidable, nevertheless would have caused them a severe loss, and when they were forced to buy elsewhere, I paid them the difference between the price they paid my competitors and the price at which they originally placed their orders, with me. And the delay in delivery caused them further loss."

"How much?"
"Nearly a hundred thousand—to settle for losses to my local customers alone. Among my order I had three million feet of clear lumber for shipment to the United Kingdom, and these foreign customers, thinking I was trying to crawlfish on my contracts, sued me and got judgment for actual and exemplary damages for my failure to perform, while the demurrage on the ships they sent to freight the lumber sent me hustling to the bank to borrow money."

He smoked meditatively for a min-

ute. "I've always been land-poor," he explained apologetically. "Never kept much of a reserve working-capital for emergencies, you know. Whenever I had idle money, I put it into timber in the San Hedrin watershed, because I realized that some day the railroad would build in from the south, tap that lumber, and double its value. I've not as yet found reason to doubt the wisdom of my course; but"—he sighed—"the railroad is a long time coming!"

John Cardigan here spoke of a most important factor in the situation. The crying need of the country was a feeder to some transcontinental railroad. By reason of natural barriers, Humboldt County was not easily accessible to the outside world except from the sea, and even this avenue of ingress and egress would be closed for days at a stretch when the harbor bar was on a rampage. With the exception of a strip of level, fertile land, perhaps five miles wide and thirty miles long and contiguous to the seacoast, the heavily timbered mountains to the north, east, and south rendered the building of a railroad that would connect Humboldt County with the outside world a profoundly difficult and expensive task. The Northwestern Pacific, indeed, had been slowly building from San Francisco Bay up thru Marin and Sonoma counties to Willits in Mendocino County. But there it had stuck to await that indefinite day when its finances and the courage of its board of directors should prove equal to the colossal task of continuing the road two hundred miles thru the mountains to Sequoia on Humboldt Bay. For twenty years the Humboldt pioneers had lived in hope of this; but eventually they had died in despair or were in process of doing so.

"Don't worry, Dad. It will come," Bryce assured his father. "It's bound to."

"Yes, but not in my day. And when it comes, a stranger may own your San Hedrin timber and reap the reward of my lifetime of labor."

Again a silence fell between them, broken presently by the old man. "That was a mistake—logging in the San Hedrin," he observed. "I had my lesson that first year, but I didn't heed it. If I had abandoned my camps there, pocketed my pride, paid Colonel Pennington two dollars for his Squaw Creek timber, and rebuilt my old logging-road, I would have been safe today. But I was stubborn; I'd played the game so long, you know—I didn't want to let that man Pennington outgame me. So I tackled the San Hedrin again. We put thirty million feet of logs into the river that year, and when the freshest came, McTavish managed to make a fairly successful drive. But he was all winter on the job, and when spring came and the men went into the woods again, they had to leave nearly a million feet of heavy butt logs permanently stranded in the slack water along the banks, while perhaps another million feet of lighter logs had been lifted out of the channel by the overflow and left high and dry when the water receded. There they were, Bryce, scattered up and down the river, far from the cables and logging-donkeys, the only power we could use to get those monsters back into the river again, and I was forced to decide whether they should be abandoned or split during the summer into railroad ties, posts, pickets, and shakes—commodities for which there was very little call at the time and in which, even when sold, there could be no profit after deducting the cost of the twenty-mile wagon

haul to Sequoia, and the water freight from Sequoia to market. So I abandoned them."

"I remember that phase of it, partner."

"To log it the third year only meant that more of those heavy logs would jam and spell more loss. Besides, there was always danger of another cloudburst which would put me out of business completely, and I couldn't afford the risk."

"That was the time you should have offered Colonel Pennington a handsome profit on his Squaw Creek timber, pal."

"If my hindsight was as good as my foresight, and I had my eyesight, I wouldn't be in this dilemma at all," the old man retorted briskly. "It's hard to teach an old dog new tricks, and besides, I was obsessed with the need of protecting your heritage from attack in any direction."

John Cardigan straightened up in his chair and laid the tip of his right index finger in the center of the palm of his left hand. "Here was the situation, Bryce: The center of my palm represents Sequoia; the end of my fingers represents the San Hedrin timber twenty miles south. Now, if the railroad built in from Grant's Pass, Oregon, on the north from the base of my hand, the terminus of the line would be Sequoia, twenty miles from your timber in the San Hedrin watershed!"

Bryce nodded. "In which event," he replied, "we would be in much the same position with our San Hedrin timber as Colonel Pennington is with his Squaw Creek timber. We would have the comforting knowledge that we owned it and paid taxes on it but couldn't do a darned thing with it!"

"Right you are! The thing to do, then, as I viewed the situation, Bryce, was to acquire a body of timber north of Sequoia and be prepared for either eventuality. And this I did."

Silence again descended upon them; and Bryce, gazing into the open fireplace, recalled an event in that period of his father's activities. Old Bill Henderson had come up to their house to dinner one night, and quite suddenly, in the midst of his soup, the old fox had glared across at his host and bellowed:

"John, I hear you've bought six thousand acres up in Township Nine."

John Cardigan had merely nodded, and Henderson had continued: "Going to log it or hold it for investment?"

"It was a good buy," Cardigan had replied enigmatically; "so I thought I'd better take it at the price. I suppose Bryce will log it some day."

"Then I wish Bryce wasn't such a boy, John. See here, now, neighbor, I'll 'fess up. I took that money Pennington gave me for my Squaw Creek timber and put it back into redwood in Township Nine, slambang up against your holdings there, John. I'd build a mill on tidewater if you'd sell me a share, and I'd log my timber if—"

"I'll sell you a mill-site, Bill, and I won't stab you to the heart, either. Consider that settled."

"That's bully, John; but still, you only dispose of part of my troubles. There's twelve miles of logging-road to build to get my logs to the mill, and I haven't enough ready money to make the grade. Better throw it with me, John, and we'll build the road and operate it four our joint interest."

(Continued Next Week.)

Self-sacrifices lies at the door of the cost of the twenty-mile wagon

all great usefulness.

mileage maker

15% TO 20% HEAVIER

GOING is easier, steadier, surer for the light car equipped all around with Traveler Tires. Travelers are 15% to 20% heavier, stronger, sturdier, better looking, smoother riding.

Every Traveler is structurally the same—a heavier tire for its size, with 50% thicker tread, extra depth of finest cushion stock, and heavily rubberized double breaker strip; overplus protection from jolts, jars and wearing vibration.

And every Traveler Tire—cord or fabric—is built with that exclusive Traveler flat inside, the greatest improvement in tire design in years. This flat inside means that Traveler Tires run normally shaped while carrying the load, without contortion, unequal wall strain, or excess internal friction.

Traveler Tires help light cars to hold the road better. They're so generous with surplus mileage you can generally forget about that guarantee. Once you know them, you'll always "travel on Traveler Tires."

MICHIGAN LIMESTONE MEANS

**MORE WHEAT
MORE CLOVER
MORE FERTILITY**

**OVER 99%
PURE CARBONATE**

EVERY acre of your land to which you apply one to two tons of Michigan Pulverized Limestone will for the next five years produce more wheat, more clover hay, more timothy, more corn or potatoes, more oats or barley.

Each year you should more than get back the cost of liming, and at the end of the rotation your limed soil will be in much better condition than if it had gone through the rotation without Michigan Limestone.

Farmers who are going over their lands the second time with Michigan Limestone are getting even better results from the second and lighter application than from the first.

GET
MORE
CROPS

**LOWERS YOUR
PRODUCTION COST**

AT
LESS
COST

THE expense per crop is small, as Michigan Limestone is applied but once in a crop rotation. Land lacking limestone will produce but a partial crop. Only on a well-limed soil can you get maximum crop growth.

Michigan Pulverized Limestone in your soil adds to the value of every ton of manure and commercial fertilizer by making them more readily available.

Michigan Pulverized Limestone insures clover, and clover supplies the lime your animals need. Two tons of good clover hay is equivalent in feeding value to one ton of grain feed. Furthermore, each acre of limed clover puts about two tons of plant roots—Nitrogenous Fertilizer Material—into your soil for its upbuilding.

The money you put into Michigan Limestone will pay you probably better dividends than any other investment you can make.

Motor Trucks to the Rescue of Growers

How Modern Transportation Methods Helped Bustleton, Pa., Gardeners

By THOS. H. WITTKORN

A MOTOR TRUCK on practically every farm and few farm horses with shoes on, may seem rather idealistic but it is the actual condition existing around Bustleton, Pennsylvania, the big market gardening section of Philadelphia. "We'd quit the business if we had to go back to horses to do the hauling," is the universal answer of the farmers in that section as to how trucks compare with horses. A trucker's wagon on the road is indeed a rare sight because even the small growers who cannot afford trucks of their own, ship by their neighbor's or a custom truck.

The farming methods around Bustleton have been completely changed since the coming of motor trucks. It was only a few years back when this district was strictly a grain section. It is ten to fifteen miles from the wholesale produce markets and there was plenty of room then for the city truckers in the "neck" and Richmond sections of Philadelphia which were only a couple of miles from the markets. Building operations, however, gradually crowded the truckers out of these places so today a large part of the city's truck crops are grown farther away from its center than they could be if horses had to be depended on to do the marketing.

Not only have motor trucks been the salvation of the truckers crowded out of the city but they have enabled lots of good food from farms still beyond the recognized trucking sections to get to market. Farmers at these farthest outposts are now able to heed the call of a big city for something fresh to eat and while they start with a few easily grown crops they will eventually become real truckers as the city grows. Even now most of the land around Bustleton is valued at \$1000 an acre and the men do not hesitate to sell and move farther out when the opportunity presents itself since they have trucks to eliminate distance for them.

Some interesting figures concerning these conditions in Philadelphia County were recently published by L. H. Wible, the statistician of the Pennsylvania Department of Agriculture. He found that on January 1, 1921, there were 355 automobiles and 282 motor trucks on the farms of that county. It is, of course, nothing to brag about when you think of the cars and trucks in some of the strictly agricultural counties, but it is full of meaning when you consider the limited farming area and the almost equal number of pleasure and business machines. Indeed it is the only county in the state where the figures show any such relation. In Lancaster County, for instance, noted as a banner farming section, there are 20 automobiles for every motor truck—Mr. Wible will tell you there are 7,914 cars and 385 trucks. In York County the relation is 10 to 1 and in Chester County 7 to 1 while the average for the whole state is nearly 8 to 1. Remember this does not count the machines in the cities but on the 202,298 farms,

which we have according to the 1920 census. It was these figures which recently caused me to spend two days visiting a number of farmers around Bustleton and what I found out is recorded in this little tale. I was able to hear of only four farms of any importance which did not have a motor truck. Practically every make and size I ever heard of were represented but those rated two and two and a half tons capacity seemed to meet all the requirements best.

Truck Shortens Trip to Market

The fine improved roads of Philadelphia County leading right from the farms to the city markets, have undoubtedly helped the change from horse to gas vehicles but there were other vital factors also. In order to get the most work out of every man on the farm, especially of late years

to waste taking them to the shop," he added, and he ought to know because he is one of the successful men in the Bustleton district. His complete overhead sprinkler system was installed when other folks around him were buying automobiles with their surplus cash. Now he has both and many other modern improvements which make life worth living on the farm and keep the boys and girls at home. His two-ton truck was purchased in 1917 and is still giving excellent service. It is nothing unusual for it to haul 150 five-eighth baskets full of produce twelve miles to market and be back in anywhere from two to four hours time. It takes about four gallons of gasoline to make the round trip and the driver returns in fit shape to do a good day's work on the farm.

It is surprising how hard the hoofs of the farm horses get when they are left without shoes for a long time. The horses are able this way to do all the ordinary work on the farms. How general the practice is may be grasped from the absence of a horseshoer in the village whereas only a short time ago there were three shops and they were busy nearly all the time.

Handle Large Loads

Corwin Starkey is another farmer who is enthusiastic about the good service he has had from his truck. In 1915 he bought one rated to carry 4500 pounds and although he told me his usual load is 5000 and often 5500 pounds he is still using the same rear tires which came on the machine. It has carried many loads from his hundred acre farm during these years but has been in a service station only for new brake bands and a leaky radiator. Mr. Starkey is careful, however, where and how he drives and keeps the little things attended to before they become serious. One of the greatest advantages he finds in hauling by truck is the quickness with which he can market his sugar corn. This is one crop which soon loses its "quality" when a lot of it is piled together and given a long trip to market. Every grower knows how quickly it will heat and lose all its sweetness. With the truck Mr. Starkey can get his corn to the commission man two hours after it is picked, whereas it used to take him from five to eight hours under the old system. His salad and spinach, two other perishable crops, also reach market in better shape and bring better prices accordingly.

Another man I visited who could not say enough for his truck was Howard N. Dudley. He has run his more than 15,000 miles and never had the crankcase down. He does not spare it either when it comes to putting on big loads but is careful how he or his son drives it. He puts on four tons of manure when he hauls from the car to his farm although the truck is rated to carry only two and a half tons, but then he has an ideal road to travel over.

All the men I visited had the right idea about

A Truck Provides Rapid and Easy Transportation

care in driving their trucks but possibly did not express it as concisely as one of the big tire manufacturers who advertises "Motor trucks are seldom worn out, they are usually pounded to pieces." But even with the best of tires a truck will have a short life if it is loaded to the limit and then snatched, jerked and generally ill-treated irrespective of the condition of the road. When the owner drives his truck he is careful with it and you can tell from the cases cited that it is nothing unusual to find growers who have used their trucks from three to six years and are still getting satisfactory service.

The ability of motor trucks to make more than one trip a day, irrespective of ordinary weather conditions, and always be loaded to capacity, helps wonderfully when the rush season comes. Being able to bring back to the farm without fatigue, just as big a load as they take away settles the big problem of hauling stable manure to the soil. Yes, truckers with motor trucks are always assured of a plentiful supply of fertility. Those who must haul manure from the railroad cars are at the mercy of railroad uncertainties and unscrupulous dealers but the men with trucks go right to the city stables and haul the manure direct to their fields.

Various arrangements are made with stable owners for the manure and a common way is to load all that can be put on a two-ton truck and pay seventy-five cents for it. This may seem like stealing it but in the city it costs money to get rid of it and when it brings in something the owner is pleased. Some farmers make a yearly contract with stablemen for all the manure they will have, while still others buy from a city dealer who makes contracts with several stable owners but does not handle the manure, he merely sells the right to haul it away.

The people in the village of Bustleton are especially pleased with this plan of hauling direct from the city because it was only a few years ago that they were up in arms against the farmers regarding manure. That was when there used to be from 25 to 30 carloads at one time on the railroad siding in the center of the town and the people objected because of the odors and the flies. Then there was an almost endless procession of farm wagons hauling it away and it is little wonder that the people threatened to have the Board of Health do something to have conditions changed.

The photograph shows a typical load of manure hauled direct from a city stable to the field. George Biddle, the trucker in this case, makes three trips a week for manure and brings from three to four tons in each load depending on how much is at the stable. He makes the trip with the motor truck and two men in three hours whereas it formerly required four horses and six hours time. Mr. Biddle not only saves this time of men and horses but gets a better grade of manure. He is especially pleased with this work of his truck and could not speak too highly of it. He told me that when he used to haul from the railroad he would get, in nearly every carload, from a half to a ton of old bricks, cinders or soft coal besides old wire, broken glass and oil sweepings from the streets. He not only had to pay for all this foreign material but it gave him more work, littered up his farm and increased the possibility of accidents to the men and animals.

On none of the farms which I visited did I notice that a garage had been built especially to keep the truck. Every farm, of course, had a well appointed packing house and the common plan was to give the truck garage space in connection with it. Concrete floors were much in evidence and provision had been made for heating the packing houses in cold weather.

Convenient Packing House Saves Labor

The garage arrangement made by one grower was especially noteworthy and could be copied easily by other truckers or in fact by anyone having a lot of loading to do. In this case the building was possibly 40 feet square, and it served as garage, packing house, implement shed and storage room for empty baskets, boxes, etc. Half of it, that is a space approximately 40 by 20 feet, was for the packing house with a stove, wash-tubs, tables, etc., while the other half was divided in half again. The front half of this side was used for storing farm implements of various kinds while the truck was kept in the rear. As there was no partition between the garage and the packing house the tall board of the truck backed right up to the side of the packing room. In order then, to make it easy loading, the floor of the garage had been dug on a slant to the rear so that the floor of the truck was on a level with the floor of the packing house. It required no

er so that the trucks were generally given good care. and if he loses his job he can get another, at least he could until recently. It is no wonder then that it costs a lot of money to keep the average city truck going, but it does not of necessity follow that the costs per mile of service are the same for the farm truck. Even if the owner is not going to drive it himself the average farm hired man is used to handling machinery, caring for his team, etc., and when he changes to a truck he has a better appreciation of the value of a little good treatment than a man who has always had little interest except to get his pay envelope when Saturday night comes. When a farmer drives his own truck, conditions are just about ideal for long service at a low cost. Any garage man will tell you it is the little things neglected which make the big bills, so when a man all his life has been thinking about the comfort of his horses and the care of his wagon it just naturally follows he will be considerate of his motor truck and get excellent results from it. The men around Bustleton have proved this for themselves but if you want more proof there surely must be examples near at home which you can visit.

George Biddle and Sons of Bustleton Haul Manure From City Stables Direct to Field. This is a Four Ton Load

lifting then to load boxes, barrels, etc., but they could be easily put in with the small two-wheeled hand trucks, such as are commonly used for handling freight. The floor of the garage was concrete and they told me that the truck had no difficulty in starting the load up the incline.

The city commission men are pleased with the new marketing by motor truck methods as the goods get to them earlier, in better shape and they can arrange their stock before the buyers start coming around midnight. As one farmer pointed out to me the commission man can now move his lettuce crop, or salad as it is commonly called, all the way to Atlantic City quicker than he used to be able to get it from the farm to the commission man. With the aid of the telephone, too, the growers are able to take advantage of any favorable market conditions which may arise. Without a motor truck they would not be able to do this as the horse drawn wagons were limited to one trip a day—that is from 24 to 30 miles.

My whole tale seems to prove that it does not do for farmers to be scared away from motor trucks just because some city business men, who have to depend solely on hired help, may have had some trouble with them. The average city truck driver (that is the man hired for that purpose) seems to care little about operating costs and maintenance charges of the truck he is driving. He knows the owner has to pay the bills

CHANGED TYPES OF FARMING

The character of the farming industry, in Central New Jersey has completely changed during the past thirty-five years. Especially is this the case in Monmouth County. Where our farmers formerly practiced diversified farming, livestock raising and grain growing, they have become gardeners, with the Irish potato their specialty. Fences have disappeared and with them have gone the sheep, the colts, and the cow. Even the small door yard apple orchard is following in the wake of the fences. Farmers keep one or two cows, but many have neither cow nor pig.

Thirty-five years ago the sandy loam farm was out of favor. It is no longer grass land; hence would not mow or pasture heavily. We were looking then to buy a heavier soil, one more adapted to the growing of grass and wheat. Underdrains were small, objections. Labor was plentiful and cheap. Even should drains require re-laying, the expense counted little.

The same law applies when one considers that it takes a team and extra man to work every 100 acres of the heavy type of soil. It, too, requires a more elaborate system of underdrains to raise potatoes than for grain or grass. After all, the potato crop is almost invariably better on the light land.

All this was recently brought more forcibly to my attention when a farm that had always been called one of the best in the township, was thrown on the market. It contained 190 acres. One hundred and twenty is a fine sassafras loam, the balance a heavy clay, needing more underdrains, but capable of raising good crops of hay and grain. The owner of an adjoining farm, a man who had made his money from the potato crop, offered \$24,000 for the 120 acres. The balance he did not want at any price, claiming the ever-increasing taxes, the high cost of labor and underdraining materials, would make it a non-paying proposition.

One of Monmouth's finest farms, containing 160 acres was sold a little more than a year ago to a progressive young farmer. The writer recently visited the place. Cross fences have been removed and the whole farm thrown in one field. This is one instance among many. When one goes along our roads and sees a farm cut by fences into many fields, he knows it belongs to some elderly person. It is a relic of a past generation. Time makes changes necessary in everything—

Thos. A. Smith, Monmouth Co., N. J.

A Good Machine Makes Mowing a Pleasure

The Cost Factor in Potato Production

Larger Yields Usually Mean Lower Production Cost Per Bushel

By Dr. J. G. LIPMAN
Director New Jersey Experiment Station

IN ROUND FIGURES, the world's potato acreage is 40 millions of acres, and that of the United States four million acres. It might be expected that with 10 per cent of the world's acreage we should be producing the same proportion of the total crop, but this is not the case. In the period 1908 to 1915 the world's production fell under the 5 billion bushel mark but once, and it came within hailing distance of the 6 billion bushel mark twice, namely, with 5,872,953,000 bushels in 1912 and 5,802,910,000 bushels in 1913. Our own production was 420 millions of bushels in 1912 and 331 millions of bushels in 1913. In 1917 we had a large acreage, about 4,400,000 acres, and grew a record crop, about 442,000,000 bushels, but the average acre yield in that favorable season was a little less than 101 bushels. On about 4,000,000 acres in 1919 we produced only about 358,000,000 bushels, or but little more than \$9 bushels per acre. We had another favorable season in 1920 when we grew about 430,000,000 bushels, but still fell short of the average acre yield in the European countries. The figures just given are of considerable interest, since they naturally lead to questions that concern not only acre yields but also the factors that determine acre yields and the influence of these on the cost of production.

Quite recently the Office of Farm Management and Farm Economics of the United States Department of Agriculture issued a preliminary report on labor and material requirements in the production of potatoes. This report includes 461 records collected in 1920 in nine important potato growing areas in Minnesota, Wisconsin, Michigan, New York and Maine. Table I summarizes this report and represents the cost of each item as a percentage of the total cost of production in two counties in Michigan, two in New York and one in Maine.

It will be observed that by far the most important item of expense is labor, and that man labor represents a larger outlay than horse labor. The cost of the two represents nearly one-half of the entire cost of growing the crop. However, this is not true of Aroostook County, Maine, where the outlay for fertilizer is so large as to represent 35.8 per cent of the total cost of growing the crop. The growers in Wisconsin and Michigan use fairly large quantities of manure and scarcely any fertilizer. In Maine, on the other hand, relatively little is spent on manure, for the organic matter is furnished largely by the sods and the plant food by the fertilizer.

The cost of labor and materials was higher in 1920 than it was in 1919. On the basis of the information obtained in 1919 and using the higher values of 1920 the costs shown in Table II are given, by way of example, for Waupaca County, Wisconsin.

The figures given gain in interest when compared with similar data obtained by Allen G. Waller, of the New Jersey Experiment Station, in Monmouth County, New Jersey. Comparisons are made in Table III of the costs for 1919 and 1921. They include all of the important items of labor and materials, as well as the less important items.

The principal changes in cost are the following: Seed is about 45 per cent cheaper than in 1920 and 20 per cent cheaper than in 1919. Fertilizer cost, on the average, about one-sixth less than in 1919 and 1920, altho some of the growers saved much more than this by buying the in-

gredients and doing their own mixing. The decrease in the cost of spray materials was about 25 per cent, of man labor about 33 per cent, and of horse labor about 15 per cent. The total decrease is therefore estimated at 14 per cent on the basis of the 1919 figures and at 23 per cent

200 bushels per acre. On the basis of averages the growers in this county, one of the best potato regions in the United States, cannot expect to produce potatoes for less than 65-70 cents per bushel. It is also evident that the best growers, those who can consistently produce 300 bushels or more per acre, are able to show much lower costs per bushel. Hence, the factors that make for higher yields, such as the intelligent and liberal use of fertilizers, green manures, insecticides and fungicides, good seed, careful tillage, etc., should be studied just as carefully as the more efficient use of labor and materials in order to reduce production costs.

PENNSYLVANIA 44 WHEAT

The Pennsylvania Agricultural Experiment Station is multiplying and distributing a promising new variety of wheat. It originated with one of a large number of heads selected from a field of Fulcaster in 1909. In 1913 enough seed was grown for a one-sixtieth acre plot, and since 1913 it has been grown in a one-thirtieth acre plot each year in a variety test and also in increase plots. For some years it has been sold to farmers for trial, at first in peck lots and then in two-bushel or larger lots. This year there is being grown on the Experiment Station farms and by farmers of the state approximately 1000 acres, most of which is almost free from mixture. Prior to 1920 it was known by its selection number 44-09, but it is now named Pennsylvania 44.

This wheat belongs to the Fulcaster group which includes besides Fulcaster, Dietz Longberry, and Miracle (also known as Marvelous and Bushel Wheat). Like these it is bearded, has white chaff, and purple straw, and a rather long, red, medium hard berry. It differs from Fulcaster in being two or three inches taller and about two days later. It is also stiffer in the straw.

Below are given the average yields of Pennsylvania 44 and the seven commercial varieties leading in yield at the Pennsylvania Experiment Station for the seven years 1914-20.

Year	Pennsylvania 44	Dawson's Golden Chaff	Harvest King	China	Currell's Prolific	Beechwood Hybrid	Red Wave
1914	35.3 bu.	31.8 bu.	31.4 bu.	30.6 bu.	30.3 bu.	30.2 bu.	29.9 bu.

In 1918-19 there were eight reliable tests conducted by farmers in which Pennsylvania 44 was compared with other varieties, each one a one-acre plot; and in 1919-20 there were twelve such trials. These yields secured are given below.

Average yields per acre secured in farmer's tests:

Year	1919	1920
Pennsylvania 44	28.7 bu.	27.0 bu.
Other varieties	23.9 bu.	20.8 bu.

Difference 4.8 bu. 6.2 bu. It is very important to determine the milling and baking qualities of any new variety of wheat. This new wheat has been milled and tested by Prof. B. W. Dedrick, in charge of milling engineering at the Pennsylvania State College, and his students in comparison with other varieties. The baking tests indicate that in bread making qualities Pennsylvania 44 is practically like Fulcaster which is the standard milling wheat for Pennsylvania.

They are never alone who are accompanied by noble thoughts.—Sir Philip Sidney.

TABLE I
Distribution of Operating Expenses and of Total Cost in Potato Production, 1919 Values. (Percentage basis).

	Michigan	Grand	New York	Maine	Aroostook
	Co.	Co.	Co.	Co.	Co.

Land rental	19.18	19.18
Insurance	.61	.61
Interest	2.74	2.36
Total cost per acre	\$185.90	\$159.93

on the basis of the 1920 figures. Now, assuming a yield of 200 bushels per acre, the cost per bushel would be 80 cents. With a yield of 250 bushels per acre the cost would be 64 cents; and with a yield of 300 bushels per acre it would be 53 cents per bushel. There are many growers in Monmouth County who obtain 300 bushel yields nearly year after year. The average is, however, about 200 bushels per acre, which means that a large number of growers produce less than

Wounds Cuts Ringworm Scab

Live stock men fear wounds or cuts on an animal. They know that infection usually follows and death often results. B-K is a concentrated, pure sodium hypochlorite such as is used and endorsed by leading veterinarians, physicians and breeders. It kills the infection germs; cleanses, soothes and heals the tissues.

is not a poison, acid or coal tar product. Clear and clean as water. It kills the infection germs without pain or discomfort to the animal or burning of tissues.

Proof That Proves

A B-K user in Oso, Washington, says regarding Ringworm:

"We bought a gallon of B-K and took a cloud of pussy suck and went after it with B-K. In three weeks there was not a sign of it left and there has not been a case since. Forget that iodine stuff, it's as far behind the times as wintering cattle on out straw."

Keep B-K constantly at hand in the stable, milking-house and kitchen. Wherever germs lurk it does its work. Money back if you are not satisfied.

Philadelphia Farmers & Dairymen's Supply Co., 1918 Market St., Phila., Pa.

GLOBE SILOS

Have a Full Silo

Silos with ordinary roofs can only be filled with blower cutters within 3 or 4 feet of the top. When silage silos, there is a loss of 5 or 6 feet of silo capacity—quite sixth to one quarter of the total space.

Globe Silos with the famous Globe extension roof, assure a full silo crop. The nearly straight side walls of this extension roof, permit a full level at the top avoiding unnecessary spoilage. Globe silos are built from top to bottom, other silos are built from the bottom up, and are liable to be damaged by the silage.

Write for a free literature and plan for your crop today.

Illustrated plan showing an extension roof for easy silage placement.

HORTICULTURE

A Fine Young Orchard

By J. P. STEWART

ABOUT eight or nine years ago, the writer was called upon to assist a young Pennsylvanian in the selection of either an orchard or an orchard site, on which he could satisfy his desire for an outdoor occupation. He had trained himself for the engineering profession but he found that work too confining. His search took him over some four states and thru a lot of good orchard country. He also secured quite a big list of "available."

After going over the entire list, however, and also going to see several of the most promising places, we came to the conclusion that none of the orchards already planted were just what was wanted, and that if he could stand the expense and delay in returns, the best ultimate success would be secured by selecting a first-class site and starting an orchard of his own. This was done—the selection being made in a state immediately south of Pennsylvania. The farm selected was near a thriving, moderate-sized city, on a hard road, with good local elevation, and its soil was of red shale derivation altho it was largely surrounded by limestone soils. It also needed a lot of cleaning up.

The young chap took the place and dug into the job. We heard comparatively little from him for some years, except in the way of occasional requests for suggestions as to varieties and cultural practices. In the last few years, however, we have been noticing some of his fruit on the principal markets, where he has little trouble in topping the market, and no trouble at all in finding plenty of buyers, regardless of the amount of other fruit offered.

We were also pleased to hear from him recently to the effect that in spite of the unprecedented freezes this spring after the blossoms were out, he is again going to have a very nice crop of peaches. The relative resistance to frost of some of his varieties may be of interest. His J. H. Hale peaches are loaded with fruit and will have to be thinned. His Greensboro, Carman, Ray, and Georgia Belle, all have nice crops; Elberta and Fox fair crops; and Iron Mountain, Smoek and Salway very light. The Hale has always done well on his place, and has sold exceptionally well.

His apples in the same orchard are practically all gone—showing again the general fact that the peach at a given stage of blossom development is much more resistant to freezing than the apple at the same stage. Of his apple varieties, the Winter Banana stood the cold best and at one time looked as if they would carry a nice crop, but they have since largely dropped off. Next to them the Grimes has the most fruit, while the Stayman Winesaps are very scarce. In our own orchard the Staymans stood the freeze considerably better than the York Imperials, which were not nearly so far advanced at the time, and in general the Old Winesap has usually proved to be rather resistant to freezing.

Our orchard friend in the neighboring state also informs us that he

but there will be a few peaches.—E. C. B., Dauphin County, Pa.

I would not be afraid of winter injury from nitrate of soda applied as late as the first of July on peaches or apples. Some of the slower acting materials might result in too late a succulent growth, but I have applied nitrate as late as the last of July on both peaches and apples without any sign of winter injury following, and with good results on the crop of the following year. With the apparently ample growth that the present trees are making, however, it might be well to try the proposed application out on a few typical trees for at least one year before extending it over the entire orchard, as it may not be needed in this particular orchard yet.

August is as good a month as any in which to remove suckers or watersprouts in apples, as they are probably less likely to return after such removal than at any other time.

I doubt whether it would pay one to make any special application for aphids after the second codling spray, at the latest, and I would not consider any spray after the first codling or calyx spray to be of certain value in controlling this insect. They become too well established in the curled leaves to be hit successfully after this calyx spray, so that one usually will have to depend on the natural habits or the natural enemies of these aphids to clear his trees after the time indicated.—J. P. S.

BUTTERFLY THE PEST

The production of cabbage is very largely dependent upon the control of the white butterfly, for it is the larvae of this insect that so very often destroys the entire crop of cabbage. It is the cabbage worm, a medium sized velvety green worm, which is often quite hard to see on the leaves of the young plant.

The control measures are simple and very effective if they are persistently carried out. One very simple means is to go over the plants every few days while they are small and literally kill the worms. The use of poison dust is recommended for the surest means of control of the worm for they are very hard to see. This dust is applied every ten days unless washed off by a rain. When it is necessary to make another application of the dust.

Paris Green Kills Them

An excellent dust for this purpose can be made by mixing one tablespoonful of Paris green with one quart of flour or by mixing two tablespoonfuls of lead arsenate with the same amount of flour. Hydrated lime may be used as a carrier instead of the flour.

Either of the dusts is applied to the cabbage plant when the leaves are dry. For the best success in the control of this pest one should commence on the early broods so that there will not be so many to combat when the cabbage gets into the head, for then the worm burrows into the head and cannot be well reached by the poison.

At one time it was thought that the poison should not be applied after the head was from a half to two thirds grown but it has been found that it can be applied safely clear up to the time of maturity without any danger to the consumer.

Have you named your farm and placed the sign up over the gate? That's one of the best ways of creating a reputation for your produce.

NATIONAL HOLSTEIN MEETING

The second annual sale of the National Holstein Breeders' Association and its annual business meeting recently held in Syracuse, N. Y., were the biggest events of the kind ever held in that state. Both were very liberally attended by both men and women interested in Holsteins from all parts of the United States.

Breeders from the Empire State in particular flocked by the hundreds to the New York State Fair Grounds where the splendid exhibit of cattle was to be seen all the week and a study of their points and of their records was of great inspiration. The spirit of give and take in dairy experience was pronounced. Such an event is of great value in extending and strengthening the industry. All breeders will congratulate Kansas City, Kansas, on securing the meeting for next year, as it will be a great boost to the industry in the weaker sections of the west.

The business meeting set several precedents, one being the heated debate on matters of policy, following the efforts of an unexpectedly power-

ful and the three-day sale had to be crowded into two very full long days of selling.

Transfer fees were reduced from \$1 to 50 cents, and the matter of districting the entire country was left to a committee to consider and report upon. The Cabana-Cole case called for bitter denunciation from association members, who upheld the organization's right to cleanse its own records and keep them clean.

The appeals taken on technicalities were denounced by the counsel for the association. O. U. Kellogg, a breeder of Cortland, N. Y., who said 10 to 12 Supreme Court judges upheld the association in its claim to the right to rule on the case. He would have the fraudulent test removed from the records and have done with the three-year-old controversy that has cast so much discredit on breeders in general. No definite action was taken but perhaps the new officials will be able to clear this thing up in the way honor demands.

The sale was a disappointment to some owners of the highest class animals, which were said to have gone at a sacrifice. Canadian breeders

"Look Right at the Lens," said the Camera Man, and Here You See Betsy of Crystal Spring (right) and Jolly Little Lady (center) Obeying Orders. These are two New Jersey Prize Winners owned by Mr. Forrest F. Dryden, of Stronghold Farm, New Jersey.

ful insurgent element which by means of proxy votes prepared for in advance was able to rule on most of the matters discussed. They demanded methods of economy and more attention to the breed and less to breeders' interests, and in the long run the changes they were able to institute or to pave the way for may prove of value. The conservatives, however, maintained that it was no time to cut off the gas when the machine was going up hill thru sand.

Governor Frank O. Lowden of Illinois, was elected to head the association for the coming year, and George A. Stephenson, of Scranton, Pa., as vice president. F. L. Hough, secretary, and M. H. Gardener, superintendent of advanced registry, were re-elected unanimously, but the directors have reduced their salaries \$1500 a year. The other official salaries may be reduced heavily later by the directors, several of whom are new men and men of policies differing from those in effect in recent months.

President Aitken was re-elected by a big majority of the personal votes cast, but as 2000 proxies had not been counted he declined to accept the office on a technicality and declared Governor Lowden elected. Debate on matters of importance to breeders occupied one whole day more than the meeting was planned

also fared badly, as their express charges and the duty were so high. One man paid \$1400 to get his stock transported to the sale. But in general breeders were satisfied with prices realized. The 171 cattle sold brought \$138,000 or an average price of \$807 each. Animals from New York herds brought the top prices of the sales, the several other notable animals from distant states sold remarkably well.

George Abbott of Cortland, N. Y., sold the top price cow. Arcady Segis Atia, 2nd, 7 years old, to O. M. Montgomery of Spartansburg, S. C., for \$4250. The purchaser recently bought a world's record cow developed by Mr. Abbott for \$7000. Mr. Abbott sold the biggest animal of the sale, a 2750-lb. bull, who is a five-year-old brother of the great bull, Carnation King Sylvia, who sold for \$106,000. W. H. Mace, another Cortland breeder, sold the second highest priced female, Bonalevo Quality Parthena, with a 36-pound record for \$3700 to Wheatland Farm, La Salle. She was the second highest record cow, but sold for \$800 more than the highest record cow. The latter was Pabst Cynthia, having a 33.31 pounds, seven-day butter record at 6 years of age. She was consigned by Bell Farm of Pennsylvania, and went to Jacob Todd of New Jersey. The latter was one of heavy buyers.—Dairy Farmer.

Of Interest to Farm Women and Girls

The Choice of a College
By HILDA RICHMOND

THE choice of a higher school or college should be a matter of interest to the parents years before the children are old enough to enter high school. There is a knowledge to be gained by observation and talking with those who have been to college, that helps the parents to exercise good judgment when their sons and daughters come to college age. "By their fruits ye shall know them," is as true of schools and colleges as of anything else in the world—trees or plants or persons—and the college that is turning out modest, studious, ambitious, industrious young men and women who are steadily climbing the ladder of success is safe, while the one that is frequented by idlers and persons interested only in style or athletics and that turns out uppish, conceited, irreverent graduates and has the reputation of allowing the young folks all the freedom and latitude to be found anywhere, is the college to be shunned.

Shall it be the little college or the

Asha Pauline Williams, Westmoreland Co., Pa.

big college? Both have much to commend them. There is an inspiration in the crowd that the little college never can have, while many thoughtful persons argue that the modest little school offers greater opportunities for the formation of character. Certain it is that where students and professors live together intimately, particularly in a small town, there is a strength of character imparted along with the book knowledge that the big school knows nothing about. In the very nature of things the man with hundreds of pupils in his classes daily can never be to those pupils what the man in the small college can be to his "boys and girls." The young people who were privileged to associate intimately with the great Horace Mann surely went out into the world with higher ideals than those who merely had a bowing acquaintance with the president of the large college. It could not be otherwise. The very contact with great people has a beneficial effect on the growing mind and developing character.

Particularly should a college frequented by very rich men's sons and daughters be avoided. The young folks from the farm may feel sure

that they are perfectly competent to keep their minds on their studies and off the frivolities that others have, but, depend upon it, it is far safer and wiser to select an institution where plain living and high thinking rule rather than clothes and automobiles. Many colleges have barred the luxuries of riding horses, automobiles, fine clothes and dissipation, but there are others which have not seen fit to furnish a wholesome lesson even to rich youths by demanding simplicity.

So, even if you have the money to spare, insist upon it that the young men and women from your household shall go to a school that stands for high character, that can show on its list of graduates men and women who are accomplishing things for humanity as well as those who have made money alone, that welcomes with open arms the young folks who must work their way thru, that has reverent, modest teachers well skilled in the studies they hope to impart to others and, above all, that has American ideals from start to finish. The boys and girls are leaving home for the first time and you want them to have the best surroundings that can be found. The old idea that young people should be thrust into temptation in order to prove their merit has happily passed away forever, and the young people of today who can be saved from discontent and idleness and false ideals during those impressionable years from eighteen to twenty-two by the wise selection of a higher institution are the fortunate beings of earth, and the ones who will serve their day and generation best in the years to come.

It is not too early to begin hunting a good school for the toddler just starting to the first grade, nor too late to investigate for the young man or woman who is to set forth in a few months to complete his education. Find out all the good things about the college and do not be afraid to dig up the weak spots, and then you can rest assured that you have done your part in safeguarding your son and your daughter in the first journey into the great world outside the old home.

ATTRACTIVE CURRANT DISHES

Currant Dessert

Put two tablespoonfuls powdered gelatin into a saucepan, add 1 cup currant juice and 1 cup sugar; dissolve over a gentle fire, add half cup whole currants. Set on the ice until the mixture begins to thicken, then fold in 2 cups whipped cream and the stiffly beaten whites of two eggs. Pour into a wet mold, and set in a cool place to firm. Turn out when set, and decorate with a star of whipped and sweetened cream, sprinkled with a few ripe currants.

Currant Custard

Mash 1 quart of currants until soft, and add 1 cup sugar. Put 1 quart of milk in a double boiler, and when lukewarm add 3 well-beaten eggs, half cup sugar and 2 tablespoon corn starch moistened with a

little cold milk or cream. Stir until it thickens and boils (about eight minutes), remove from the fire, add 1 teaspoon lemon juice and the currants, stir well. Serve cold.

Good Currant Pie

Line a pie tin with pastry, fill with stewed currants, sweetened well and flavored with a little nutmeg. Cover with puff paste and bake. Sprinkle with powdered sugar when serving.

Currant Ice Cream

Four cupfuls of thin cream, 1 cup sugar, 1 teaspoon lemon juice, a pinch of salt and 2 cups currants. Mix the ingredients, and freeze without cooking.

Boiled Currant Pudding

Line a buttered baking dish with rich biscuit dough rolled out one-half inch thick. Fill with red and white currants sprinkled well with sugar, and cover with a top crust. Pinch the edges of the crusts well together, tie over it a floured pudding cloth, and boil three hours in water, which must not cease boiling from the moment the pudding is put in until done. Serve with cream or a sweet sauce.

The Sauce—To make the sauce, beat the yolk of one egg until thick, add gradually half cup sifted gran-

Elizabeth Boyer, Schuylkill Co., Pa.

ulated sugar, beat thoroughly, then add 4 drops of orange flavor, and serve.

Currant Muffins

To two cups sifted flour, half cup sugar and a pinch of salt, add gradually three-fourths cup of sweet milk and two tablespoons melted butter. Then put in the yolks of two eggs and beat the mixture well. Now add two teaspoons baking-powder and the well-beaten whites of the eggs. Wash and dry 1 cup of firm currants, sprinkle lightly with flour, and add to the muffin batter.—Helen Lyman, Mass.

CANNING RHUBARB

To Can Cooked Rhubarb

It is not necessary to cook the rhubarb very much because the strong acid content will preserve it. Cook it only enough to reduce the bulk so that a lot can be put into each can. Sweeten it or not, as you prefer. You will find that if the sugar is cooked into the rhubarb before canning it will require a little less sugar than when you put it in after the cans are opened, that is, unless you heat it in before serving. With the sugar cooked in before canning, the rhubarb is ready to serve as cold sauce at once. However, you may like hot rhubarb sauce, as we do at our house, in winter. Make sure that your cans are thoroughly sterilized.

PENNSYLVANIA FARMER PATTERNS

Give figures and letters of each pattern exactly as printed at beginning of each description or we will not be responsible for correct fitting of orders. Give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

3601.—Suit For Small Boys.—The pattern is cut in 4 sizes: 2, 3, 4 and 5 years. A 4-year size will require 1½ yard of 24-inch material for the blouse and 3 yards for the trousers. Linen, drill, gingham, seersucker, madras and percale are good for blouse and trousers. Serge, khaki and corduroy are also suitable for the trousers. Pattern, 10 cents.

3604.—Small Boy's Play Suit.—The pattern is cut in 4 sizes: 2, 3, 4 and 5 years. A 3-year size will require 2½ yards of 36-inch material. Seersucker, kindergarden cloth, drill, crash, poplin, madras, percale, and Indian head are good for this suit. Pattern, 10 cents.

3595.—Good Summer Play Dress.—The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. An 8-year size will require 2½ yards of 32-inch material for the dress in bloomer style with plain skirt it will require 2½ yards. The skirt may be finished in "bloomer" or "Turkish" style, or with lower edge unconfined. Gingham, poplin, repp, pongee, seersucker, percale, serge, plaid and check suitings are attractive for this design. Pattern, 10 cents.

3602.—Girl's One-piece Dress.—The pattern is cut in 4 sizes: 2, 4, 6 and 8 years. A 4-year size will require 2½ yards of 36-inch material. The sleeves may be finished in wrist or elbow length. Figured percale, gingham, seersucker, lawn, crepe or pongee. Pattern, 10 cents.

HOUSEHOLD HINTS
House Plans—Bulletin H-131 has hints on house-planning. It is published by N. Y. College of Agriculture at Ithaca, N. Y.

Borax vs. Flies.—Flies like garbage but they don't like borax. A tablespoon of borax to each cup of garbage will keep the flies away.

Color for Red Cheeks.—Make your complexion part of the color scheme of your wardrobe. The ruddy-cheeked woman will probably find quiet, cool colors most becoming.

Fruit Juice Drinks.—Beverages made from last year's fruit juices are now coming into use for hot weather drinks. If you have none on hand, don't be caught the same way next summer.

POULTRY

FEEDING CHICKS

I will be very much obliged if you will tell me what to use for a growing mash and scratch feed. As we live on a farm we have plenty of wheat, corn, oats and skimmed milk.—W. C. K., York Co., Pa.

A good mash for young chicks can be made of equal parts by weight of bran, middlings, corn meal and ground oats and beef scrap. The oats should be sifted to remove the bulky hulls. Here is a simple method of feeding young chicks if you do not wish to buy the commercial scratch feed. First week, rolled oats; second week, rolled oats, 2 parts; cracked wheat, 1 part; third week, rolled oats, 1 part, cracked wheat, 1 part; fourth week, rolled oats, 1 part; cracked wheat, 2 parts; fifth week, cracked wheat, 2 parts, cracked corn, one part. And from the beginning of the fourth week we find it pays to give the chicks all the cracked corn they will clean up at night. After they are five weeks old we have had good success in feeding mixtures of equal parts whole wheat and cracked corn.

For a small number of chicks the hand feed grinders are useful in grinding mash or cracking grains. For a large flock much work is saved by using a large grinder run by an engine. The poultryman can save money by grinding the home raised grains and very good results are obtained with vigorous chicks fed on the clean home grown feed. The commercial grain mixtures and mashers are useful if there is no time to make them at home. The writer believes that most of these commercial growing mashers should be lower in price to correspond with the present cost of grain.—R. K. K.

ROOSTER WITH BRONCHITIS

I would like you to tell me what is wrong with a Plymouth Rock rooster of mine. He can hardly make a sound when he tries to crow, also wheezes badly and has to open his mouth wide to get his breath. What is a good remedy?—E. R. S., Chenung Co., New York.

The rooster is probably suffering from bronchitis due to a cold or caused by infection from dust. Isolate the bird where he will be comfortable and protected from draughts. Give a tablespoonful of castor oil to which five drops of turpentine have been added. Treatment must begin early before the bird is emaciated or it is difficult to cure. Give soft feed such as bread and milk until the rooster shows signs of returning vigor. In very severe cases it is often best to kill the bird.—R. G. K.

RUPTURED OVIDUCT

Can you tell us what is the matter with our hens? We have lost quite a few in the last year and don't know what is the matter. They seem to get so heavy on the back end that they can hardly walk and finally get so they can't walk a day or two, then die. I think their bowels must be very loose for the feathers on their back end get so daubed up with manure. We feed oats, buckwheat and wheat and they have the run of the farm. Thanking you for your trouble.—Mrs. I. K., Tioga County, Pa.

The hens probably have ruptured

oviducts. It might be caused by an overfat condition followed by straining on the nest. The birds in such condition walk in a manner often described as penguin fashion. There is no cure and the hens should be killed when the condition is first noted. Then an inspection of the carcass can determine if it is fit for food. The condition can largely be prevented by culling out hens that bag down with fat and furnishing them with a balanced ration and plenty of exercise. Too much corn is the main cause of overfat hens. Such birds can often be reduced by penning them up and feeding a bran and water diet. Furnishing all the scratch litter helps to keep hens from becoming too fat. The best layers show a tendency to turn their feed into eggs and do not fatten so easily as some of the others.—R. G. Kirby.

FEEDING MILK TO HENS

The practice of feeding milk in some form to laying hens is becoming more and more general. In 1915 experiments conducted at the New Jersey Experiment Station to determine its influence by comparing the performance of laying hens fed on sour skim-milk with that of hens receiving no milk, showed very conclusively that milk has a definite place in the nutrition of the laying fowl. Its influence was probably caused first thru its being an excellent source of digestible food material, especially protein, and second, thru the stimulating and invigorating effect which it seems to have in building up a keen appetite and in promoting a greater consumption of food.

One test showed a difference in production for a year of 37 eggs per bird in favor of the milk-fed layers. This meant an increased profit, when the experiment was conducted, over and above food cost of \$1.56 per bird for the pen receiving no milk, as against \$2.68 for the pen receiving milk. These tests, measured in the number of superior eggs produced, indicated that the sour milk possessed nearly five times the value paid for it for feeding purposes; the price paid being 25 cents per 100 pounds.

The feeding of the milk to the laying hens seemed to keep them in better physical condition, lowering mortality and keeping them practically free from disease. It would seem that egg producers could well afford to pay 50 to 60 cents per 100 pounds for sour skim-milk to feed the layers. In the absence of a source of supply, it is unquestionably true that semi-solid buttermilk diluted and fed as a beverage, or even fed in a paste form, will make a very excellent substitute for the real milk product.

Milk is an economical, excellent and almost necessary adjunct to any poultry ration.

Spend a little time with your chickens. Teach them to eat choice morsels from your hand, to follow you while in the pen and then you will be able to handle them when you want to.

Don't allow the litter in your poultry house to become damp and badly broken up. It will cut down your egg production if you do.

SUMMIT PIPELESS FURNACE

No Cold Air Drafts Over Your Floors

In this great improvement over the old type of Pipeless furnace, the SUMMIT led the way. The special SUMMIT installation, eliminating cold air floor drafts, was the first, and it still stands as the best system on the market.

Reasonable in price, easy to install, economical in consumption of fuel, reliable at all times. Built of the best materials and sold to you under a broad guarantee. When you put a SUMMIT PIPELESS in your cellar you know that your house will be warm and comfortable.

No Cold Air Floor Drafts

The special SUMMIT installation does away with all cold air drafts over your floors. Two cold air returns placed at a distance from either side of the hot air register take in the cold air, which is returned to the heating surface of the furnace, without having to pass over the floors on its return.

Our Young People's Forum

A BIG PROJECT

All vocational school students and club members are familiar with project work, and know that there are projects of all kinds and sizes. There are livestock projects that take in everything from cattle to goats and others which include cotton raising, maple-sugar making, beekeeping and everything that goes between. Young people in club work alone raised \$1,321,581 worth of swine in 1919. But to get down to our subject, we have a letter this week from two girls who are conducting the biggest project we know of and they are making a success of it. They are running a big farm in Ocean County, New Jersey, and have entire charge of it themselves. In a note of explanation Miss Munnie Mullen, one of the girls, says:

"I am just twenty years old and am the manager. Miss Dove is my companion and partner." Things did not always go smoothly on this "project" but the girls decided that where there is a will there is a way and they set out to find the way. We will let them tell of their experiences:

Berkshire pig and two horses for driving. I also have sent for a registered purebred Holstein bull three months old which I expect here to-day. It seems that our luck has changed for no one could have better luck than we are having now. Last year this time we did not have any little chicks as our hens did not set until so late. We want to raise at least 500 this year. On this farm we have lots of fresh hay. If nothing happens we will have 50 tons and maybe more, besides tons of meadow hay. I don't do any of the field work. I used to, but it was too hard. We have 10 acres of corn planted on shares, from which I hope to get at least 150 bushels. This farm is along the bay shore and is very cool. I think later we will raise some Guernsey heifers. We sell about 20 quarts of milk a day which helps us with our expenses. We also have plenty of milk for our pig and chickens. The latter are growing fine and we have some large enough to eat. I think this will give you an idea now of what we girls are doing.—(Signed)

MISS MUNNIE A. MULLEN,
MISS MARION L. DOVE.

"We two girls liking outdoor life,

This Shows Miss Mullen, Miss Dove and a Friend With Some of the Calves and Their Pure-blooded Scotch Collie

and its pleasures, thought we would like cattle-raising along with chickens. We took a farm last March, one year ago, 1920. We had only two cows, 18 hens and one little horse to start with. We sold milk in town to get spending money. As we could not get any heifer calves to raise from around here we sent to New York and bought high grade calves of which we purchased five. We had fine luck in raising them. I fed them from a bucket, containing milk and ground oats.

"In the line of chickens, we raised a few more than one hundred from our eighteen hens and kept fifty nice ones to start with this year. It being our first year, it was quite an uphill job, for later in the summer a disease struck the horses and we lost three. That left us none and we didn't venture to buy, but later purchased one of a woman and it proved a stolen horse so I was out the price I paid for that one, too. Along with that we lost a big cow worth \$125.

It seemed as if luck was against us for the first year. But I was determined not to give up. Last December thirteenth we moved from that farm to a much better one of 700 acres. We have at the present time seven nice heifers, four cows, fifty hens, 150 little chicks, a nice

HARDING'S HOBBY

Scarcely anything in the everyday run of human affairs is much more interesting than a hobby, particularly if it chance to have in it something of advantage to those whose lives, it may be, are filled with stern duties. The President of the United States has a hobby. "If I can do anything to change disappointment into new hope," said Mr. Harding, speaking one afternoon to the Washington correspondent, "I shall have satisfied the best hobby a man can have in this world."

AVERAGE PENNA. ALTITUDE

The approximate mean elevation of Pennsylvania is 1100 feet. The highest point now known is Negro Mountain, in Somerset County, which is 3220 feet above the sea level. Until 1919, when the topographic survey of the area including Negro Mountain was made, Blue Mountain in Bedford County (elevation 3126 feet) was thought to be the highest point in the state. It is barely possible, as the topographic surveys are extended that still higher points may be found.

The surface of Delaware River where it leaves Pennsylvania is at sea level.

7—New York's Police Sergeant Spaulding, under the direction of Detroit's Commissioner of Police Carlleton Follen, M. D., now has a "Navy" to catch the dregs of the underworld who attempt to land narcotics from the country for illegal purposes. The police have confiscated hundreds of their sacks of dollars worth of drugs recently.

Of Interest to Farm Women and Girls

The Choice of a College

By HILDA RICHMOND

THE choice of a higher school or college should be a matter of interest to the parents some before the children are old enough to enter high school. There is a knowledge to be gained by observation and talking with those who have been to college, that helps the parents to exercise good judgment when their sons and daughters come to college age. "By their fruits ye shall know them," is as true of schools and colleges as of anything else in the world—trees or plants or persons—and the college that is turning out modest, studious, ambitious, industrious young men and women who are steadily climbing the ladder of success is safe, while the one that is frequented by idlers and persons interested only in style or athletics and that turns out uppish, conceited, irreverent graduates and has the reputation of allowing the young folks all the freedom and latitude to be found anywhere, is the college to be shunned.

Shall it be the little college or the

Asha Pauline Williams, Westmoreland Co., Pa.

big college? Both have much to commend them. There is an inspiration in the crowd that the little college never can have, while many thoughtful persons argue that the modest little school offers greater opportunities for the formation of character. Certain it is that where students and professors live together intimately, particularly in a small town, there is a strength of character imparted along with the book knowledge that the big school knows nothing about. In the very nature of things the man with hundreds of pupils in his classes daily can never be to those pupils what the man in the small college can be to his "boys and girls." The young people who were privileged to associate intimately with the great Horace Mann surely went on into the world with higher ideals than those who merely had a hazy acquaintance with the president of the large college. It could not be otherwise. The very contact with great people has a beneficial effect on the growing mind and developing character.

Particularly should a college frequented by very rich men's sons and daughters be avoided. The young folks from the farm may feel sure

that they are perfectly competent to keep their minds on their studies and off the frivolities that others have, but, depend upon it, it is far safer and wiser to select an institution where plain living and high thinking rule rather than clothes and automobiles. Many colleges have barred the luxuries of riding horses, automobiles, fine clothes and dissipation, but there are others which have not seen fit to furnish a wholesome lesson even to rich youths by demanding simplicity.

So, even if you have the money to spare, insist upon it that the young men and women from your household shall go to a school that stands for high character, that can show on its list of graduates men and women who are accomplishing things for humanity as well as those who have made money alone, that welcomes with open arms the young folks who must work their way thru, that has reverent, modest teachers well skilled in the studies they hope to impart to others and, above all, that has American ideals from start to finish. The boys and girls are leaving home for the first time and you want them to have the best surroundings that can be found. The old idea that young people should be thrust into temptation in order to prove their merit has happily passed away forever, and the people of today who can be saved from discontent and idleness and false ideals during those impressionable years from eighteen to twenty-two by the wise selection of a higher institution are the fortunate beings of earth, and the ones who will serve their day and generation best in the years to come.

It is not too early to begin hunting a good school for the toddler just starting to the first grade, nor too late to investigate for the young man or woman who is to set forth in a few months to complete his education. Find out all the good things about the college and do not be afraid to dig up the weak spots, and then you can rest assured that you have done your part in safeguarding your son and your daughter in the first journey into the great world outside the old home.

ATTRACTIVE CURRANT DISHES

Currant Dessert

Put two tablespoonfuls powdered gelatin into a saucepan, add 1 cup currant juice and 1 cup sugar; dissolve over a gentle fire, add half cup whole currants. Set on the ice until the mixture begins to thicken, then fold in 2 cups whipped cream and the stiffly beaten whites of two eggs. Pour into a wet mold, and set in a cool place to firm. Turn out when set, and decorate with a star of whipped and sweetened cream, sprinkled with a few ripe currants.

Currant Custard

Mash 1 quart of currants until soft, and add 1 cup sugar. Put 1 quart of milk in a double boiler, and when lukewarm add 3 well-beaten eggs, half cup sugar and 2 tablespoons corn starch moistened with a

little cold milk or cream. Stir until it thickens and boils about eight minutes, remove from the fire, add 1 teaspoon lemon juice and the currants, stir well. Serve cold.

Good Currant Pie

Line a pie tin with pastry, fill with stewed currants, sweetened well and flavored with a little nutmeg. Cover with puff paste and bake. Sprinkle with powdered sugar when serving.

Currant Ice Cream

Four cupfuls of thin cream, 1 cup sugar, 1 teaspoon lemon juice, a pinch of salt and 2 cups currants. Mix the ingredients, and freeze without cooking.

Boiled Currant Pudding

Line a buttered baking dish with rich biscuit dough rolled out one-half inch thick. Fill with red and white currants sprinkled well with sugar, and cover with a top crust. Pinch the edges of the crusts well together, tie over it a floured pudding cloth, and boil three hours in water, which must not cease boiling from the moment the pudding is put in until done. Serve with cream or a sweet sauce.

The Sauce—To make the sauce, beat the yolk of one egg until thick, add gradually half cup sifted gran-

Elizabeth Boyer, Schuylkill Co., Pa.

ulated sugar, beat thoroughly, then add 4 drops of orange flavor, and serve.

Currant Muffins

To two cups sifted flour, half cup sugar and a pinch of salt, add gradually three-fourths cup of sweet milk and two tablespoons melted butter. Then put in the yolks of two eggs and beat the mixture well. Now add two teaspoons baking-powder and the well-beaten whites of the eggs. Wash and dry 1 cup of firm currants, sprinkle lightly with flour, and add to the muffin batter.—Helen Lyman, Mass.

CANNING RHUBARB

To Can Cooked Rhubarb

It is not necessary to cook the rhubarb very much because the strong acid content will preserve it. Cook it only enough to reduce the bulk so that a lot can be put into each can. Sweeten it or not, as you prefer. You will find that if the sugar is cooked into the rhubarb before canning it will require a little less sugar than when you put it in, unless you heat it in before serving. With the sugar cooked in before canning, the rhubarb is ready to serve as cold sauce at once. However, you may like hot rhubarb sauce, as we do at our house, in winter. Make sure that your cans are thoroughly sterilized.

3601.—Suit For Small Boys.—The pattern is cut in 4 sizes: 2, 3, 4 and 5 years. A 4-year size will require 1 1/2 yards of 36-inch material for the blouse and 3 yards for the trousers. Linen, drill, gingham, seersucker, madras and percale are good for blouse and trousers. Serge, khaki and corduroy are also suitable for the trousers. Pattern, 10 cents.

3604.—Small Boy's Play Suit.—The pattern is cut in 4 sizes: 2, 3, 4 and 5 years. A 3-year size will require 2 1/2 yards of 36-inch material. Seersucker, kindergarten cloth, drill, crash, poplin, madras, percale, and Indian head are good for this suit. Pattern, 10 cents.

3595.—Good Summer Play Dress.—The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. An 8-year size will require 2 1/2 yards of 32-inch material for the dress in bloomer style with plain skirt it will require 2 3/4 yards. The skirt may be finished in "bloomer" or "Turkish" style, or with lower edge unconfined. Gingham, poplin, repp, pongee, seersucker, percale, serge, plaid and check suiting are attractive for this design. Pattern, 10 cents.

3602.—Girl's One-piece Dress.—The pattern is cut in 4 sizes: 2, 4, 6 and 8 years. A 4-year size will require 2 1/2 yards of 36-inch material. The sleeves may be finished in wrist or elbow length. Figured percale, gingham, seersucker, lawn, crepe or pongee. Pattern, 10 cents.

HOUSEHOLD HINTS

House Plans—Bulletin H-131 has hints on house-planning. It is published by N. Y. College of Agriculture at Ithaca, N. Y.

Borax vs. Flies.—Flies like garbage but they don't like borax. A tablespoon of borax to each peck of garbage will keep the flies away.

Color for Red Cheeks.—Make your complexion part of the color scheme of your wardrobe. The ruddy-cheeked woman will probably find quiet, cool colors most becoming.

Fruit Juice Drinks.—Beverages made from last year's fruit juices are now coming into use for hot weather drinks. If you have none on hand, don't be caught the same way next summer.

POULTRY

FEEDING CHICKS

I will be very much obliged if you will tell me what to use for a growing mash and scratch feed. As we live on a farm we have plenty of wheat, corn, oats and skinned milk. —W. C. K., York Co., Pa.

A good mash for young chicks can be made of equal parts by weight of bran, middlings, corn meal and ground oats and beef scrap. The oats should be sifted to remove the bulky hulls. Here is a simple method of feeding young chicks if you do not wish to buy the commercial scratch feed. First week, rolled oats; second week, rolled oats, 2 parts; cracked wheat, 1 part; third week, rolled oats, 1 part, cracked wheat, 1 part; fourth week, rolled oats, 1 part; cracked wheat, 2 parts; fifth week, cracked wheat, 2 parts, cracked corn, one part. And from the beginning of the fourth week we find it pays to give the chicks all the cracked corn they will clean up at night. After they are five weeks old we have had good success in feeding mixtures of equal parts whole wheat and cracked corn.

For a small number of chicks the hand feed grinders are useful in grinding mash or cracking grains. For a large flock much work is saved by using a large grinder run by an engine. The poultryman can save money by grinding the home raised grains and very good results are obtained with vigorous chicks fed on the clean home grown feed. The commercial grain mixtures and mashes are useful if there is no time to make them at home. The writer believes that most of these commercial growing mashes should be lower in price to correspond with the present cost of grain.—R. K. K.

ROOSTER WITH BRONCHITIS

I would like you to tell me what is wrong with a Plymouth Rock rooster of mine. He can hardly make a sound when he tries to crow, also wheezes badly and has to open his mouth wide to get his breath. What is a good remedy?—E. R. S., Chemung Co., New York.

The rooster is probably suffering from bronchitis due to a cold or caused by infection from dust. Isolate the bird where he will be comfortable and protected from draughts. Give a tablespoonful of castor oil to which five drops of turpentine have been added. Treatment must begin early before the bird is emaciated or it is difficult to cure. Give soft feed such as bread and milk until the rooster shows signs of returning vigor. In very severe cases it is often best to kill the bird. —R. G. K.

RUPTURED OVIDUCT

Can you tell us what is the matter with our hens? We have lost quite a few in the last year and don't know what is the matter. They seem to get so heavy on the back end that they can hardly walk and finally get so they can't walk a day or two, then die. I think their bowels must be very loose for the feathers on their back end get so daubed up with manure. We feed oats, buckwheat and wheat and they have the run of the farm. Thanking you for your trouble.—Mrs. I. K., Tioga County, Pa.

The hens probably have ruptured

oviducts. It might be caused by an overfat condition followed by straining on the nest. The birds in such condition walk in a manner often described as penguin fashion. There is no cure and the hens should be killed when the condition is first noted. Then an inspection of the carcass can determine if it is fit for food. The condition can largely be prevented by culling out hens that bag down with fat and furnishing them with a balanced ration and plenty of exercise. Too much corn is the main cause of overfat hens. Such birds can often be reduced by penning them up and feeding a bran and water diet. Furnishing all the scratch litter helps to keep hens from becoming too fat. The best layers show a tendency to turn their feed into eggs and do not fatten so easily as some of the others.—R. G. Kirby.

FEEDING MILK TO HENS

The practice of feeding milk in some form to laying hens is becoming more and more general. In 1915 experiments conducted at the New Jersey Experiment Station to determine its influence by comparing the performance of laying hens fed on sour skim-milk with that of hens receiving no milk, showed very conclusively that milk has a definite place in the nutrition of the laying fowl. Its influence was probably caused first thru its being an excellent source of digestible food material, especially protein, and second, thru the stimulating and invigorating effect which it seems to have in building up a keen appetite and in promoting a greater consumption of food.

One test showed a difference in production for a year of 37 eggs per bird in favor of the milk-fed layers. This meant an increased profit, when the experiment was conducted, over and above food cost of \$1.56 per bird for the pen receiving no milk, as against \$2.68 for the pen receiving milk. These tests, measured in the number of superior eggs produced, indicated that the sour milk possessed nearly five times the value paid for it for feeding purposes; the price paid being 25 cents per 100 pounds.

The feeding of the milk to the laying hens seemed to keep them in better physical condition, lowering mortality and keeping them practically free from disease. It would seem that egg producers could well afford to pay 50 to 60 cents per 100 pounds for sour skim-milk to feed the layers. In the absence of a source of supply, it is unquestionably true that semi-sold buttermilk diluted and fed as a beverage, or even fed in a paste form, will make a very excellent substitute for the real milk product.

Milk is an economical, excellent and almost necessary adjunct to any poultry ration.

Spend a little time with your chickens. Teach them to eat choice morsels from your hand, to follow you while in the pen and then you will be able to handle them when you want to.

Don't allow the litter in your poultry house to become damp and badly broken up. It will cut down your egg production if you do.

SUMMIT PIPELESS FURNACE

No Cold Air Drafts Over Your Floors

In this great improvement over the old type of Pipeless furnace, the SUMMIT led the way. The special SUMMIT installation, eliminating cold air floor drafts, was the first, and it still stands as the best system on the market.

Reasonable in price, easy to install, economical in consumption of fuel, reliable at all times. Built of the best materials and sold to you under a broad guarantee. When you put a SUMMIT PIPELESS in your cellar you know that your house will be warm and comfortable.

No Cold Air Floor Drafts

The special SUMMIT installation does away with all cold air drafts over your floors. Two cold air returns placed at a distance from either side of the hot air register take in the cold air, which is returned to the heating surface of the furnace, without having to pass over the floors on its return.

FARMS Poultry, truck, stock and grain farms cheap. **FIGGS & NOCK, Salisbury, Maryland.**

Our Young People's Forum

A BIG PROJECT

All vocational school students and club members are familiar with project work, and know that there are projects of all kinds and sizes. There are livestock projects that take in everything from cattle to goats and others which include cotton raising, maple-sugar making, beekeeping and everything that goes between. Young people in club work alone raised \$1,321,581 worth of swine in 1919. But to get down to our subject, we have a letter this week from two girls who are conducting the biggest project we know of and they are making a success of it. They are running a big farm in Ocean County, New Jersey, and have entire charge of it themselves. In a note of explanation Miss Munnie Mullen, one of the girls, says:

"I am just twenty years old and am the manager. Miss Dove is my companion and partner." Things did not always go smoothly on this "project" but the girls decided that where there is a will there is a way and they set out to find the way. We will let them tell of their experiences:

"We two girls liking outdoor life,

Berkshire pig and two horses for driving. I also have sent for a registered purebred Holstein bull three months old which I expect here today. It seems that our luck has changed for no one could have better luck than we are having now. Last year this time we did not have any little chicks as our hens did not set until so late. We want to raise at least 500 this year. On this farm we have lots of fresh hay. If nothing happens we will have 50 tons and maybe more, besides tons of meadow hay. I don't do any of the field work. I used to, but it was too hard. We have 10 acres of corn planted on shares, from which I hope to get at least 150 bushels. This farm is along the bay shore and is very cool. I think later we will raise some Guernsey helpers. We sell about 20 quarts of milk a day which helps us with our expenses. We also have plenty of milk for our pig and chickens. The latter are growing fine and we have some large enough to eat. I think this will give you an idea now of what we girls are doing.—(Signed)

MISS MINNIE A. MULLEN,
MISS MARION L. DOVE.

This Shows Miss Mullen, Miss Dove and a Friend With Some of the Calves and Their Pure-blooded Scotch Collie

and its pleasures, thought we would like cattle-raising along with chickens. We took a farm last March, one year ago, 1920. We had only two cows, 18 hens and one little horse to start with. We sold milk in town to get spending money. As we could not get any heifer calves to raise from around here we sent to New York and bought high grade calves of which we purchased five. We had fine luck in raising them. I fed them from a bucket, containing milk and ground oats.

"In the line of chickens, we raised a few more than one hundred from our eighteen hens and kept fifty nice ones to start with this year. It being our first year, it was quite an uphill job, for later in the summer a disease struck the horses and we lost three. That left us none and we didn't venture to buy, but later purchased one of a woman and it proved a stolen horse so I was out the price I paid for that one, too. Along with that we lost a big cow worth \$125.

It seemed as if luck was against us for the first year. But I was determined not to give up. Last December thirteenth we moved from that farm to a much better one of 700 acres. We have at the present time seven nice heifers, four cows, fifty hens, 150 little chicks, a nice

HARDING'S HOBBY

Scarcely anything in the everyday run of human affairs is much more interesting than a hobby, particularly if it chance to have in it something of advantage to those whose lives, it may be, are filled with stern duties. The President of the United States has a hobby. "If I can do anything to change disappointment into new hope," said Mr. Harding, speaking one afternoon to the Washington correspondent, "I shall have satisfied the best hobby a man can have in this world."

AVERAGE PENNA. ALTITUDE

The approximate mean elevation of Pennsylvania is 1100 feet. The highest point now known is Negro Mountain, in Somerset County, which is 3220 feet above the sea level. Until 1919, when the topographic survey of the area including Negro Mountain was made, Blue Mountain in Bedford County (elevation 3136 feet) was thought to be the highest point in the state. It is barely possible, as the topographic surveys are extended that still higher points may be found.

The surface of Delaware River where it leaves Pennsylvania is at sea level.

The Valley of the Giants

By PETER B. KYNE

Synopsis—John Cardigan, a middle-aged man—a giant in frame and mind—was a pioneer settler along the Pacific coast in Humboldt County, California, in 1850. His business was cutting the giant trees into lumber. His young wife died and was buried among the redwoods in "The Valley of the Giants" as he called the spot which he loved and preserved as a shrine to her memory. Bryce, Cardigan's only son, was an ultimate chum of his father—who planned that he should inherit the great lumber business which he had built up. Bryce had a brief love affair with Shirley Sumner, a victor to the neighborhood, but she was soon forgotten. Cardigan tried to buy a tract of timber adjoining his and refused to be bluffed into raising his offer for it. He determined to move his mill to the San Hedrin watershed and start logging operations there. Bryce, after four years of college in the East, and two years of travel abroad returned to Sequoia. He was met at the train by George Sea Otter. Bryce developed an interest in a young woman who got off the train with him and found no man who met her. He learned that she was Shirley Sumner and she accepted his invitation to ride to Sequoia with him. Upon arriving home he found that his father had been nearly blind for two years and that he was in danger of losing his redwoods to his competitor, Colonel Pennington.

Chapter IX

"I'll not throw in with you, Bill, at my time of life. I don't want to have the worry of building, maintaining, and operating twelve miles of private railroad. But I'll loan you, without security—"

"You'll have to take an unsecured note, John. Everything I've got is hooked."

"—the money you need to build and equip the road," finished Cardigan. "In return you are to shoulder all the grief and worry of the road and give me a ten-year contract at a dollar and a half per thousand feet, to haul my logs down to tidewater with your own. My minimum haul will be twenty-five million feet annually, and my maximum fifty million."

"Sold!" cried Henderson. And it was even so.

Bryce came out of his reverie. "And now?" he queried of his father.

"I mortgaged the San Hedrin timber in the south to buy the timber in the north, my son; then after I commenced logging in my new holdings, came several long, lean years of famine. I stuck it out, hoping for a change for the better; I couldn't bear to close down my mill and logging-camps, for the reason that I could stand the loss far more readily than the men who worked for me and depended upon me. But the market dragged in the doldrums, and Bill Henderson died, and his boys got discouraged, and—"

A sudden flash of inspiration illumined Bryce Cardigan's brain. "And they sold out to Colonel Pennington," he cried.

"Exactly. The Colonel took over my contract with Henderson's company, along with the other assets, and it was incumbent upon him, as assignee, to fulfill the contract. For the past two years the market for redwood has been most gratifying, and if I could only have gotten a maximum supply of logs over Pennington's road, I'd worked out of the hole, but—"

"He manages to hold you to a minimum annual haul of twenty-five million feet, eh?"

John Cardigan nodded. "He claims he's short of rolling-stock—that wrecks and fires have embarrassed the road. He can always find excuses for failing to spot in logging-trucks for Cardigan's logs. Bill Henderson never played the game that way. He gave me what I wanted and never held me to the minimum haulage when I was prepared to give him the maximum."

"What does Colonel Pennington want, pard?"

"He wants," said John Cardigan slowly, "my Valley of the Giants and a right of way thru my land from

the valley to a log-dump on deep water."

"And you refused him?"

"Naturally. You know my ideas on that big timber." His old head sank low on his breast. "Folks call them Cardigan's Redwoods now," he murmured. "Cardigan's Redwoods—and Pennington would cut them! Oh, Bryce, the man hasn't a soul!"

"But I fail to see what the loss of Cardigan's Redwoods has to do with the impending ruin of the Cardigan Redwood Lumber Company," his son reminded him. "We have all the lumber we want."

"My ten-year contract has but one more year to run, and recently I tried to get Pennington to renew it. He was very nice and sociable, but—he named me a freight rate, for a renewal of the contract for five years, of three dollars per thousand feet. That rate is prohibitive and puts us out of business."

"Not necessarily," Bryce returned evenly. "How about the State railroad commission? Hasn't it got

"I'm mortgaged to the last penny," he confessed, "and Pennington has been buying Cardigan Redwood Lumber Company first-mortgage bonds until he is in control of the issue. He'll buy in the San Hedrin timber at the foreclosure sale, and in order to get it back and save something for you out of the wreckage, I'll have to make an unprofitable trade with him. I'll have to give him my timber adjoining his north of Sequoia, together with my Valley of the Giants, in return for the San Hedrin timber, to which he'll have a sheriff's deed. But the mill, all my old employees, with their numerous dependents—gone, with you left land-poor and without a dollar to pay your taxes. Smashed—like that! And he drove his fist into the palm of his hand."

"Perhaps—but not without a fight," Bryce answered, altho he knew their plight was well-nigh hopeless. "I'll give that man Pennington a run for his money, or I'll know the reason."

The telephone on the table beside him tinkled, and he took down the receiver and said "Hello!" "Mercy!" came the clear, sweet voice of Shirley Sumner over the wire. "Do you feel as savage as all that, Mr. Cardigan?"

For the second time in his life the

another. Some evening next week, when that dear old daddy of yours can spare his boy, you might be interested to see our hurl-redwood-paneled dining room Uncle Seth is so proud of. I'm too recent an arrival to know the hour at which Uncle Seth dines, but I'll let you know later and name a definite date. Would Thursday night be convenient?"

"Perfectly. Thank you a thousand times."

She bade him good-night. As he turned from the telephone, his father looked up. "What are you going to do tomorrow, lad?" he queried.

"I have to do some thinking tomorrow," Bryce answered. "So I'm going up into Cardigan's Redwoods to do it. Up there a fellow can get set, as it were, to put over a thought with a punch in it."

"The dogwoods and rhododendron are blooming now," the old man murmured wistfully. Bryce knew what he was thinking of. "I'll attend to the flowers for Mother," he assured Cardigan, and he added fiercely: "And I'll attend to the battle for Father. We may lose, but that man Pennington will know he's been in a fight before we fin—"

He broke off abruptly, for he had just remembered that he was to dine at the Pennington house the following Thursday—and he was not the sort of man who smilingly breaks bread with his enemy.

Chapter X

For many years there had been installed in Cardigan's mill a clock set to United States observatory time and corrected hourly by the telegraph company. It was the only clock of its kind in Sequoia; hence folk set their watches by it, or rather by the whistle on Cardigan's mill. With a due appreciation of the important function of this clock toward his fellow-citizens, old Zeb Curry, the chief engineer and a stickler for being on time, was most meticulous in his whistle-blowing. With a sage and prophetic eye fixed upon the face of the clock, and a particularly greasy hand grasping the whistle-cord, Zeb would wait until the clock registered exactly six-fifty-nine and a half—whereupon the seven o'clock whistle would commence blowing, to cease instantly upon the stroke of the hour.

It was old Zeb's pride and boast that with a single exception, during the sixteen years the clock had been in service, no man could say that Zeb had been more than a second late or early with his whistle-blowing. That exception occurred when Bryce Cardigan, invading the engine room while Zeb was at luncheon, looped the whistle-cord until the end dangled seven feet above ground. As a consequence Zeb, who was a short, fat little man, was forced to leap at it several times before success crowned his efforts and the whistle blew. Thereafter for the remainder of the day his reason tottered on its throne, due to the fact that Bryce induced every mill employee to call upon the engineer and remind him that he must be growing old, since he was no longer dependable!

On the morning following Bryce Cardigan's return to Sequoia, Zeb Curry, as per custom, started his engine at six fifty-eight. That gave the huge bandsaws two minutes in which to attain their proper speed and afforded Dan Kenyon, the head sawyer, ample time to run his steam log-carriage out to the end of the track; for Daniel, too, was a reliable

man in the matter of starting his daily uproar on time.

At precisely six fifty-nine and a half, therefore, the engineer's hand closed over the handle of the whistle-cord, and Dan Kenyon, standing on the steam-carriage with his hand on the lever, took a thirty-second squint thru a rather grimy window that gave upon the drying-yard and the mill-office at the head of it.

The whistle ceased blowing, but still Dan Kenyon stood at his post, oblivious of the hungry saws. Ten seconds passed; then Zeb Curry, immeasurably scandalized at Daniel's tardiness, tooted the whistle sharply twice; whereupon Dan woke up, threw over the lever, and walked his log up to the saw.

The next five hours Zeb Curry had no opportunity to discuss the matter with the head sawyer. After blowing the twelve o'clock whistle, however, he hurried over to the dining-hall, where the mill hands already lined the benches, shoveling food into their mouths as only a lumberman or a miner can. Dan Kenyon sat at the head of the table in the place of honor sacred to the head sawyer, and when his mouth would permit of some activity other than mastication, Zeb Curry caught his eye.

"Hey, you, Dan Kenyon," he shouted across the table, "what happened to you this mornin'? It was sixteen seconds between the tail end o' my whistle an' the front end o' your whinin'. First thing you know, you'll be gettin' so slack an' careless-like some other man'll be ridin' that log-carriage o' yours."

"I was struck dumb," Dan Kenyon replied. "I just stood there like one o' these here graven images. Last night on my way home from work I heard the young feller was back—he got in just as we was knockin' off for the day; an' this mornin' just as you cut loose, Zeb, I'll be danged if he didn't show up in front of the office door, fumblin' for the keyhole. Yes, sirree! That boy gets in at six o'clock last night an' turns to on his paw's job when the whistle blows this mornin' at seven."

"You mean young Bryce Cardigan?" Zeb queried incredulously.

"I shore do."

"Taint possible," Zeb declared. "You seen a new bookkeeper, mebby, but you didn't see Bryce. He aint no such hog for labor as his daddy before him, I'm tellin' you. Not that there's a lazy bone in his body, for there aint, but because that there boy's got too much sense to come bollin' down to work at seven o'clock the very first mornin' he's back from Yurrupe."

"I'm layin' you ten to one I seen him," Dan replied defiantly, "an' what's more, I'll bet a good cigar—a ten-center straight—the boy don't leave till six o'clock tonight."

"You're on," answered the chief engineer. "Them's lumberjack hours, man. From seven till six means work—an' only fools an' hosses keeps them hours."

The head sawyer leaned across the table and pounded with the handle of his knife until he had the attention of all present. "I'm a-goin' to tell you young fellers somethin'," he announced. "Ever since the old boss got so he couldn't look after his business with his own eyes, things has been goin' to blazes round this saw-mill, but they ain't a-goin' no more. How do I know? Well, I'll tell you. All this forenoon I kept my eye on the office door—I can see it thru a mill window; an' I'm tellin' you the old boss didn't show up till ten o'clock, which the old man aint

never been a ten o'clock business man at no time. Don't that prove the boy's took his place?"

Confused murmurs of affirmation and negation ran up and down the long table. Dan tapped with his knife again. "You hear me," he warned. "Thirty year I've been ridin' John Cardigan's log-carriages; thirty year I've been gettin' everythin' out of a log it's possible to git out, which is more'n you fellers at the trimmers can git out of a board after I've sawed it off the cant. There's a lot o' you young fellers that've been takin' John Cardigan's money under false pretenses, so if I was you I'd keep both eyes on my job hereafter. For a year I've been clamin' that good No. 2 stock has been chucked into the slab-fire as refuge lumber." (Dan meant refuse lumber). "But it won't be done no more. The raftsmen tells me he seen Bryce down at the end o' the conveyin' belt givin' that refuge the once over—so step easy."

"What does young Cardigan know about runnin' a sawmill?" a planer-man demanded bluntly. "They tell me he's been away to college an' travelin' the past six years."

"Wa-ll," drawled the head sawyer, "you git to talkin with him some day an' see how much he knows about runnin' a sawmill. What he knows will surprise you. Yes, indeed, you'll find he knows considerable. He's picked up loose shingles around the yard an' bundled 'em in vacation times, an' I want to see the shingle-weaver that can teach him some tricks. Also, I've had him come up on the steam carriage more'n once an' saw up logs, while at times I've seen him put in a week or two on the sortin' table. In a pinch, with a lot o' vessels loadin' here at the dock an' the skippers raisin' Cain because they wasn't gettin' their cargo fast enough, I've seen him work nights an' Sundays tallyin' with the best o' them. Believe me that boy can grade lumber."

"An' I'll tell you somethin' else," Zeb Curry cut in. "If the new boss ever tells you to do a thing his way, you do it an' don't argue none as to whether he knows more about it than you do or not."

"A whole lot o' dagos an' bohunks that's come into the woods since the blue-noses an' cannicks an' wild Irish went out had better keep your eyes open," Dan Kenyon warned safely. "There aint no one o' you any better'n you ought to be, an' things have been pretty durned slack around Cardigan's mill since the old man went blind, but—you watch out. There's a change due. Bryce Cardigan is his father's son. He'll do things."

"Which he's big enough to throw a bear uphill by the tail," Zeb Curry added, "an' you fellers all know how much tail a bear has."

"Every mornin' for thirty years, 'ceptin' when we was shut down for repairs," Dan continued, "I've looked thru that window, when John Cardigan wasn't away from Sequoia, to watch him git to his office on time. He's there when the whistle blows, clear up to the time his eyes go back on him, an' then he arrives late once or twice on account o' havin' to go careful. This mornin', for the first time in fifty year, he stays in bed; but—his son has the key in the office door when the whistle blows, an'—"

Dan Kenyon paused abruptly; the hum of conversation ceased, and silence fell upon the room as Bryce Cardigan strolled in the door, nodded to the men, and slid in on the bench to a seat beside the head sawyer.

"Hello Dan—hello Zeb," he said

and shook hands with each. "I'm mighty glad to see you both again. Hello, everybody. I'm the new boss, so I suppose I'd better introduce myself—there are so many new faces here. I'm Bryce Cardigan."

"Yes," Zeb Curry volunteered, "an' he's like his daddy. He ain't ashamed to work with his men, an' he ain't ashamed to eat with his men, either. Glad you're back with us again, boy—mighty glad. Dan, here, he's gittin' slacken'n an old squaw with his work an' needs somebody to jerk him up, while the rest o' these here—"

"I noticed that about Dan," Bryce interrupted craftily. "He's slowing up, Zeb. He must have been fifteen seconds late this mornin'—or perhaps," he added, "you were fifteen seconds earlier than the clock."

Dan grinned, and Bryce went on seriously: "I'm afraid you're getting too old to ride the log-carriage, Dan. You've been at it a long time; so, with the utmost good will in the world toward you, you're fired. I might as well tell you now. You know me, Dan. I always did dislike beating about the bush."

"Fired!" Dan Kenyon's eyes popped with amazement and horror.

"Fired—after thirty years!" he croaked.

"Fired!" There was unmistakable finality in Bryce's tones. "You're hired again, however, at a higher salary, as mill-superintendent. You can get away with that job, can't you, Dan? In fact," he added without waiting for the overjoyed Dan to answer him, "you've got to get away with it, because I discharged the mill-superintendent I found on the job when I got down here this mornin'. He has been letting too many profits go into the slab-fire. In fact, the entire plant has gone to glory. Fire-hose old and rotten—couldn't stand a hundred-pound pressure; fire-buckets and water-barrels empty, axes not in their proper places, fire-extinguishers filled with stale chemical—why, the smallest kind of a fire here would get beyond our control with that man on the job. Besides, he's changed the gradin'-rules. I found the men putting clear boards with hard-grained streaks in them in with the No. 1 clear. The custom may not kick at a small percentage of No. 2 in his No. 1 but it's only fair to give it to him at two dollars a thousand less."

"Well," purred Zeb Curry, "they don't grade lumber as strict nowadays as they used to before you went away. Colonel Pennington says we're a lot o' back numbers out this way an' too generous with our grades. First thing he did was to call a meetin' of all the Humboldt lumber manufacturers an' organize 'em into an association. Then he had the gradin'-rules changed. The retailers hollered for a while, but bimeby they got used to it."

"Did my father join that association?" Bryce demanded quickly.

"Yes. He told Pennington he wasn't goin' to be no obstructionist in the trade, but he did kick like a bay steer on them new gradin'-rules an' refused to conform to 'em. Said he was too old an' had been too long in business to start goug'n' his customers at his time o' life. So he got out o' the association."

"Bully for John Cardigan!" Bryce declared. "I suppose we could make a little more money by cheapening our grade, but the quality of our lumber is so well known that it sells itself and saves us the expense of maintaining a corps of salesmen."

"From what I hear tell o' the Col-

onel," Dan observed sagely, "the least he ever wants is a hundred and fifty per cent the best of it."

"Yes," old Zeb observed gravely, "an' so far as I can see, he ain't none too particular how he gets it." He helped himself to a toothpick, and followed by the head sawyer, abruptly left the room—after the fashion of sawmill men and woodsmen, who eat as much as they can as quickly as they can and eventually die of old age rather than indigestion. Bryce ate his noonday meal in more leisurely fashion and at its conclusion stepped into the kitchen.

"Where do you live, cook?" he demanded of that functionary; and upon being informed, he retired to the office and called up the Sequoia meat-market.

"Bryce Cardigan speaking," he informed the butcher. "Do you ever buy any pigs from our mill cook?"

"Not any more," the butcher answered. "He stung me once with a dozen fine shoats. They looked great, but after I had slaughtered them and had them dressed, they turned out to be swill-fed hogs—swill and alfalfa."

"Thank you," Bryce hung up. "I knew that cook was wasteful," he declared, turning to his father's old manager, one Thomas Sinclair. "He wastes food in order to take the swill home to his hogs—and nobody watches him. Things have certainly gone to the devil," he continued.

"No fault of mine," Sinclair protested. "I've never paid any attention to matters outside the office. Your father looked after everything else."

Bryce looked at Sinclair. The latter was a thin, spare, nervous man in the late fifties, and the generally credited with being John Cardigan's manager. Bryce knew that Sinclair was in reality little more than a glorified bookkeeper—and a very excellent bookkeeper indeed. Bryce realized that in the colossal task that confronted him he could expect no real help from Sinclair.

"Yes," he replied, "my father looked after everything else—while he could."

"Oh, you'll soon get the business straightened out and running smoothly again," Sinclair declared confidently.

"Well, I'm glad I started on the job today, rather than next Monday, as I planned to do last night."

He stepped to the window and looked out. At the mill-dock a big steam schooner and a wind-jammer lay; in the lee of the piles of lumber, sailors and longshoremen, tally-men and timekeeper lounged, enjoying the brief period of the noon hour still theirs before the driving mates of the lumber-vessels should turn them to on the job once more. To his right and left stretched the drying yard, gangway on gangway formed by the serried rows of lumber-piles, the hoop-horses placidly feeding from their nosebags while the strong-armed fellows who piled the lumber sat about in little groups conversing with the mill-hands.

As Bryce looked, a puff of white steam appeared over the roof of the old sawmill, and the one o'clock whistle blew. Instantly that scene of indolence and ease turned to one of activity. The mill-hands lounging in the gangways scurried for their stations in the mill; men climbed to the tops of the lumber-piles, while other men passed boards and scantlings up to them; the donkey-engines aboard the vessels rattled; the cargo-rafts of the steam schooner swung outward and inward with sling-loads of lumber.

(Continued Next Week.)

A RURAL MILK CAMPAIGN

During the week of May 15-21 an unusually successful milk campaign was conducted in Walworth County, Wisconsin, where the message of milk, the fundamental food, was carried into every home in the entire county.

Full co-operation was received from everybody, the mayors issued proclamations, the schools made milk posters and staged the Milk Fairy Play, the business men dressed their windows in "milk attire"—using the very splendid posters made by the schools and the National Dairy Council; they also tied their advertisements up with the Milk Week propaganda; the nine newspapers carried feature articles and advertisements; the picture shows co-operated in running milk films and slides; the local citizens gave support, likewise the women's clubs, the churches, and all other organizations within the county.

During the milk week there were 92 meetings held, addressed by 16 speakers, furnished by the organizations conducting the campaign. Preparatory to the mass meetings held each evening, oftentimes a parade was held.

The closing of the campaign came on Saturday at the county seat, where the band furnished music during the entire day, and where bread, butter and cheese sandwiches and ice cream cones were given away to nearly 10,000 people, who gathered for the festivities. Among other attractions, came the Milk Fairy Play, which was staged in the open in a very beautiful and pleasing manner.

The final results are not yet compiled, but preliminary reports indicate the campaign brought the following results: (1) An increase of 22 per cent in sales of brick ice cream for home consumption; (2) An increase of 19 per cent in consumption of butter; (3) An increase of 18 per cent in consumption of fluid milk; (4) An increase of 30 per cent in consumption of cheese; (5) A falling off of 34 per cent in the sale of so-called butter substitutes.

This seems to be the first county in the United States to put on a milk campaign upon so broad and comprehensive a basis. The need of such campaigns is very evident and the results that can be secured will justify other organizations in promoting this important work.

CARROLL COUNTY, MD. NOTES

Warm, dry weather which prevails is favorable for crop growth. Altho crops are in good condition, a good rain would prove a benefit. Wheat and rye are ripening. Barley is being harvested. Clover is being cut for hay; red clover appears to have been affected more by the freeze than alsike. Prospects are good for a large crop of timothy hay. Peas and strawberries are being harvested. The demand for strawberries exceeds the supply, prices ranging from 20 to 25c per box. Tomato and sweet potato plants are being set out. The acreage of tomatoes will be decreased while the acreage of sweets will probably be increased. Eggs are 20c dozen; young chickens, 40c lb.; old hens, 24c lb.; old potatoes have advanced to 60c bu. Wheat is quoted as \$1.40 bu.—Harry L. Rinehart.

Eggs that are gathered often, kept clean and cool and are candled and graded bring the best price.

Firestone

30x3½ Standard Non-Skid Tire

\$13.95

This new low price is made possible by strictest economies and specialized production.

Plant No. 2 was erected for the sole purpose of making 30x3½-inch Non-Skid fabric tires. With a daily capacity of 16,000

tires and 20,000 tubes, this plant permits refined production on a quantity basis.

All materials used are the best obtainable. The quality is uniform. It is the best fabric tire ever offered to the car owner at any price.

Firestone Cord Tires

Tire repair men, who judge values best, class these tires as having the sturdiest carcass made. Forty-seven high-grade car manufacturers use them as standard equipment. They are the quality choice of cord users.
